BULLETIN OF THE AMERICAN BERKSHIRE ASSOCIATION.—This is published at Springfield, Illinois, bi-monthly, and contains much useful information, not only to the breeders of Berkshire swine, but to those of all others. It was commenced in May, 1878, at one dollar per annum. It has attained a circulation, we are informed, of over 3,000, which is so rapidly increasing, that it is the intention of the Association to soon issue it monthly. In the last number we notice a recommendation of feeding a greater proportion of nitrogenous food to the growing pigs, than has heretofore been practiced at the West—such as peas, beans, oats, skim-milk, butter-milk, whey, etc. These, with plenty of exercise in a good grass lot, make better bones, and leaner, tenderer meat than corn, which has heretofore been the almost exclusive diet of Western swine. This last, together with foul, contracted yards, have undoubtedly been the cause of much of the cholera and other fatal diseases prevailing so extensively in the regions of the West.

Veterinary

ABORTION IN COWS—I.

D. E. SALMON, D. V. M.

THERE is no doubt that the losses from abortion are a very serious drawback in many of our best dairy districts. The disease seems to have appeared in New York State about a quarter of a century ago, and as long ago as 1866, it was estimated that such losses in that State alone amounted to nearly five millions of dollars; but New York is not the only State that suffers from the scourge. It has been

alarmingly frequent in Massachusetts, Pennsylvania, Ohio, Indiana and Illinois, and the affected area seems to be continually increasing in size. If I have been rightly informed, it is only within the last few years that the dairymen of the States west of Ohio have suffered from its ravages. In the Southern States, I have only heard of it in exceptional cases.

A Commission was appointed to investigate the disease in New York fourteen years ago, and considerable information was collected in regard to the more apparent phenomena of the trouble, but no discoveries were made that would enable the farmer to control it. If this commission had been composed of veterinarians, instead of physicians, it is possible that more would have been accomplished; for, with due respect to the medical profession, it must be admitted that physicians cannot be as well qualified for investigating the diseases of animals, as are those who make these a specialty. The Pennsylvania Board of Agriculture has, also, had a committee at work on this matter during the last year, I believe, if, indeed, it is not still engaged at it.

Just what the annual losses amount to, taking the whole country over, it is impossible to say; but if the estimate above mentioned, in regard to one State, approached the truth, then these must amount to from ten to fifteen millions of dollars, or three-fourths as much as the losses from swine plague. I am inclined to think that this estimate is much too large, but, at the best, it is a very serious matter.

Now, why is it that this trouble has increased to this extent, when twenty-five years ago, it was almost unknown in the United States? Why do its ravages continue to be greater from year to year? And why is it extending over States once almost entirely free from it?

We know that abortion may be produced by a blow or fall, by diseases of the uterus or of its contents, by any serious disease affecting the cow, and by a number of other causes of less general interest; but these causes affect but a single individual, while practically whole dairies are affected; so that there must be something beyond these, which produces it. It is known, for instance, that a cow aborting in a stable induces the same trouble in others surrounding her—why? Abortion has been traced, says a celebrated French veterinarian, to the miasm arising in hot weather from the decomposing organic matter of half-dried marshes, and how much more should we expect such a result from the terribly fœtid odor often arising from the retained and decomposing membranes of these animals. The conclusion of the New York Commission, that the trouble was sometimes introduced into the dairies by a cow coming from a farm where it was known to exist, would, also, favor this view.

It is impossible, however, to explain a vast number of well ascertained facts by this theory; for many dairymen become so impressed with the fact of the disease being induced in this way that they remove the affected animal immediately, and long before any such decomposition could take place—and still the other cows are not spared. Were the succeeding cases, then, due to the animal first affected, or were there causes connected with the food and surroundings, acting upon all alike and causing the disorder, irrespective of the preceding case? The first fact in support of the latter supposition is, that although a single dairy may suffer to an extreme degree, this is surrounded by other perfectly healthy dairies in the same district, and this in the worst affected sections of the country. This would lead us to infer that there is a local cause. Thus, too great inclination of the floor of the stable may undoubtedly produce the disorder, and this, acting alike on all the cows in the stable, affects a certain number of the animals, and each of these being peculiarly liable to it the two succeeding years, would give us at once an enzootic outbreak of the trouble. So with improper food—that of which the animals must take into the stomach too much bulk to get the required quantity or nutritive elements; drinking very cold water immediately after coming from a warm stable; eating clover or other plants covered with frost, etc. These each act alike on all the animals on the farm, and may cause the same derangement of function in a large proportion of those exposed to them.

There are similar causes which may act on all the animals of a considerable section of the country; thus, in certain seasons the hay is of poor quality, and hence a large bulk must be eaten for support. In other seasons the grasses are covered with ergot and similar cryptogamic growth which have a decided tendency to cause abortion; at other times, rainy seasons, scarcity of food, etc., lead to debility and predispose to the affection. There is no doubt among professional men that each of these conditions may give rise to an enzootic of bovine abortion.

Still we are not satisfied to look upon such pathogenic agencies as the foundation of the trouble which of late years has caused so much complaint. These causes have always existed to the same degree as at present, and yet epizootic abortion, as it is now called, is in this country a thing of the past few years; and more, it is an affection that is gradually extending itself over sections that were previously free from it; so that, if we would recognize the trouble as it exists, we must look beyond the effects of season, of food, of water; we cannot stop with the defects of the stables, with the miasm of marshes, or with changes of temperature. There is something which renders the disease immeasurably more frequent now than formerly. What is it?

There has been but one explanation offered that seems at all consistent with the facts as they occur, and that is that most cases are the direct result of a pre-existing case of the same trouble. Are we to consider then that this is a contagious disease—one depending upon a specific germ which may be transferred with the same certainty of effects as is seen in the inoculating of other contagious maladies? This is a question that has long been debated, and for the solution of which we can, even now, only bring indirect observations.

It would seem, however, that we must recognize a division line in the causes of this disease—ranging on one side all those cases depending upon food and surroundings, and on the other those resulting from a pre-existing trouble of the same nature; and that it is the increase of the latter class which has caused the chief losses of our dairy districts. At the same time there have been many cases belonging to the former class, and the failure to make the distinction has caused much of the confusion and mystery surrounding the affection

Some of the best authorities in the world are inclined to think that the disorder is a contagious one; that there is a principle, or germ, which may be transmitted from an affected to a healthy animal and produce the same specific trouble in the latter. It has been found in the dairy districts of New York that on the worst affected farms an entire change of the cattle—selling off the old stock and buying new—would free the place from the scourge; and this, with the numerous instances in which the trouble is brought on a farm by introducing a cow from an affected dairy, is convincing evidence of the existence of some such principle. I will relate a remarkable occurrence of this kind.

I have said this disorder was rare in the South; but, a few years ago, Col. Richard Peters, the veteran stock-breeder of Georgia, introduced it on his farm in that State by importing a cow from a farm in Pennsylvania where the trouble existed; and not only did his pregnant cows abort, but his young heifers became sterile. These barren heifers, with the exception of two of his choicest, were then sent to Lookout Mountain to pasture during the summer, and while there all became pregnant; but the two which remained at home continued incapable of conception.

Here there was evidently some pathogenic action beyond a sympathy between pregnant animals; there was something besides the odor of the after-birth; something that cannot be explained by a nervous irritability or by a spontaneous affection of the brain. A cause that acted both on impregnated and virgin animals; a cause from which these animals might be removed and recover their normal condition.

Franck and Roloff, in Germany, have attempted some investigations which show that smearing the vagina of a healthy animal with the discharge of a cow that has aborted, was sufficient to induce the malady; and they have examined these discharges microscopically and detected bacteria, to which they attribute the pathogenic action. They have also shown that the abortion is preceded by heat, redness and swelling of the generative organs—that is, by a congestion or incipient inflammation.

Finally, antiseptics, and particularly chlorate of potassa (half ounce daily), have proved decidedly beneficial in cases where the disease was fairly under way; and this is accepted by many as an argument in favor of the contagious character of the affection.

Miscellaneous.

WHAT OTHERS SAY.

OPIUM EATING.—We find the following in in the "Hour": "As with alcohol, pain and sorrow are often the starting points for the habitual use of opium. Its peculiar anodyne properties soothe body and mind. It is of great value as a medicine; but it becomes an irresistible tyrant when used habitually. When its effects are fully developed by long-continued indulgence, the eye becomes sunken and glassy, the skin of a brouzed or muddy hue, the speech thick, the lips fissured, the face haggard and cadaverous, and the physical faculties generally deranged. The mental and moral conditions of the patient suffer to an alarming extent. A desire for other stimulants is often excited by the use of this strange anodyne; obligations, also, are forgotten, and a disregard or truth is characteristic of the victim. In short, body and mind become stupified and poisoned. Of course, all do not use it to the same excess, and some persons are so constituted that the repetition of a first dose is prevented by the painful reaction, causing an extreme faintness and nausea, for which the first soothing influence is no compensation. But many experience scarcely any of this at first, and the delicately organized woman, whose will is weak and whose nerves are overstrung, who suffers, perhaps, from neuralgia, finding immediate relief in opium, is in great peril of becoming a victim to its influences.

There is no lack of illustrations of the effects of this drug, as treatises on the abuse of opium and the confessions of opium-eaters bear witness. In this city there are numerous instances of refined ladies who are under its control; and what is true of the higher walks of life is equally true of the lower."

"ALTHOUGH," said Gen. Le Duc, in the course of his late speech at Elmira, "I had been identified with agriculture and its pursuits for years, beyond the reception of a few packages and bundles of seeds, from time to time, from the Department at Washington, I had no knowledge of its workings. I had always supposed that there was something in the Department of Agriculture that was national in its character, and was not prepared to find that this Department was an adjunct to the government—holding no higher relations to it than a mere seed store for the benefit mainly of the members of Congress."

COFFEE IN TYPHOID FEVER.—Dr. Guillasse, of the French Navy, reports that, in the early stages of the disease, coffee is almost a specific against typhoid fever. He gives to adults two or three tablespoonsful of strong black coffee every two hours, alternating with one or two teaspoonsful of claret or Burgundy wine. The beneficial effect is immediate. A little lemonade or citrate of magnesia should be given daily, and after a while quinine.

MOLES IN GARDENS.—Touching this irrepressible topic the London Farmer remarks that it has been very generally assumed that the great increase of grubs in the parks and gardens around Berlin is in consequence of the wholesale destruction of moles that has been carried on of late years. It is said of the mole, as of the sparrow, that he eats more than his own weight of food every day, and if this were made up wholly or principally of insects and grubs inimical to the gardeners' interests, this voracious appetite would, of course, be of valuable service. To determine this point a series of experiments has recently been carried out upon moles in confinement, under the auspices of the "Garten Direktion." To one of these prisoners were given over-night a hundred and twenty large earth-worms and seventy grubs and caterpillars of different kinds. In the morning it was found that the mole had eaten nearly all the worms, but had left the rest of his provisions utterly untouched. On a second trial of the same kind all the worms were found to have been devoured, but only a very few of the grubs, which latter were probably only attacked when the supply of the former had been exhausted. Hence it would appear that the mole in freedom renders but little assistance in the extirpation of grubs, etc., so long as plenty of other food is at hand. Similar experiments were made by the chief gardener in the Royal grounds at Potsdam, and here, too, the results showed that the services of moles as grub destroyers are far outbalanced by the mischief they do in other ways. We think on the whole that the friends of the mole are increasing.

"ONE TIRED OF FARMING," says in Mark Lane Express (London): "We are hoping and praying that we may have a good summer. I fear my crops will scarcely pay for labor and manure, and nothing for rent and taxes. It is quite an exception to find a liberal landlord in this neighborhood, I have not had one penny abatement of rent, so I have nothing to be thankful for. I am glad to see many more generous.

WAR UPON INSECTS.—With the approach of spring the farmer and gardener will be compelled to renew the war with various kinds of noxious insects, and it is well to make immediate preparations for the fight, by procuring a supply of the insecticides in common use. The first that is usually needed is ordinary flowers of sulphur, to scatter about the poultry yard and house, and especially in the nests where the fowls are laying. There are very few species of parasites infesting poultry that can withstand the fumes of sulphur, and there is no danger of injuring the fowls by scattering it about in liberal quantities. The nest of every sitting hen should be well dusted with sulphur, and when this is done the hen or her chicks will seldom be troubled with any of the numerous species of poultry lice that are usually more or less abundant wherever fowls of any kind are kept.

Freshly slaked lime, well dried, is another insecticide that is very useful for destroying many of the pests that attack plants, and in most cases it may be used quite freely without danger of injuring anything but the insects. The asparagus slugs that often appear upon the young shoots in spring are readily destroyed by liberal applications of lime when the plants are wet with dew or rain. Lime is also useful in destroying and driving away various kinds of flea beetles that infest cabbage and cauliflower plants, slugs upon cherry and pear trees, cut-worms, and similar insect pests found in almost every garden and orchard.

Strong hard-wood ashes and soot are also inimical to a great many insects that infest gardens: and as they are also excellent fertilizers they may be used freely in dusting vegetables of all kinds, and especially melons and similar vines. Every farmer and gardener should keep a barrel or two of ashes in a dry place, ready for use when wanted for dusting his plants.

TOBACCO water or the fumes of burning tobacco are death to nearly all of the aphis or plant-louse tribe of insects, as well as to many larger and equally noxious kinds. White hellebore has long been considered one of the most efficacious of all poisons for the imported currant worm; but a New Jersey fruit grower of considerable experience finds strong tobacco water quite as good as the hellebore, and soon washed off by heavy rains, whereby the fruit is not rendered unfit for use, as when other and more virulent poisons are employed. To make a strong solution, put a half bushel or bushel of tobacco stems, or even the leaves, into a cask or barrel, and press down and hold in place with a stone or other weight; then pour on hot water enough to cover the tobacco and leave it for a few days to steep. After steeping, the cask may be filled up with warm or cold water, and the solution is ready for use. If a half pound or pound of crude potash is added, or a quart or two of soft soap is stirred in, the solution will be much improved, especially in its destructive properties. After using the first liquid, the barrels may be filled again with water and left to steep a few days longer than the first time, or some fresh tobacco may be added to give the solution the required strength. Tobacco water is certainly a cheap insecticide, and will frequently be found quite as efficacious as those that are more costly and troublesome to apply. The above notes on insect destroyers we find in a late number of the N. Y. Sun. Although the same story has been told over a million of times, the hints are timely and valuable.

EVERY OBSERVANT man acquainted with city life must have seen that, in general, rural youth make a fearful mistake in seeking their fortunes in cities, and, therefore, that full support should be given to every effort which has been, or will be made to advance the science and art of agriculture by means of proper schools, so that this really noble pursuit shall have for the minds of our farmers' children that first interest which their good and the good of the country demand.

"ENGLISHMEN CAN RUN ALONE." The American Stockman asks "Why should the Mark Lane Express not come boldly out and ask that a tax so heavy as to effectually prohibit all importations, be put upon American stock, dead or alive?" If the writer of this silly question is a reader of the Mark Lane Express he knows why perfectly well—he knows that the reason is because the Mark Lane Express is opposed to any other kind of protection in relation to imports than protection against disease. The Mark Lane Express leaves the nurse Protection to the babies of commerce in America and elsewhere and says that Englishmen can run alone.

WE MAY EXPECT shortly to hear, says the Mark Lane Express, that the United States Government has put a prohibitory duty on Australian meat, as it is quite clear the Australian graziers can undersell American graziers in the markets of the latter. Then why should not the American grazier—pretty little dear!—be protected as well as the manufacturing baby?

IN POINT OF FACT, writes an Englishman residing in Chicago to the London Farmer, the Englishman coming here who will *adapt himself* to the conditions of society in this country can make as good an average of profit in farming as in any other business. His principal advantage would be that his capital would allow him to own as much land as he would rent in England, and if the value of that land doubled in a generation or less, the increase would go into his pocket instead of his landlord's. The perfecting and cheapening of transportation that are going on all the time, and the introduction of machinery into agriculture to still a greater extent, have the tendency to bring down the value of English land and advance the price of Western land. It is not logical to suppose that land values will remain stationary under such altered conditions.

Everywhere.

RURAL SPECIAL REPORTS.

GA., Atlanta, Fulton Co., March 17.—Winter unusually mild hereabouts, one freeze only, on Dec. 26, but owing to the great tenderness of vegetation in this southern country, it killed everything; great quantities of cabbage plants, onions and all fall-planted vegetables were injured or killed. Grain crops, however, were but slightly damaged, and now wheat and oats are looking fine. Farmers are preparing for planting cotton extensively, and so great are the purchases of commercial fertilizers that some of the dealers have exhausted their supply. Notwithstanding the extremely mild winter, fruit trees are backward. Peaches are just in full bloom—two weeks later than usual. The outlook for fruit, therefore, is good. Labor and everything are going up:—corn, 70@75c.; oats, 55@60c.; sweet potatoes, $1; Irish do., $2.50 ₮ bbl.; labor, $12@16 ₮ month.

C. D.

ILLS., Stone Station, Lee Co., March 16.—We had a remarkably open winter, especially during the months of Jan. and Feb.—not any snow and very little cold weather, and in consequence we have have had very bad roads right along. If we had a freeze to make the roads solid, they were so rough that a person could scarcely get along, and as soon as they were worn smooth again, it would rain and make them so muddy as to be almost impassable. As a consequence, teamsters did not get their teaming done. Farmers opened the spring work more than a week ago. C. S.

INDIANA, Roanoke; Huntington Co., March 16.—We have had and are having very hard weather on wheat and clover. The latter is injured most; but both are hurt, especially on clay soils. Our very wet fall and winter have also injured low or flat wheat fields very much. Several cold days and very cold nights of late, may injure shrubs and fruits as they had began to swell their buds. The market for grain, stock and produce is good here—roads very bad. Preparations are being made for large acreage of spring crops with favorable spring we look for a profitable year. A. C. H.

IOWA., Martinsburgh, Keokuk Co., March 18.—We have had one of the finest winters I ever saw in Iowa, and I have lived here for 25 years. We have not had snow enough to track a rabbit. The fall wheat is all killed. Spring wheat sown in February has rotted. The ground is now frozen solid. This is the coldest March I ever saw. A great deal of wheat was sown in the fall, in this part of Iowa. Market quiet:—wheat, 95c.@$1; corn, 25c.; oats, 25c.; hay, $4 ₮ ton; fat cattle, $4 on foot; hogs $3.65 gross. This is a fine farming country; all kinds of grain grow to perfection here. B. F. C.

KANSAS, Iola, Allen Co., March 16.—We had beautiful weather this month until the 13th, when we had a sudden change, the thermometer on the 14th was only 3° above zero, since then it has been milder, and this morning the ground is covered with snow; the farmers have been busy getting in their spring crops.

H. M. S.

KY., Owensboro, Trimble Co, March 18.—Weather cold; am afraid we shall lose our peaches. Wheat looks well on good land. The ground keeps so wet that farmers will have to rush work when spring opens. Roads in such bad state that hauling a load is next to impossible. J. W. S.

MAINE, Bolster's Mills, Cumberland Co., March 17.—We had an unusually mild winter with but little snow. Hay is rather scarce; worth from $10 to $17 per ton; corn, 65c.; butter, 20c.; eggs, 12c. R. S. P.

MD., Royal Oak, Talbot Co., March 18.—We had a lovely winter, with very little snow. Wheat is looking remarkably well. Fruit is not at all injured as yet. S. B.

MICH., Schoolcraft, Kalamazoo Co., March 20.—Our winter was mild. The prospects of the farmers of this State are good. The abundant wheat crop of last season brought good prices. All other crops were fair with a good market for our surplus of every description at fair rates. We have every reason for congratulation. The outlook of the coming wheat crop is such that with a continued favorable season I prophesy that Michigan's yield of wheat will amount to millions of bushels over that of last year. Of course, the future of prices, with a reasonable crop in Europe, is not so flattering. I would advise farmers to go slowly; save their surplus funds and *keep out of debt.* H. C.

MO., Springfield, Greene Co., March 19.—We had the heaviest snow storm of the season on March 11th. Peach trees were just ready to bloom. Wheat looks unusually fine for this time of the year. The past has been a good winter for stock, as it was dry and warm all the time. Jerseys are doing finely. E. A. W.

N. Y., Elmira, March 22.—We have had frequent changes in the weather during the past week; several light snows fell; a little rain, and several quite hard freezes, followed usually by a clearing sky and bright, warm sunshine; or, in other words, the character of the weather has ranged all the way from a cold, raw winter's day down to a bright, pleasant day in April. Such changes are unpleasant as well as injurious to winter wheat and small fruit. On looking over our strawberry grounds to-day, I find old settings or beds that have once fruited, badly injured from these alternate changes. Our last spring settings, however, are looking fine, especially where they were well protected by a covering of straw. Raspberries also have been materially injured from the same cause. Wheat has suffered less than might be expected. Few pieces in this section will be plowed up and planted to other crops. With the exception of hay, which has fallen off a little in price, farm products remain firm at my last quotations. There has been a great falling off in the prices paid for tobacco since last fall and early winter. Several crops have been sold during the past week at prices ranging from 6½ to 9c. "through." This is about 50 per cent. less than the average price paid early in the winter. This falling off is partly due to the poor quality of the tobacco, the best crops having been picked up before, and partly to the over-production of the poorer grades of the "weed." G. A. G., JR.

N. Y., Afton, Chenango Co., March 19.—Winter unprecedentedly mild; thermometer below zero only three mornings; only ten days' good sleighing; 2½ feet of snow only, although we invariably have from six to seven feet. Hay plentiful around here at from $7 to $8 per ton; corn, 60 to 65c.; oats, 37½ to 40c.; potatoes, 25 to 30c.; apples very scarce and worth about $1 per bush. Clover seed is worth $7 to $8 per bush.; timothy from $3 50 to $4. Prices vary from one place to another, but these are about the average. Farmers are patronizing and building creameries quite extensively here; three or four are being started this spring just in this vicinity. G. E. N.

N. C., Chapel Hill, March 15.—Under lowering clouds driven by a cool east wind, and with the beautiful peach blooms in view, I give you the greetings of the spring of 1880. The winter has been remarkable for both warmth and dryness. There has been more cold than in the winter of '75, but less rain than I have known in any winter of my life. The few freezes have, probably, sufficed to destroy the germs of disease engendered by heat and moisture. If so, the mildness of the season is cause for gratitude. The earth has not been thoroughly saturated with water since last spring. The wells that failed in autumn have, many of them, been low or dry until the present month. But the rain has fallen in sufficient quantities at last. So far, March seems to be *redeeming the time.* Rain, rain, rain! Rain in mist, in sprinkle, in shower! Rain with wind, rain without wind! Rain by day, rain by night! "Water, water, everywhere!" Thank God for the early rain! The spring is about one month behind that of last year, as to vegetation. It is about equal to that of '78. The fruit trees, Peaches, Apricots, Cherries, etc., are blooming. The Apples and Pears show little change. There has been considerable complaint of the Hessian fly and some other depredator upon the wheat. An agent of the Agricultural Bureau investigated the ravages in the wheat in Mecklenburg county, and found that the little enemy is a diminutive hopper without wings—resembling the grasshopper. The freezes have done some damage. But up to the present, the prospect for wheat in North Carolina is extraordinarily good—it has, perhaps, not been better for many years. Oats, I think, are irregular, some fine, some the opposite.

There has been some change in the Experimental Station at the University. Dr. Ledoux has resigned, with a view to return to your city. The Board accepted his resignation with great reluctance. He has done faithful and successful service in his responsible position. He has now a very high reputation in North Carolina, as a Christian gentleman and accomplished scientist. He has been the farmer's—indeed, the citizen's—oracle in regard to multitudinous interests. He has consented to remain until his successor arrives. The Board has chosen, as his successor, Mr. Goessman, of Massachusetts Agricultural College—who has most flattering recommendations. The Board of Agriculture has appointed a special Agent of Immigration, who will, in a few days, start to Europe on his mission. A. W. M.

N. C., Brookston, Warren Co., March 19.—Rain, rain every day for the last 13, three days only excepted, and still it pours. The earth is completely saturated. Rather dull for those who have no plowing done. Temperature to-day 48 deg., about the average for the past two weeks. Peaches in full bloom and safe so far. Grapes pushing out. Wheat (and grass, where there is any) growing where not under water. M. B. P.

OHIO, Wellington, Lorain Co., March 18.—Little snow, but much rain during the winter. Factory-men have about half their usual supply of ice, and that of poor quality—not more than three or four inches thick. Produce of all sorts brings good prices. Cheese is worth 13c.; butter, 22c.; eggs, 10c.; wheat, $1.25; corn, 48c.; oats, 45c.; clover seed, $4.50; hay, $11; hogs, dressed, $5. A. G. F.

OHIO, Howland, Trumbull Co., March 18.—Winter mild nearly all the time; rain and mud in excess. Wheat looking well. Wheat sells for $1.35; oats, 40c.; corn, 30c.; potatoes, 40 to 50c.; eggs, 15c.; butter, 20c., and very scarce; hay, $14. H. A. L.

S. C., Aiken, March 25.—Clear skies and balmy winds. The invalids can now sun themselves from morn till eve. Average day temperature 70°. There is still danger of frosts. It is not a surprising occurrence that peach blossoms are destroyed in early April. We are planting corn. MAJOR.

TEXAS, Waco, Mc Lennan Co., March 17.—We have had a serious set-back in our vegetable gardens in the last week. On the 13th, a sharp "norther" sprang upon us after several days' rain, and for three days the ground was frozen an inch or more in depth, with sleet and rain alternately. Up to that time we had had an unusually warm and forward season for vegetables, many of them being ready for the table; but in a few short hours *all* were lost. My peas were nearly ripe, my potatoes almost ready to bloom, all kinds of vegetables in my garden rapidly approaching maturity. My cabbage, parsnips and carrots withstood the tempest, but peas, lettuce, beets, etc., lay black and stark. My tea plants set out in January, were not injured, showing they are more hardy than is generally supposed. My tomato plants froze in my hot-bed covered with canvass, but celery by their side, was not injured. Most of our farmers had finished planting corn, and much of it had been already plowed over, but it is all destroyed, and a complete replanting will be necessary. While the potatoes were frozen, we hope they may grow out again from the roots and make us a crop. Corn is selling at 65c now,—Kansas corn, shipped to this market, as there is no home-raised corn for sale. A. S. S.

TEXAS, Dayton, Liberty Co., March 15.—We have just been blessed with the best rain that we have had in twelve months. It poured down steadily for 24 hours, and our garden looks fine now. The Cow Peas and Mold's Ennobled Oats are six inches high; the Mangels also look fine; in fact, all garden stuff is doing its level best. The flower seeds are just peeping out of the ground, and the Cuthbert Raspberries are budding. We have had no winter here, except a few days about Christmas. The past has been the driest and warmest winter we have ever seen in Texas during a residence of 32 years. Long may it "wave." Farmers are away ahead this season, owing to the fine weather. Corn is six inches high in nearly every field, and several are planting cotton. Where I have been feeding the oxen with cotton seed the ground is one mass of cotton plants. Notwithstanding all this, the cattle on the prairies are dying in hundreds. Of course, you must understand they are never fed, but subsist entirely on the prairie grass. G. G.

VA., Thoroughfare, Prince William County, March 18.—Most farmers in this section are through plowing sod land for corn; blue grass has started up well; sheep are doing finely with a little corn in the mornings—a neighbor has 27 lambs from 12 ewes. This open winter has been very profitable for our shepherds. March was a splendid month up to about the 12th. Most of our farmers have been troubled with the spring fever—putting in potatoes, peas, etc. Now the earth is robed in snow, and winter has returned unexpectedly. Wheat has made a promising start. E. K.

VA., Abingdon, Washington Co., March 15.—We are having warm, rainy weather. Wheat and grass are growing well. Some stock has been wintered with scarcely any feed. Peaches are coming into bloom. The tobacco trade has been brisk this winter; good prices were realized for last year's crop. A heavy crop will be planted if it can be set this year. It is only within the last three or four years that any interest has been manifested in this industry. I expect the last year's crop will not fall far short of 500,000 pounds. W. B. K.

VA., Lovettsville, Loudoun Co., March 18.—Our winter has been mild and pleasant enough for plowing nearly all the time up to March 9. Since then we have had almost every kind of weather—snow, rain, frost, water, and mud in superabundance but very little sunshine.

J. W. C.

VT, Waterbury, Washington Co., March 17.—A very mild winter in Vermont, with much less than our usual quantity of snow. We sell produce about as follows:—Hay, $10 ₮ ton; butter, 20@25c.; oats, 45c.; eggs, 12c. ₮ doz. We pay for good family flour $8 ₮ bbl; corn, 65c. ₮ bushel; malt $1.30 ₮ cwt. Some farmers who had the courage to tap their trees made some sugar the first of the month; this week has been colder and no sap has come. The prospect is good for an extra yield of sugar this season. A. A. L.

WASHINGTON TERRITORY, Colfax, Whitman Co., March 15.—Winter has been long but not very cold. Horses and cattle have done well in this part of the Territory on the range without feed. Fruit does well here, especially small fruit. The country is settling up fast, but the Northern Pacific Railroad grant greatly retards settlement, as the road holds a strip of forty miles on each side of its proposed route. This grant having expired, and Congress not having declared it forfeited, it is now neither railroad nor Government land, which is very discouraging and unfair for the settler. Prices—Horses from $60 to $150; stock cattle, $12 per head; sheep, $2.50; wheat, 50c.; oats, 50c.; hay, $6 per ton; bacon, 15c.; butter, 25c.; eggs, 25c.; potatoes, 50c. Dry goods and groceries high. H. M.

WIS., West Salem, La Crosse Co., March 16.—We have had a great deal of cold north winds for the last two weeks. The ground was quite bare till the 13th, when we had a heavy snow. On the whole we have had a rather disagreeable winter for these parts—too much freezing and thawing. The wheat is thought to be all killed. Wheat raising has about "played out" in these parts. Those who quit several years ago and went into stock raising, are the best off to-day. Hay is abundant and sells at from $5 to $8 a ton; corn and oats are from 30@35c. a bushel; wheat, $1; potatoes, 40c.; butter, 20@25c.; beef cattle sell from $3.25@$3.60; hogs, live, $3.25. M. L. H.

WISCONSIN, La Valle, Sauk Co., March 15.—The winter has been quite mild with but little snow; it has been continually thawing and freezing; the frost has not been all out of the ground, however. There is much apprehension that the wheat is killed. Some robins and blue birds have been seen, but March has been colder than its predecessors and the ground is now covered with snow. Wheat is $1.00 to $1.12; corn, 40c; oats, 25c; butter, 20 to 22c; eggs, 11c; hay, $5 to $6; hogs, dressed, $4 to $4.50. W. S. H.

The Querist.

ANSWERS TO CORRESPONDENTS.

The "Smith Milk Stock" of Ky.

J. W. L., Smith's Grove, Ky., asks to what breed belong the cattle known thereabouts as the "Smith milk stock." They are, in color, red or yellow and white on the sides of the body; red or yellow on the legs up to the knees; they are large, heavy-set in the rear, with bulging barrels; thin in front on top of the withers; but thick in the brisket; some are duck-legged, especially in the fore-legs. They are rich milkers, but of late years they are rapidly disappearing.

ANS.—From this description it is not easy to determine whether these cattle are Ayrshires or Short-horns, as some Ayrshires are quite large. Indeed, these *might* be Guernseys. Our friend says, however, that they have been well-known in all that section for a long time, and it is not likely therefore that they can be either Ayrshires or Guerneys, as neither of these breeds has been introduced very extensively into Ky., and few, if any, were to be found there until lately, while Short-horns were pretty freely introduced many years ago. As long ago as 1785 some grade Short-horns were taken from Va. to Clark Co., Ky., by the two sons and son-in-law of Mathew Patton, of Va., and on the latter's removal to the same county in Ky. in 1790, he took with him a pure-bred Short-horn bull and cow known as the "milk breed," or Patton stock. In 1803 James Patton, with others, imported the bull Pluto, of the "milk" breed into the same county, and in 1810, Capt. W. Smith, of Fayette county, bought from Va. the bull Buzzard, belonging to the Short-horn or "milk" breed. He was extensively used through that section for many years, and his descendants must therefore be numerous. Later on, quite a large number of importations of Short-horns were made into Ky., and in the earlier days they were generally divided into two classes, known as the "milk" and "beef" stock. It is highly probable therefore that the cattle referred to are descended from some of these early Short-horn importations, although, from the description, there is in them, probably, a good deal of the blood of "native" stock, and, possibly, of some other breeds.

Soule's Wheat.

Your correspondent, A. S., in the RURAL, page 187, asks about Saul's wheat doubtless meaning Soule's Wheat. This wheat was for many years the leading white wheat grown in Western New York. It had a heavy, beardless head, yielded heavily and was a No. 1 in quality. Many of the "brag crops"—40 bushels or more per acre—were of Soule's Wheat. Its fault was found in its lateness in ripening. About 1854-5 the wheat midge attached wheat, and Soule's, being a late variety, suffered most. Hence about 1855 Mediterranean and other early red wheats began to be largely grown, although before the advent of the wheat midge

they were not so productive as the Soule's wheat had been. Some farmers continued to grow this variety until very recently, and if the Clawson had not superseded nearly every thing else the last two years, it would still be common. The midge does not injure wheat hereabouts of late years, and as Soule's wheat is vastly superior in quality to Clawson, it should be sown on rich land. It is not so hardy as Clawson, and needs better soil and treatment. W. J. F.

Monroe Co., N. Y.

Broom Corn,

W. S. T., Upper Red Hook, M. Y., asks for information about the culture of broom corn, and the preparation for market.

ANS.—Broom corn is grown precisely as common corn, up to the time of the ripening of the seed. Just before this happens, the panicle, or head, with the seed stalks which form the brush, is cut off with about a foot or 18 inches of the stem; the stalks are broken down in two rows and crossed lattice-fashion, forming a sort of table two feet from the ground. The brush is laid upon these tables as it is cut. When dry enough, it is moved to airy dry houses in which it is laid upon slatted shelves to dry thoroughly. When perfectly dry the brush is packed in bales of about 200 pounds each, the brush being packed in the center and the ends of the stalks outside, and is sent to market for sale.

How to grow Parsnips.

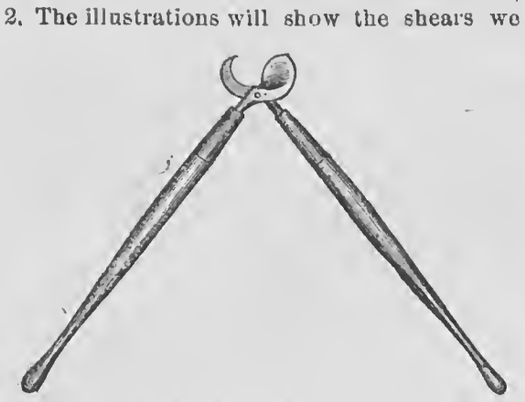
W. T. M., Lewistown, asks how to grow parsnips.

ANS.—Procure good seeds. The land must be well drained, rich and deep. Sow as early in spring as the ground can be put in perfect order. Sow thickly in rows about 15 inches apart. By "thickly" we mean at least four seeds to an inch. The seeds being slow to germinate, hoeing must commence as soon as the rows can be determined. Thin out to three or four inches apart. Treated in this way parsnips never fail, except in cases of great drought or when the land is infested with weed seeds. They may be sown as late as June—but we advise *early* sowing.

Miscellaneous.

S. B., De Wittville, N. Y., has a Honey-Locust hedge of 75 rods, two years old this spring; a year ago it was trimmed down to within six or eight inches of the ground; and he inquires how close should it be trimmed this year, and when; 2, where can he get a good pair of pruning shears; which kind are the best, and what is their price.

ANS.—1.—Cut it back to three feet now, 2. The illustrations will show the shears we



LONG-HANDLED SHEARS.—FIG. 108.

have found best in practice. The small one costs from $1.50 to $2 according to size; the large, about $3. If our friend once uses these shears, he will never again feel satis-

SMALL PRUNING SHEARS.—FIG. 109.

fied to be without them. The long-handled shears will cut a branch two inches in diameter as readily and with as little effort on the part of the pruner as is required to cut a half-inch twig with a jack-knife. Similar ones can be had of R. H. Allen, 189 Water St, N. Y., and Peter Henderson & Co., 35 Courtlandt St,, N. Y.

G. E. N., Afton, N. Y., asks, 1, how to rid cattle of lice; 2, where is a paper on live stock alone published, and its price; 3, where can he get Guénon's work on the escutcheon; 4, where can he get a good book on diseases of cattle and its price.

ANS.—1. Within the past six months several remedies have appeared in the RURAL. Washing the infested parts of the animal with strong suds of carbolic soap is as good an exterminator as any. Buy the carbolic crystals at the next drug store for about eight cents an ounce; to a pound of common bar soap, put in a pan with some water, and melted down, add one ounce of crystals, stirring well, and from the mixture make suds. Two or three applications at least of any remedy are needed, as the nits keep on hatching. Moreover, the stable surroundings of the infested animals should be well washed with the carbolic suds, as the pests often find a resting-place there and thence get on clean animals. 2. The National Live Stock Journal, an excellent monthly, price $2.15 a year, postage paid; published at Chicago, Ill. 3, Guénon on Milch Cows, 75c. 4. Law's Farmers' Veterinary Adviser, $3 is the best work on diseases of stock generally; probably the best work on diseases of cattle alone, in the language, is Clatter's Cattle Doctor, rewritten by Armitage, price $6. The three books, or either of them, can be had through the American News Co., of this city.

F. K., South Gates, N. Y., asks, 1, what is the remedy for the small white worms that pass frequently from a horse; 2, are any artificial fertilizers better for winter squashes than finely rotted barnyard manure; 3, is there any danger of killing or injuring the vines by the application of the manure; and how should it be applied.

ANS.—Horses are liable to be affected with several kinds of worms; but from the description these seem to be ascarides, commonly known as "thread worms"—white little worms about two inches long and somewhat smaller in diameter than a crow quill. To remove them:—inject every morning for a week a pint of linseed oil, containing two drachms of spirit of turpentine. Inasmuch as some may be driven up the colon, it would be well to repeat the process after an interval of a week or ten days, by which time they will have re-entered the rectum. The horse should also have a drachm of sulphate of iron (powdered) twice a day, for a week or so, with his grain. 2. Well-rotted barn-yard manure is as good as anything else, if not better. 3 No. Incorporate several shovelsful with each hill, and make the hill three to four feet wide.

F. M. B., Bucklin, Mo., asks, 1, whether there is any paper devoted exclusively to the interest of sheep husbandry; 2, would it be well to sow Bermuda grass in hollows to prevent washing; 3, where can it be obtained and at what price; 4, a description of the Star Flower.

ANS.—1. We do not know of any. 2. Yes, Bermuda grass will answer the purpose admirably. 3. Try P. J. Berckmans, Augusta, Ga. Do not know as to price. It is propagated by cuttings, and as the grass abounds in certain parts of the South, the price must be inconsiderable. A small quantity would suffice, since when once "established," you can raise it fast enough to supply your probable wants in two seasons or so. 4. Belongs to the Primrose family. Botanical name, Trientalis Americana. Leaves long-lanceolate. Slender flower stalks, bearing delicate, white, star-shaped flowers.

F. McM., Red Bank, N. J., asks what is the best remedy for the cut-worm.

ANS.—A number of remedies have been suggested, such as scattering lime, soot, etc. around the plants, but they are of little or no use. Hand-picking is the surest remedy and may be resorted to in gardens and on small cultivated patches. The worms attack the plants in May and June, and feed at night while in the day time they hide in the surface soil. They can readily be gathered, if sought early on dewy mornings. Fall plowing is also a remedy, but it should be done late in the season when those exposed are too benumbed to again crawl into the soil.

W. H. Adamsville, asks, 1, whether oat fodder is as good as hay for horses, oxen, cows young stock and sheep; 2, where can leached ashes be procured in this city; 3, where can the Lyons heel stiffeners advertised in former RURALS be obtained.

ANS.—Oat fodder cut green and when the grain is in the soft, or milk, state, is equal to the best hay for any farm animals. 2, Leached ashes can be procured of any of the dealers in fertilizers. They cost about 17 cents a bushel by the boat load. 3. The particular heel stiffener referred to or any other can be procured of any dealer in shoe findings.

A. W. A., Afton, Iowa, wants to know, 1, if it is a good thing to mix broken bones with the earth in planting Grape-vines; 2, how deep ought the holes to be dug; 3, is Maude a good Grape and is it the same as Lady?

ANS.—1. Yes, in small quantity. To be of much avail as a fertilizer, they should be pulverized. 2. About a foot and a half or two feet; grape roots seldom enter the subsoil. 3. We do not know of any Grape by the name of "Maude," and if that name is applied to Lady it is a misnomer.

J. McC., Rathbone, Wis., asks how to treat his cherry trees which bloom every year, but do not bear fruit.

ANS.—If the soil is good and the trees of vigorous growth, root-pruning will induce fruitfulness. If the trees are about six years old, sink the spade its full length in a circle about two and a-half feet from the stem. If older or younger vary the distance accordingly. Summer pinching back may have the same effect.

L. S., Chases Mills, N. Y. asks which would pay a farmer best—to collect wood ashes at 10 cents per bushel from house to house, or pay $45 a ton for superphosphates at the depot.

ANS.—That depends. How close together are the houses and how much time and labor of man and team are required to collect the ashes and put them on the farm? time is money and so is labor. Again ashes are valuable for their potash mainly; and superphosphates for their phosphoric acid—which does the land need most, or the crops grown on it?

L. A. D., Belfast, N. Y., wants a recipe for grafting wax, and asks when cions should be cut.

ANS.—Equal parts of beeswax, turpentine and resin with a little tallow, melted together and applied while fluid, make a good grafting wax. Cions should be cut in the fall, winter or early spring before the buds begin to start

H. B. P., Rawlings, N. Y., and several others, asks where that RURAL mole trap is made for sale.

ANS.—Nowhere, so far as we know. It isn't patented, and any of our friends can have it made by the next blacksmith. The cut and brief description give ample instruction how to construct it.

F. W. S., Baden Pa., asks where can he get a rectangular churn, and whether Cornish and Curtis who advertise in the RURAL, are quite reliable.

ANS.—Cornish and Curtis are thoroughly reliable; they will furnish the churn.

J. A. P., Guilford, Conn, asks, 1, where artificial comb foundation can be had and the price; 2, what is the cause of yellows in the peach and how to prevent it.

ANS.—1. J. H. Nellis, Canajoharie, N. Y., furnishes apiarian supplies. 2. Nobody knows.

W. P. D., Thurman, O., asks, 1, if Man-root can be left in the ground during the winter; 2, is Iris lævigata perenuial and will it bloom the first season.

ANS.—1. Yes. 2. Perennial; blooms second year.

Mrs. Shaw, no address, sends two plants for name.

ANS.—One is Blood-root, (Sanguinaria Canadensis), the other cannot be determined from the specimen sent.

S. C., Stone Station, Ill., asks whether drains have been successfully made by using three Tamarack poles and laying them together so that there would be a triangular space between them, instead of drain tiles.

ANS.—Yes.

We have received several inquiries as to the treatment of the seeds of our Free Seed Distribution. Full instructions on this point were given in our issue of February 28, under the head of Notes from the Rural Grounds, and, as there intimated, we cannot, in justice to the bulk of our subscribers, take up their space in repeating the matter, and must therefore refer inquirers to this late number of the RURAL.

CATALOGUES, ETC., RECEIVED.

FARMING FOR PROFIT, by John E. Read; published by J. C. McCurdy & Co., Philadelphia, Pa. This new book on practical farming is written by a man whose experience as a farmer, and whose prestige as a writer on agriculture, are in themselves a better recommendation than could be given it by any critic. It contains 860 pages and 140 engravings, is neatly printed and well bound. Within its covers is massed together more information on farm matters than can be found in any other one book. It abounds in practical common sense from beginning to end, and treats with thoroughness every subject in connection with farm management and farm life. The author has divided the work into five main divisions. Part I. deals with Agriculture and Mechanics, under which headings the whole sphere of theoretical and practical agriculture is treated, such as plant life, soil analysis, fertilizers, tillage, farm and fodder crops, draining, seed, farm implements, etc., etc. Part II. treats of Live Stock, the breeding of cattle, horses, sheep, swine and all other domestic animals, and their treatment and care in health and disease. Here is also treated the dairy interest, and the most approved methods of making butter and cheese. Part III. treats of Fruit Growing and Gardening, and Parts IV. and V. of Business Principles in Farming and Home Life. We are especially pleased to see the author give instructions for the training and care of fruit trees and the cultivation of the garden; for we are among those who believe that fruits, vegetables and flowers may not only be made remunerative to the farmer, directly or indirectly, but we believe, too, that they exert an educating influence upon the cultivator as nothing else can do, and lead him to a higher appreciation of nature, home and all that is good and pure, and hence to a happy life. The book is not sectional in its character, but treats of the cotton and sugar cane of the South as well as of the cereals of the North; it is comprehensive, practical and fully up with the times. In short, it is a book that every farmer in the land may read with profit. We do not know the price, but we refer all inquirers to the publishers.

REPORT OF MICHIGAN STATE POMOLOGICAL SOCIETY. We are indebted to Secretary Chas. W. Garfield, of Grand Rapids, Mich. for a copy of his Report for the year 1879. The Reports of this very efficient, hard-working Society are always interesting and instructive; they are permeated by the stimulating and healthful vigor that characterizes the Society, but the present Report surpasses, if possible, all preceding ones in excellence. It is an octavo volume of nearly 500 pages neatly printed and well bound. A portrait of T. T. Lyon, the honored president of the Society, forms the frontispiece, and in the middle of the work is a portrait of the veteran pomologist, Charles Downing, the same as that published in the RURAL of Aug. 16, 1879. Besides the list of officers and members, accounts, etc., of the Society, the Report contains a number of valuable essays on pomology and horticulture, that were read at the meetings of the Society. The Secretary's portfolio is interesting, as usual, and we consider the catalogue of fruits of special value. In it are briefly described 250 varieties of apples, over 60 varieties of grapes, and as many each of peaches, pears, strawberries, with other fruits in proportion. We do not know if the Reports of the Society can be bought, but will say that the cheapest way to obtain them is to join the Society. A fee of $1 entitles one to one year's membership, and a copy of the Report postpaid.

ELLWANGER AND BARRY, Rochester, N. Y. We are now in receipt of No. 2, which is a descriptive catalogue (120 p.) of ornamental trees, shrubs, hardy perennial plants, etc. of the Mount Hope Nurseries. Our readers will remember the sketch we gave in the RURAL for Sept. 21, 1878, of Viburnum plicatum, the Japan Snowball, since which we have endeavored by frequent references to make the value of this beautiful shrub apparent While it will thrive in almost any soil or situation it is one of the hardiest. It may not be wise for a journal that tries never to mislead, to be too enthusiastic over anything whatever. But we are not alone in placing this shrub as one of the most valuable in cultivation. The catalogue of which we are speaking gives a colored plate of Viburnum plicatum from which the reader may gain a tolerably correct idea of its flower and foliage.

WHEELER AND MELICK CO., Proprietors of the N. Y. Agricultural works, Albany, N. Y. This catalogue or circular is so illustrated that with the accurate descriptions given all are enabled to gain correct impressions of the construction of each machine and the manner in which connections are made. It will be sent free to all applicants. The catalogue is an interesting study for all who are alive to the value of the latest improvements in Agricultural machinery.

SKETCHES of the Physical Geography of Nebraska by Samuel Aughey, Ph. D. L. L. D., professor of Nat. Sciences in the University of Nebraska. This work of 326 pages gives a full account of the physical features of that fine State, and is a valuable book of reference to all thinking of emigrating to the West. The work can be had through Prof. Aughey at the University, Lincoln, Neb.

FOREST, FORGE AND FARM. This is the first number of a handsome illustrated trade monthly, published by E. Remington & Sons, Ilion, N. Y. It will, of course, pay special attention to fire-arms and the other lines of goods made by the firm, but promises also to embrace a large enough number of subjects to become a good family paper. Price 50cts. per annum.

BANNOCKBURN FARM, Geo. S. Wales, Rochester, N. Y. We have from this establishment a full, plain and practical treatise upon the Strawberry. Also a circular of the best of the Raspberries, Currants, Grape vines, seed potatoes, &c., &c., both of which Mr. Wales invites our readers to send for.

OUR Patent System; a lecture by Prof. R. C. Carpenter of the Agricultural College, Lansing, Mich., explaining the workings of our present patent laws, especially in connection with matters related to the farm.

ANNUAL Report of the Entomological Society of the Province of Ontario, for the year 1879. A pamphlet of 89 pages with many illustrations, a work of much interest to entomologists.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

CONDUCTED BY
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
73 Duane Street, New York.

SATURDAY, APRIL 3, 1880.

REMOVAL.

On and after May 1st of this year the Rural New-Yorker will occupy its new quarters, No. 34 Park Row, corner of Beckman Street.

NOTICE.

All applications for cuttings of Salix pentandra, which we are now sending to subscribers, must be received within ten days from this date.

Last year we experimented with all sorts of celery. It will be remembered that several catalogues made a specialty of red and golden dwarf and half-dwarf kinds. As they do not retain their color after blanching, the color may be entirely disregarded, except as it may serve to indicate quality. A variety known as Golden-heart, half dwarf, pleased us most, as being remarkably crisp, tender and sweet. For the rest, it was difficult to make any choice. Our conclusion is that excellent celery depends less upon the kind cultivated, than upon proper cultivation and blanching.

Cattle similar to Short-horns formerly existed in Mayence, France. These have been crossed now by thoroughbred Short-horns from England, and the grades cannot be told from pure-breds. The late Dr. Livingstone, when traveling some 30 years ago or more in Africa, found in one of the districts there a distinct breed of cattle closely resembling English Short-horns in size and in all their fine points. The probability is that the latter may have been derived from importations from the former, centuries ago, as the Merino sheep of Spain were said, by Columella, an ancient Roman writer on agriculture, to come from a very fine-wooled African sheep, bred in great numbers from time immemorial.

Six Thousand Million Eggs.—"Professor" Corbett of Hicksville, N. Y., is reported as asserting that this is the number of eggs annually produced in France; that 80,000,000 of these are hatched, and the chickens worth one and a half francs each (at what age he does not state) or about $20,000,000. We should like to know what authority "Prof." C. has for the above assertion, for we saw it stated in the London Agricultural Gazette, of Dec. 22, 1879, that France produced in 1878, only 3,000,000,000—just half of Prof. C's number. It also stated that the poultry was worth that same year 150,000,000 francs (say about $25,000,000.) We wish the statistics of American poultry and eggs of all kinds could be got at; but it is a very difficult thing to accomplish in so extensive a country as ours, and one so sparsely populated. We have no doubt it would be found an astonishing amount, little if at all inferior to the French production; for our farmers not only universally keep poultry of various kinds, but many village and city residents keep them also.

We are glad to hear that a distinct work on Scotch cattle has recently been issued from the Scotch press. The West Highland or Kylocs, as they are sometimes called, are generally of hardly medium size, but are so spirited in carriage and wear such lofty horns, as to give them an imposing appearance. The writer has often paused to admire them as they roamed over the high, grassy hills of Scotland, or pastured in the lowlands. They are of various colors, red, yellow, cream, dun, black and brindled. We prefer the red and yellow, as we found them the best handlers. Their beef commands from a half to one penny per pound more in the London market than any other sort. The Polled Galloway and Angus are considerably larger than the West Highlanders, and their beef is almost of as good a quality, and fetches a trifle higher price in British markets than either Short-horn, Hereford, Sussex or Devon. These are mostly of black color, with some red, dun, etc. Cows of these Scotch breeds usually give but small messes of milk; but it is very rich, scarcely inferior for making gilt-edge butter, to that of the famous Channel Island cows.

The pea weevils are becoming more and more numerous. Until of late years we have looked to Canada for our supply of seeds of the well-known varieties. But the beetle is becoming as abundant there as here, and it would seem that we must now look to England as our main reliance for sound seed. It has been suggested in these columns that if farmers and gardeners would thrust the bags of seed peas into boiling water for a moment, before opening them, these destructive insects might be greatly reduced in numbers. Otherwise the myriads of beetles to be found in seed bags escape to deposit their eggs upon the young pea-pod almost as soon as it has been formed. A single egg is deposited upon the pod over each pea. This soon hatches, the grub eating through the pod into the pod or seed, the hole closing as growth proceeds. Here the larva, or grub, remains until fall and winter during which it passes through its changes. For fastidious people, who are fond of the tender, savory green-pea, it is far from pleasant to know that on the average they eat half a dozen pea-weevil grubs with every mouthful of peas. But we know of no remedy except the impracticable one, either that all farmers unite to destroy the beetle in the way we have suggested, or that they go without green peas for several years in the hope that the weevil will starve to death or become accustomed to depositing its eggs upon some other fruit that might answer its purposes as well.

The British farmer is by no means the only grumbler at American cereal competition; the Russian peasant also is loud in his complaints of the same thing. Not only has it forced him to sell his surplus at lower figures to the rest of Europe, but it now threatens to share with him some of the home markets. Carrying coals to Newcastle could be no more exasperating to the denizens of that smoky city than carrying wheat to Odessa must be to the farmers of the vast wheat-growing tracts of the Crimea and Southern Russia. Lately, however, an American vessel is reported to have touched at Odessa with a cargo of grain for the famine-stricken people in the Caucasus. Thanks to official corruption and excessive freight charges both by rail and vessel on the Black Sea, the merchants of Tiflis find it cheaper to bring grain all the way from this country than to transport it from the neighboring Russian provinces where during last autumn thousands of tons of wheat rotted along the southern railways owing to the absence of proper granaries to protect it from the weather and the inadequacy of rolling stock to transport it to the sea. As a sample of bad management and exaction, a local paper mentions that, owing to the freight depot of the Odessa Railway being a mile and a half from the export quay, the cost of conveying the grain in wagons over the interval is heavier than that of its carriage all the way from Odessa to London.

The almost uninterrupted series of successes of the Chilians against the combined forces of Peru and Bolivia has forced the latter to abandon her ally whom she led into the unjust conflict, while at the same time the Peruvians have been defeated on every side, and have lost a large part of their territory, including the province of Tarapaca, with its vast beds of salt and nitres. The triumph of the Chilians gives them the entire control of the supply of nitrates to the world from that quarter, and it is from the extensive saltpeter deposits found in the adjacent provinces of the three Republics that the great bulk of nitrates for agricultural purposes is derived. It was the greed to obtain control of all the deposits, that about a year ago led Peru to join with Bolivia in an attack upon Chili, where extensive saltpeter beds had lately been discovered. A recent decree of the Chilian Government orders all the elaborators of nitrates who had contracts with the Peruvian Government or its agents to deliver the specified quantity to the Inspector-General of the Nitrate Establishments, for which they will receive from the Chilian Government the price stipulated in the contract. The amounts of nitrates in store and ready for shipment are to be reported to the Government in order that they may be sold to the highest bidder, for the benefit of the Chilian treasury. On the other hand, the Peruvian Government has forbidden the export of nitrates from the province it has lost, under pain of confiscation of the shipments and of all the properties of the shippers in Peru. The nitrate contractors therefore are between two fires, but as that of the Chilians is the closer, they will, no doubt, act upon the order of that Government, which places it, as regards the producers of nitrates, in the same relation as that occupied by the Peruvian Government before the Chilian occupation.

"Fun over oleomargarine" was the sub-heading in one of our evening papers here in describing the proceedings in the United States Senate on the 16th of March. Mr. Davis, of Illinois, had introduced a memorial asking Congress to pass a law to prevent the sale of grease butter as genuine butter, and the grave Senators relaxed their usual dignity to have a little fun over a matter that bears closely upon the financial interests of the vast dairy industry of the country, upon the health of its citizens and upon the morality of its trading community. Senators Conkling, Edmunds and Anthony are mentioned as the chief jokers of the occasion, and the farmers of the country would do well to remember the circumstance when these gentlemen shall solicit their suffrage on some future occasion. It has often occurred to us that if the names of those representatives of the people, State and Congressional, who find it to their taste or profit to neglect or oppose the legislation demanded by the best interests of agriculture, were more frequently placed before the farmers of the country, fear of the just indignation of these might have a salutary effect upon those whose re-election must in most cases depend greatly upon the votes of that class whose welfare they had disregarded or injured. The fun here was mainly over the selection of the Committee to which the farmers' memorial should be referred; and finally it was sent, not to the Committee on Agriculture, but to that on Manufactures.

The penalty of getting hay seed in one's hair must be serious in some parts of Australia. There are districts in that country where the sheep are much distressed and often actually destroyed by the seeds of certain grasses called "Flechilla," which, having once fallen upon or been caught by the wool, quickly work their way through the skins of the animals into their flesh. The ripe seeds of these grasses are armed with recurved barbules whose points, being sharp as needles, easily penetrate the skin, every movement of the animal tending to drive the seed deeper and deeper into the flesh. The mutton exposed for sale in the butchers' shops is sometimes so full of these grass seeds that it excites the attention of strangers. One newly arrived immigrant describes a fore-quarter of mutton as resembling a ham just taken from the bag of chaff in which it had been brought from England. On close examination it appeared that many of the seeds had still their long, thin tails drawn through the flesh, like threads interlacing each other in every direction. He goes on to say that, on questioning the butcher, he was told that they rarely killed a sheep that was not more or less punctured in this way. It stands to reason that butchers' meat, such as this, must need to be thoroughly cooked before eating. From other accounts it appears that the seeds are not infrequently found actually piercing the heart, liver and kidneys of sheep that have died from the effects of their movements. One writer says that he has found "the internal organs so crowded with the seeds that they felt like a bag of needles, if squeezed in the hand." On some "runs" where these grasses are specially abundant, the annual loss of sheep is a very serious matter. It has even been asserted that the northern part of Queensland is unfit for sheep because of the great abundance of the noxious grasses.

On March 22, the members of the Committees of Congress on Manufactures and Agriculture had a junketing trip to Baltimore, to inspect the process of manufacturing oleomargarine at the factory of the American Manufacturing Company, whose proud boast it is that it turns out from 4,000 to 6,000 pounds of the stuff every day. Everything about the factory, from the president to the refuse heap, was on dress-parade to receive the distinguished visitors and, knowing what was awaiting them after the fun of inspection was ended, all returned the civilities of their entertainers with assurances of the high gratification they felt at the sight before them. Having thus earned their dinner, they were treated to "a magnificent banquet" at Rennert's Hotel. After the cloth was removed, stimulated by the magnificent fare they had done justice to, and especially by the "salmon," several of the Congressional Solons became so many Demostheneses in the vehemence of their laudation of the product which they had been inspecting. Mr. Horr, of Michigan, was the first of the festive bauqueters to launch into praise, in which he tried to rival Mr. Carroll, one of the Directors of the Company, who had preceded him. Mr. Beale, of Va., could not praise too highly "the cow that with 100 teats distills, not milk, but butter." Mr. Aiken, of S. C., enthusiastically declared that he would never have another churn on his farm, but would buy oleomargarine. Mr. Wise, of Pa., was no longer a "doubting Thomas" about the merits of the product. Most of the other visitors, too, were equally complaisant to their hosts over the "walnuts and the wine." Of a truth, great is the power of a good dinner with an abundance of etceteras, over the average Congressman; hence it doubtless is that the most successful lobbyists have always been the best caterers. But while every corporate interest has its lobby, what chance against any of them has any conflicting agricultural interest unsupported by an influence so potent with the average legislator?

BREVITIES.

Professor Levi Stockbridge has been elected fifth President of the Massachusetts Agricultural College, in place of the Hon. Charles L. Flint who has resigned. This is the square man in the square hole.

We see advertised a variety of corn that bears kernels larger than any other variety. Very little is said as to other characteristics. Is this the "Cuzco" to which the Rural New-Yorker has of late called attention? If so, we can assure farmers that it will not ripen north of North Carolina, if, indeed, it will ripen even there.

A very good example has been set by the Paris Courts. A quack doctor who advertised very extensively a pretended cure for cancer, has been condemned to pay a fine of a 1,000 francs for practising without a diploma. If he had only known how cheaply he could have bought a splendid diploma over here, he might have saved his money.

The Congressional Committee on Printing has decided that 300,000 Reports of the Department of Agriculture for 1879 shall be printed. We trust that some effectual means may be devised by which these funds of useful and interesting information may be distributed where they will do the most good—among the farmers of the country.

For beds of colored foliage the following plants are very suitable:—Achyranthes in variety; Coleus in variety; Artemesia argentea, gymnocarpa, maritima and candidissima; Alternantheras in variety; Gnaphalium. For the middle of such beds, the following plants are as desirable as any we can call to mind:—Abutilon Darwinii or Boule de Niege; Caladium esculentum; Cannas; variegated Arundo Donax or Eulalia Japonica zebrina.

A bill is before the Mass. Legislature against tramps, punishing them with imprisonment from six months to two years. The R. I. Assembly has passed a law punishing tramps with a year's imprisonment. In the other New England States there has been severe legislation to suppress them. Southern and Western farmers, unless their States take prompt similar action, may now look for an increase among this class of summer visitors.

It now appears that the moon, which exerts so many other influences, is supposed to affect certain forms of disease. Recently a practitioner, who is a "high dilutionist," has applied to certain scientific men to aid him in reducing the "pale ray" to such a shape that it may be used for medicinal purposes. Thus far the experiment has not been a success. In New Jersey lightning has been brought into a fluid form, but bottled moonshine eludes scientific pursuit better than the mystery of the diamond does.

The youngsters who are members of Uncle Mark's Horticultural Club, have shared in our Seed Distribution, inasmuch as we have sent a package containing some flower and vegetable seeds to each. We do this to encourage them in the work, and, if possible, help to develop a taste for gardening that may prove of value to them in after years. Parents should help them in every way possible. Give a small plat of ground to each boy and girl who is willing to undertake its cultivation; furnish them with small tools and be ready with directions and counsel, and occasionally a helping hand whenever they may need such assistance.

A greatly increased demand of mutton from America, for the consumption of England, is likely to ensue this year. In consequence of the continued cold and wet weather of the past season, foot and liver rot have been very destructive of sheep there. The English papers report them as dying off by thousands, whole flocks becoming extinct. In seven of the Southern counties, where upwards of 3,000,000 sheep have been kept, it is feared scarcely one-fourth of them will be saved. In some instances, after butchering sheep which it was supposed would be passable mutton, the inner part of the carcass was found rotten and uneatable, and the only thing saved of any value was the pelt. The various breeds of Down sheep are the best for us to breed for the English market; for they are not only the most salable, but the most profitable. For some account of these, with portraits, see our issue of February 14, page 410.

Literary Miscellany.

EASTER HYMN.

Clap hands, O ye heavens,
Thou firmament ring!
From highest to lowest,
Thou universe sing!
The darkness and tumult
Have ended in calm;
And glory has come
And victory's palm.

Come forth, O ye flowers,
Come forth with the Spring!
And deck the fair plains
With each blossoming thing;
With violets meek
Let roses be joined,
And marigolds bright
With lilies combined.

Thou song of our joy
Rise higher and higher;
Thou spirit of gladness
Breathe forth from the lyre;
For Jesus is risen,
As truly he said;
Unconquered, unharmed,
He has come from the dead.

Clap hands, all ye mountains,
Ye valleys, all ring!
O warble, ye fountains;
Ye little hills, sing!
He liveth again,
As truly he said:
Unconquered, unharmed,
He has come from the dead.

—*Extant Sixteenth Century.*

A SUMMER VACATION.

(Continued from page 206.)

After this we had many delightful evenings. I felt myself under a spell which dominated all my faculties. My friend and my patients were forgotton; indeed, when in Miss Linwood's society I could remember nothing but that she was near.

When alone I did not fail to upbraid myself for my folly. I knew that I was fast falling into a state of midsummer madness, and conscious of this fact, I determined to see as little as possible of Miss Linwood during the remainder of my stay.

On the morrow I set out very early in the morning on another of my fishing expeditions. I was absent all day; indeed, it was quite dusk when, faint and weary, I reached the little gate in front of Malcombe Cottage.

Then I saw at once that something had happened—that something was amiss.

The maid-of-all-work—the only servant the modest establishment could boast—came running towards me in evident perturbation.

"Oh, sir!" she said, breathlessly, "I am so glad you have come back. I have been for Dr. Buchanan, but he is out, and no one seems to know where he is—or when he will come home!"

"The doctor! What has happened?"

"Miss Linwood, sir!"

"Miss Linwood!" I repeated, in a voice which I tried in vain to keep steady. "What of her?"

"Oh, she's dreadful ill, sir. She has not been well all day, and now she lies in a dead faint and do what we will we cannot rouse her from it! I'm afraid she's dying, sir!"

As for myself, the shock to my feelings was so great, that a minute or so elapsed before I could speak.

The appearance of my old nurse at the front door of her cottage aroused me. She was very much agitated, but her countenance brightened when she caught sight of me.

"Why, nurse!" I exclaimed, "what is all this about Miss Linwood's illness?"

"Oh! my boy, that is more than I can tell you. Thank Heaven, you have returned! Follow me at once!"

I did so, and on entering the bedroom found Miss Linwood lying quite insensible on the bed. Her face was drawn into an expression of great suffering.

I could detect a slight pulsation, and by using powerful restoratives, was at length rewarded by seeing a slight flickering of the closed eye-lids, a gasping attempt to breathe ensued, followed by a cry of the wildest anguish.

A violent hysterical attack now seized upon her. Her wild cries—her tears—her struggles were terrible to listen to and witness.

She was quite unconscious of where she was and who was standing at her side.

In all her paroxysm of grief one sentence alone escaped her lips. "Oh! Guy!" in heartrending tones. "How could you—how could you? And I trusted you so!"

Gradually, however, the violence of the attack expended itself, and in a short time she sank exhausted into a heavy slumber.

"We can do nothing, now, nurse," I said, "but wait for her wakening. But tell me what can have happened to cause this? Miss Linwood seemed well enough last night."

But Mrs. Chamberlain shook her head.

"You do not know her so well as I do. She has seemed for days to have been laboring under suppressed excitement."

"Still that would not account for this attack. She must have had a shock of some kind."

"Yes, that is it, no doubt. She received a letter this morning; I saw her turn perfectly white as soon as she commenced reading it, and when she had finished she looked so ill that I said 'Miss Linwood, you are very pale. Is there anything I can do for you?' 'Do not trouble yourself about me,' she answered, in her gentle way. 'I have just received some bad news.' She made a great effort to recover her calmness, and I fancied she had succeeded; but feeling anxious about her, I entered her room, and found her in an insensible condition, just as she was when you returned."

Leaving nurse to watch for her waking, I went down to the sitting-room, my head in a whirl A deep pang was at my heart too, which told me how dear—how very dear Miss Linwood was to me.

The attack was followed by a low, nervous fever, with which I was powerless to cope. I knew, indeed, well enough that it was only the physical manifestation of a mental grief.

I had heard frequently from my friend. Everything was going on satisfactorily—there was no necessity for my immediate return, and I felt that nothing but a case of extreme urgency could call me away from the seaside.

And how patiently she bore herself all through that tedious illness—how grateful she was for all that we had done for her—and how she reproached herself for having caused us so much trouble and anxiety!

But she made no mention of the letter which had produced such disastrous effects, nor did she make a single reference to past events.

Her countenance, however, now wore an expression of settled melancholy, which my heart ached to look upon. She never smiled, except in recognition of some service rendered.

By my advice she went out for walks and drives daily. The weather was fine and the balmy ocean breezes full of invigorating power,

In these excursions I was frequently her companion, drinking in deep draughts of joy and sadness, for much as I loved her I could detect in her demeanor no sign of a reciprocal attachment.

One afternoon we had taken a much longer walk than usual. Crossing an old stone bridge, we had made our way along the grassy slopes of a little promontory, jutting out into the sea.

We sat down on a rocky projection, partly to enjoy the scene, and partly that my companion should have a brief rest, for I feared she had overtasked her strength, and I hinted as much.

But thrilling me by one glance from her glorious eyes, she said, more cheerfully than I had heard her speak since her illness:

"Indeed, Dr. Broughton, I don't feel tired in the least, and I am sure I am quite equal to the walk back."

"Then, said I, with assumed gaiety, "I suppose I must consider I have lost my patient. I esteem myself fortunate in having been able to see you quite recovered, for I cannot prolong my stay here more than a day or so."

"I am sorry for that; I shall miss you so much."

She spoke frankly and calmly, though her regret at my departure was undoubtedly sincere. I was, however, woefully disappointed if I expected the parting would be the pang to her that I knew it must be to me.

"You are very kind to say so. I confess I would gladly stay a few days longer, but it is high time I went back to my patients. My regret is that when we part it will probably be for ever. It will be a great chance if we meet again. My visits here are annual ones, and next year——"

"Yes," she said, sighing softly, "next year! How much happens in one twelve months!"

My remark had evidently brought the past more vividly to her mind, for her smiles faded away, her eyes filled, her head bowed forward.

"Dr. Broughton," she said at length, with evident effort, "I know it must seem very strange to you that I should be living here in such seclusion and perfect isolation. You have tried, perhaps, to account for it in various ways, and yet I will venture to say that you were never once near the mark."

Her clear eyes were looking into mine, and I could only admit that she was correct in her surmise,

"But," I added, "do me the justice to believe that I have not tried to pry into your motives, nor do I wish to surprise you into an avowal of them."

"It is unnecessary for you to say so. You, however, have been so kind, so patient, and have taken so much interest in my recovery, that I feel I can indeed call you my friend; and being so, I feel also that I ought to give you a few explanations——"

"Not if they will cause you any mental uneasiness. In friendship there are two essentials—trust and confidence. In you I have the most perfect trust, and therefore there is no reason why you should give yourself pain by referring to past events."

"You surmise, then, that my story is a painful one?" she asked, after a short pause.

"I do; and I shall be greatly surprised to find that it is not."

"It is painful; and yet, do you know, this evening I feel that it would be a solace to me to relate my troubles to a sympathetic listener, such as I know you would be."

"Indeed I should!" was my earnest answer. "And if it should happen that I should be able to render you some kind of service—if——"

"No—no!" she interrupted. "My past life is over. It is dead to me. You will understand when you have heard. In the first place, my name is not Linwood."

I bowed in assent. I was quite prepared for such an announcement.

"My real name, however," she continued, "cannot be known to you, nor does it affect in any way what I have to relate. Let it suffice to say that I am an orphan, and was an heiress."

"You speak in the past tense."

"Yes, for I am an heiress no longer. At the age of twenty-one I succeeded to a large sum of money. It was left to me unreservedly by my father—that is, as soon as I attained the age mentioned I was my own mistress, and free to do as I chose—an enviable state of things, as many would think.

"I had suitors. That, as the French say, 'goes without telling!' But there was only one for whom I felt the least regard.

"This was Captain Chesney, a young man of good position and well connected.

"He proposed and I accepted him. I have told you that I had no control over my actions.

"But when the news of our engagement was made public, an old friend of my father's came to call upon me.

"'I cannot congratulate you upon your engagement,' he said, very gravely. 'I wish with all my heart you had made another choice. Excuse me for speaking thus to you, my child; I do it only out of anxiety for your welfare. All I ask is, if Captain Chesney tries to urge you into a speedy marriage, do not give your consent—say you have no desire to part with your freedom just yet—and then consider carefully before you take the irrevocable step.'

"'Do you know something to Captain Chesney's prejudice?'

"'Not more, perhaps, than I do of others. He has led a gay life, and despite a liberal allowance from his father he is heavily in debt.'

"Of that I am aware. He told me so with perfect frankness, alleging, however, that it was his misfortune, not his fault."—(To be continued.

BRINGING THEM TO THE POINT.

There is no foolishness about some of the fathers of Dubuque County, Iowa, who have marriageable daughters, and they know how to precipitate business when the fruit is ripe for plucking, and hangs, wasting its sweetness, when it should be plucked. Matters were brought to a climax with a rush at a certain farmer's residence in Vernon Township recently. A young tiller of the soil had for months been paying most assiduous attentions to one of his daughters, but he was such a bashful, modest chap, never having been much in the company of girls, except this one, that he had never been able to raise his courage sufficiently high to pop the question.

He had gone to the house in which the lady lived at least twenty different occasions, resolved to know his fate, but when ushered into the presence of the fair one in whose keeping he had placed his heart his courage would invariably "go back on him," and he would return to his lonely room in greater suspense than before. Upon the evening in question, he had determined that, come what would, he would tell his Mary that he loved her. He would once for all decide the matter, but, as upon each former occasion, he could not get the proposal further than his throat. There it stuck, and he determined to gulp it down and give up the siege, when the door opened, and in walked the girl's father, who advanced to where they were sitting, and thus addressed them—

"I came to put a stop to this here foolishness. It ain't countin' expenses that I'm lookin' at, for coal oil is cheap, an' wood can be had for the haulin', but I'm sick and tired of this billin' an' cooin' like a pair of sick doves, keepin' me awake of nights, and it's got to be stopped right here. Mary Jane look up here. Do you love John Henry well enough to marry him?"

"Why, father, I—I—you must—"

"Stop that silly foolishin," yelled the old man. "Answer yes or no, and quick too, It's got to be settled now or never."

"Well—but, father, don't you know—if you'll only wait, and—"

"Dry up; answer yes or no. Speak!" roared the old gent.

"Well, then, yes! There now," and Mary again hid her face.

"That's business; that's the way to talk. Now, John, look here—look up here, or I'll shake you all to pieces. Do you want that gal o' mine for a wife? Speak out like a man now."

"Why, Mr. ——, ain't this rather a—I mean can't you—"

"Speak it out, or out of this house you'll go, head foremost, I won't wait a minute longer. There's the gal, and there ain't a likelier gal in the State, an' you just heard her say that she wanted you. Now, John, I won't stand a bit of foolin'. Once for all, yes or no?"

"Well, yes, sir. I have been presumptuous enough to hope that I—"

"Oh, stop your soft talk; the thing's settled now. You two fools would have been six months more at that job that I've done in five minutes. I never saw such foolin' as there is among young people now-a-days. Ain't like when I was young—an' now, good-night. You can talk the thing over, an' you an' me John, 'll go up to town an' get the license to-morrow. Soon be time to get to plowin'; no time for love-makin' then. Good night, good night; I hope I wasn't too rough, but I was determined to fix the thing one way or t'other," and the old man went back to bed.

Now that the ice was broken, the young people laid all their plans for the future, and John felt just a little bad at the comfort he had lost when Mary looked up at him shyly, and said—

"This would have been all right months ago, John, if you hadn't been so skeery. I knowed all the time that you wanted to ask me; but it wasn't my place to say anything, you know."

THAT BLOCK PUZZLE.

John Henry, whose engagement to Sarah Emeline is just announced, goes up to spend the evening with his beloved, who has invited a few friends to meet him. He takes the block puzzle up with him to make it pleasant for them. He is quite dexterous in the use of the bits of wood, and has come out even several times. With great pride he showed it to Sarah Emeline and her friends. He works it out carefully. Somehow or other it bothers him more than usual this time. "I wish so many of you wouldn't stare at me," he remarked; "it makes me nervous." Then he goes into a quiet corner and works it out by himself. After a few minutes he returns, exclaiming, "Eureka!" The guests all gather around, and there, sure enough, is 13, 14, 15. "It ain't right, after all," says Sarah Emeline; "you've got 12, 11, instead of 11, 12." And so he had, and no shifting of the blocks could bring it right. Is it any wonder that John Henry put the box in his pocket and never saw his Emeline more? "For," said he, reflectively, "a girl who would take a fellow down like that before a room full of invited company has got no feelin', and it's feelin' that tells in the long run."

Mark Twain was accused of bringing a plague upon his country when he invented the horse-car poetry:

A blue trip-slip for a six-cent fare,
A pink trip-slip for an eight cent fare,

etc., is a terrible thing to get running through one's head. But that flows easily along, and while it occupies the mind it does not torture the brain. The block puzzle turns black hair gray, makes amiable men cross and sane men lunatics. It is, however, the bond of sympathy that binds the people of this city close together, and when a man is seen to stand upon the corner of a street and throw his hat in the air and shout for joy, every person who passes that way joins in the wild hallaloo, for they know he has got 13—14—15!—*Toledo Blade.*

WHERE DOES THE DAY BEGIN?

As a matter of fact, the day begins all round the world—not at the same instant of time, but just as the sun visits successive portions of the earth in his journey from east to west. But the traveler who crosses the Pacific ocean can give another answer to the above question: that on the 180th degree of longitude—one-half of the circumference of the globe, starting from Greenwich east or west—there is an arbitrary change or dropping of a day, and that at this point, if anywhere, the day may be said to begin. It was with strange feelings that the writer, crossing the Pacific, having gone to bed on Saturday night, leaving everything pertaining to the almanac in a satisfactory condition, awoke on Monday morning! Sunday had completely dropped from our calendar, for that week at least. Every one knows that in traveling round the world from east to west a day is lost, and in order to adjust his reckoning to that of the place he has left, one must drop a day as though he had not lived it, when in reality the time has passed by lengthening every day during the journey. For a long time it was the custom for sailors to affect this change pretty much where they pleased; but it has now become a settled rule among American and English navigators that at the 180th degree a day must be passed over if going west, and one added if going east, in which latter case the traveler enjoys two Sundays or two Thursdays, as the case may be. It is most likely that this particular degree was decided on from the fact that, except a few scattered islands of Polynesia, there are large communities, with their vast commercial and social transactions, to be affected by the change.—*Watertown Reformer.*

BRIC-A-BRAC.

What Did the Man Say?—A scene in court with a stupid witness. A man has been caught in the act of theft, and pleaded in extenuation that he was drunk.—Court (to the policeman who was witness): "What did the man say when you arrested him?"—Witness: "He said he was drunk."—Court: "I want his precise words just as he uttered them; he didn't use the pronoun *he*, did he? He didn't say 'he was drunk?'"—"Oh yes, he did—he said he was drunk; he acknowledged the fact."—Court (getting impatient at the witness's stupidity): "You don't understand me at all; I want the words as he uttered them; didn't he say 'I was drunk?'"—Witness (deprecatingly): "Oh, no, your honor. He didn't say you were drunk; I wouldn't allow any man to charge that upon you in my presence."—Prosecutor: "Pshawt You don't comprehend at all. His honor means, did not the prisoner say to you, 'I was drunk?'"—Witness (reflectively): "Well, he might have said you were drunk, but I didn't hear him."—Attorney for prisoner: "What the court desires is to have you state the prisoner's own words, preserving the precise form of pronoun that he made use of in reply. Was it first person I, second person *thou*, or the third person *he, she* or *it*? Now then, sir—(with severity)—upon your oath didn't my client say, 'I was drunk?'"—Witness (getting mad): "No, he didn't say you were drunk, but if he had, I reckon he wouldn't have been wrong. Do you suppose the poor fellow charged the whole court with being drunk?"

Business on the Brain.—One night last week the wife of Justice Moses was roused from a sound sleep by a stern voice.

"Are you ready for trial, I say?"

"Hush! Don't make a noise, or else you'll wake the baby," she replied, endeavoring to soothe him.

"Don't talk back to this court, he vociferated. "If you've got any witnesses, bring 'em on, but let the lawyer do the talking."

"Why, Tom, how you take on! What is the matter?"

"I'll send you up for sixty days—that's what's the matter. Enders, take her away. Now I'm ready for that petty larceny case. Bring up the prisoner."

And jumping out of bed, he started for the next room to summon a jury, but fell over a rocking chair, barked his shins, woke up, and asked his wife what the Dickens was the matter, anyhow.—*Virginia Chronicle.*

THANK GOD FOR THE FLOWERS.

Thank God for the beautiful flowers,
That blossom so sweetly and fair;
They garnish this strange life of ours
And brighten our paths everywhere.

D. S.

The clever Dr. Ritchie, of Edinburgh, met with his match while examining a student: He said: "And you attended the class for mathematics?" "Yes." "How many sides have a circle?" "Two," said the student. "What are they?" What a laugh in the class the student's answer produced when he replied "an inside and outside." But this

was nothing compared with what followed. The doctor having said to his student, "And you attend the moral philosophy class also?" "Yes." "Well, you would hear lectures on various subjects. Did you ever hear one on cause and effect?" "Yes." "Does an effect ever go before a cause?" "Yes." "Yes? Give me an instance." "A man wheeling a barrow." The doctor then sat down and proposed no more questions.

RECENT LITERATURE.

How to Learn Shorthand; the Stenographic Instructor. An Improved System of Shorthand Writing. Arranged specially for the use of those desirous of acquiring the art without the aid of a teacher; being the simplest, most practical, and the best adapted for reporting. By Arthur M. Baker. 12mo, paper, 25 cents. S. R. Wells & Co., publishers, 737 Broadway, New York.

This is the latest manual published on the subject of shorthand writing. It does not propose to teach an entirely new and untried system, but is based on the best and most successful of the older stenographic (as distinguished from the purely phonetic) system of writing. We notice, however, that there are several new features introduced, the two most important of which are a phonetic vowel scale and a method of showing the *place* of a vowel in a word, without using the phonetic vowel signs as in phonography, or breaking the outline of the word. For reporting we think it is better suited than any other system we have seen to those whose natural inclination is to write a quick, free, running hand.

We do not think we can recommend to our young readers a more useful and interesting occupation for these long winter evenings than the study of shorthand writing as taught in this little book, and the low price at which it is published places it within the reach of all.

Four Months in a Sneak-Box. By Nathaniel H. Bishop. Illustrated. Lee & Shephard, Publishers, Boston, Mass.

To anyone unacquainted with the many terms applied to crafts plying the rivers, the above publication would suggest a subject foreign to the reality. The book is a description of the experience of a cruiser in a "Sneak-Box," which is described as a vessel combining much in little; curiously constructed; possessing the qualities of comfort and service. The journey was made down the Ohio and Mississippi rivers and along the coast of the Gulf of Mexico. For interest and instruction it is deserving of much flattering comment. The maps and other illustrations serve to increase the information derived from this pleasing narrative.

MAGAZINES FOR APRIL.

Harper's Magazine.—Contents. Music and Musicians in England, Mr. John Lillie, Illustrated; Some Pennsylvania Nooks, Ella Rodman Church, Illustrated; La Villa Real de Santa Fe, Ernest Ingersoll, Illustrated; An Irish Fishing Village, J. Blackmore; Madrigals, A. Bowman Blake; Editor's Easy Chair; Editor's Historical Record; Editor's Drawer.

The First Appearance of the Yankees in Santa Fe:—The first American who seems to have penetrated to New Mexico was James Pursley—an adventurous fur trader who found his way up the Arkansas, traveled extensively through the mountains of what is now Colorado, and finally worked his way down to Santa Fe, where he went to work as a carpenter, growing rich through high wages, but suffering always a feeling of restraint. An occasional Frenchman had appeared; but Pursley (who, by the way, is credited with being the first intelligent man who discovered gold in the Rockies) was the sole citizen of the United States who was there to welcome the immortal Pike when, on that bleak March day in 1806, he unwillingly tramped into Santa Fe at the head of his Falstaffian band, hatless, bootless and trouserless through a year's campaigning on the plains and in the mountains.

The Mexicans were greatly alarmed by this sudden realization of the proximity of the progressive and well-armed Yankees, and their consternation resulted very unhappily for the few leaders of that conquering tide that finally should overwhelm the effete rule of Spain in the New World; yet for a long time after Pike's expedition nothing occurred to frighten further the proud and indolent hidalgos.—*Ernest Ingersoll, in Harper's Magazine for April.*

Phrenological Journal.—Contents: William Ellery Channing, Portrait; The New Education; Comparative Phrenology, The Ethmoid, Parietal and Frontal Bones, Illustrated; Unity of the Human Species, II; Honduras and its President, Marco Aurelio Soto, Portrait; The Miwok Indians, Illustrated; Getting Rid of Intemperance; Hector, his Work and ways; A Plucky Woman; The Young Folks on Cherry Avenue, Chap. 4, a Reading Lesson; Disease—What Is It? Food for Young and old; Hoe-handle Medicine; Another Opinion, with a Preface; A Parable; Cooking Notes; Notes in Science and Agriculture; Editorial Items; Answers to Correspondents; What They Say; Personal.

Eye-Sight.—Milton's blindness was the result of overwork and dyspepsia.

One of the most eminent American divines having for some time been compelled to forego the pleasure of reading, has spent thousands of dollars in value and lost years of his time in consequence of getting up several hours before day and studying by artificial light. His eyes never got well.

Multitudes of men or women have made their eyes weak for life by the too free use of the eyesight. In view of these things, it is well to observe the following rules in the use of the eyes:

Avoid all sudden changes between light and darkness.

Never begin to read, or write, or sew for several minutes after coming from darkness to a bright light.

Never read by twilight, or moonlight, or of a very cloudy day.

Never read or sew directly in front of the light, or window or door.

It is best to have the light fall from above, obliquely over the left shoulder.

Never sleep so that, on the first waking, the eyes shall open on the light of a window. Do not use the eye-sight by light so scant that it requires an effort to discriminate. Too much light creates a glare, and pains and confuses the sight. The moment you are sensible of an effort to distinguish that moment cease and take a walk or ride.

As the sky is blue and the earth green, it would seem that the ceiling should be of a bluish tinge, and the carpet green, and the walls of some mellow tint.

The moment you are tempted to rub the eyes that moment cease using them.

If the eyelids are glued together on waking up, do not forcibly open them, but apply the saliva with the finger—it is the speediest diluent in the world—then wash your face and eyes in warm water.—Exchange.

This has been going round for about ten years, and its ownership, we guess, is lost; but it is good enough to go on indefinitely.—Phrenological Journal for April.

The American Naturalist.—Contents: Protoplasmic Dynamics, W. S. Barnard; A Sketch of Comparative Embryology. II.—The fertilization of the Ovum.) Charles Sedgwick Minot. Progress of Inveterate Palæontology in the United States for the year 1879, C. A. White; A Review of the Modern Doctrine of Evolution [Concluded] E. D. Cope; The Tongue of the Honey Bee. A. T. Cook; Recent Literature; General Notes; Botany; Zoology; Geology and Palæontology; Geography and Travels; Microscopy; Scientific News; Proceedings of Scientific Societies; Selected Articles in Scientific Serials. The table of contents sufficiently recommends this monthly to the lover of scientific subjects.

Sabbath Reading.

SABBATH.

'Tis the pearly light of the holy dawn
That shimmers through night mists cold,
For angel fingers aside have drawn
The amber bars of the gates of gold.

And down from the hights of the upper skies
Is dropped the ladder that Jacob saw,
And men look up with their weary eyes
To the shining stair with a weary awe.

The day is a-throb with the heart of God,
With the jubilate of love o'er death;
And man alike with the lowly clod
Feels the wakening stir of his warming breath.

There's a pause in the mad world's empty mirth,
There's a Sabbath hush in the clear blue air;
Through heavenly portals there floats from earth
The fragrant incense of human prayer.

The message of mercy is borne anew
To the wayward spirit, the guilt-stained soul;
And the words of the promise fall like dew
On the heart that longs for the silent goal.

On the seething billows of human ill
Are treading the feet with glory shod
And the benison falleth, "Peace! be still!"
'Tis the gift to man of the rest of God.

—Cora S. Nourse.

PEACE.

"These things I have spoken unto you, that in me ye might have peace" (John xvi. 33).

"I know the thoughts that I think toward you, saith the Lord, thoughts of peace" (Jer. xxix. 11).

"Great peace have they which love Thy law: and nothing shall offend them" (Psa. cxix. 165).

"Be of one mind, live in peace; and the God of love and peace shall be with you" (2 Cor. xiii. 11):

"I will both lay me down in peace, and sleep; for Thou, Lord, only makest me dwell in safety" (Psa. iv. 8).

"Blessed are the peace-makers: for they shall be called the children of God" (Matt. v. 9).

"Let your requests be made known unto God. And the peace of God, which passeth all understanding, shall keep your hearts and minds" (Philip. iv. 6, 7).

An Ancient Prayer—"Keep mine eyes, lest they behold vanity: keep mine ears, lest they hear lying; but let them ever be open, to hear the word of God.

"Keep my hands, that they may do no iniquity; but may rather be raised in prayer to the Lord, in holiness and purity.

"Keep my mouth, that I may speak no folly; that I may neither detract from the absent, speak ill to those present, nor answer evil with evil; on the contrary, may I bless Thee, O Lord, at all times; let Thy praise be ever in my mouth."—S. Jerome.

Sweet Words.—Five of the sweetest words in the English language begin with H, which is only a breath: Heart, Hope, Home, Happiness and Heaven. Heart is a home-place, and home is a heart-place; and that man sadly mistaketh who would exchange the happiness of home for anything less than heaven.

Let us, for our consolation, our hope, our encouragement, our strength, in every night season, remember the name of the Lord; and let this be also the motive to constrain us through love to new obedience; for the Psalmist not only remembered the Lord's name, but was able to add "I have kept Thy law."

Knowledge of God.—Is there not such a thing as intelligent ignorance? I think so, and our knowledge of God is such an intelligent ignorance. The instructed man's knowledge of God is distinguished from the ignorant man's in being only a more intelligent ignorance. But that is something.

Keep firm hold of your Father's knowledge; strenuously seek the kingdom. In quietness, accept the methods of his unchanging providence. Thus shall your hearts be kept in peace amidst the storm of fire, with the happy thought, "So He bringeth them unto their desired haven."

Christianity is, in society, like that agency in the physical world which drives suns and systems on their tremendous tracks, yet binds them in glittering harmony, holds them to a central order, fills them with joyful life, and illuminates them with universal beauty.

With the dawning of Easter let us resolve to follow the example of the One whose glorious ascension is celebrated.

More harm is wrought by want of thought than want of heart.—Dr. E. H. Chapin.

What more fitting emblem of Christ's purity than the beautiful flowers.

He that has learned to pray as he ought, has got the secret of a holy life.

For Women.

CONDUCTED BY MISS RAY CLARK.

MAKE YOUR OWN PIES.

How well we remember, the fair days of yore,
The old farm-house kitchen, the bright painted floor,
Those days of our childhood, where mother's dear face
Illumined each corner about the old place.

Those pies of our boyhood! we've not seen them since,
The custard and pumpkin, the apple and mince,
So juicy and deep, and so mammoth in size;
But then our dear mother, she made her own pies.

Then pretty, fair housewife, with home bright and neat,
Your kitchen so tidy, your household complete,
What happiness beams in your fair sunny face;
With snowy white apron that adds such a grace,
You make your own bread, that is spongy and white,
You "put up" preserves, and make cake dark and light,
Would you fashion a dainty your household would prize?
Then pretty, fair housewife, pray make your own pies

And dear little maiden, expecting to wed,
Now don't pass this by with a toss of your head:
If your husband you'd please, all the days of your life,
And make him the sweetest and best little wife,
Pray, would you be healthy and would you be wise,
Why, dear little maiden, then make your own pies.

Maud Miller.

TO SCHOOL TEACHERS.

Teachers of common schools often are at their wits ends to keep their pupils interested in their various branches of study. In my experience I have found no difficulty for the first half of the term, but after that it is a hard matter, and the only real successful method I can recommend by actual trial, is giving small prizes. If you are recovering a reasonable renumeration for your services, you will not object to expending two or three dollars in this way. Announce to your pupils your intention of rewarding those who prove themselves most diligent, those having the greatest number of perfect recitations, by giving them a small reward of merit. This year I have given my school notice of the prizes they may expect.

I have some scholars who are almost men and women, and to this class I give a gold dollar to the most diligent pupil. I made this announcement only last week, and I already see a marked change in the recitations. This interest will continue to increase until the whole school will be under the impression that perhaps this may be the last chance they will ever get to compete for a prize and consequently, there will be more improvement in my school during the last four weeks of the term, than in any previous six.

Teachers, you in the meantime must not forget that there is a great responsibility resting on you, (I mean the class of teachers who are employed in the rural districts.) Farmers give their children into your charge and the future career of the child is very often formed by the impressions received in the first few years of school life. Therefore, be very careful and get the child started in the right course, after which it will take care of itself.

Teacher.

MRS. HAYES IN THE WHITE HOUSE.

It is safe to say that no lady in the present generation has produced a more valuable impression by the grace and simplicity of her manners in presiding at the White House than she. It is worth a journey to Washington to see so simple and unconventional a lady at the very head of the best American society. Her portraits do her scant justice. Her face is wonderfully mobile; it constantly expresses her own genuine enjoyment in the enjoyment of her guests. Her laugh is contagious; and it would be as impossible for a photograph or even a portrait to picture the life that sparkles in her face as for a picture to portray the sunshine that dances on the dimpled surface of a lake which ever and anon breaks out into a quiet rippled laughter.

Her social victory is complete, and has been won after a hard battle. The story has been told before, but it is worth retelling. She came to Washington determined not to offer wine to her guests; this was the determination of a lifetime, and she would not and could not abandon it. To give a state dinner without wine was declared to be impossible; all Washington society was opposed to her; I believe it even became a Cabinet question. For a year she was a target for the sort of arrows which it is so hard for any woman to bear unflinchingly. But she bore it all; by her patient persistence and her tact she carried the day and conquered Mrs. Grundy in her own field. She never has offered wine; Washington follows her lead; and I doubt whether any State Capital, not excluding the Capital of Maine, is a more thoroughly temperance city than Washington to-day.

ABOUT WOMEN.

The University of Brussels has for the first time admitted a lady as a science student.

Miss Bryant, daughter of the poet, and her cousin, Miss Fairchild, were at last accounts among the Americans in Rome.

Five male and two female servants will attend the ex-Empress Eugenie to Zululand.

Two young ladies have been appointed census enumerators for Ashland and Catlettsburg, Ky.

Another lady lawyer, Mrs. Laura Maxwell, has been admitted to the practice of law in Keokuk.

The widow of Dr. Cook, who lost his life in attendance upon the fever stricken people of Hickman, has just been elected State Librarian of Kentucky.

The queens of the world are in a deplorable condition. The Queens of Italy and Swoden are dangerously ill; the Empress of Russia is very low; the new Queen of Spain has fallen into epileptic fits on account of the attempt to assassinate her husband.

The Empress Elizabeth of Austria, who has a great fondness for English literature, has sent to Mrs. Isabel Burton, the wife of Captain Burton, a handsome gold locket with her monogram and an imperial crown in diamonds to mark her appreciation of that lady's book on the "Inner Life of Syria."

ADVICE TO LADIES.

In marrying, make your own match; do not marry any man to get rid of him, or to oblige him, or to save him. The man who would go to destruction without you will quite as likely go with you, and perhaps drag you along. Do not marry in haste lest you repent at leisure; do not marry for a home and a living, when by taking care of your health you can be strong enough to earn your own living. Do not let aunts, fathers, or mothers sell you for money or a position into bondage, tears, and lifelong misery, which you alone must endure. Do not place yourself habitually in the society of any suitor until you have decided the question of marriage; human wills are weak, and people often become bewildered, and do not know their error until it is too late. Get away from their influence, settle your head, and make up your mind alone. A promise may be made in a moment of sympathy, or even half delirious ecstacy, which must be redeemed through years of sorrow, toil, and pain. "Circumstances alter cases" but in the main, these suggestions hold good.

Correspondent.

THE TOBACCO QUESTION.

To anxious Marguerite in the last number of last year, I would say, that I know of only one way to secure her desired end. Create a loathing for the weed in your children and you may sleep quietly. This loathing is sure to develop if you bring your children up, as nearly as possible, on nature's original and true diet for man, raw fruit. Every morsel of meat and cupful of milk, or ounce of animal grease brings the danger home to you. They may thereby become tobacco-users or lovers of strong drink, or both. I have three boys, but am not afraid that either one will spend a cent on rum or tobacco, without a word of prohibition on my part. But, good heavens! the melons that were devoured last year during four months, would astonish you. Other fruit would also have been used if we could have secured it.

Chautauqua Co., Kansas. H. Studer.

CORRESPONDENTS' NOTES.

How shall we color the eggs for Easter?

D. F. O.

Ans.—There are several makes of dyes used for this purpose. Much labor is saved by this new mode.

Will some one reply as to the rules of a hired girl; one who is to do the work of the kitchen with the exception of fancy baking? By rules, I mean when, how and in what way they are to be performed.

A Yearly Subscriber.

Ans.—The only true solution of this problem, is to conform to the wishes of the one in charge of the household. Further comment is left to the ladies, who now have an opportunity to chronicle their opinion and experience.

Effie:—May use unbleached muslin, Swiss muslin, either plain or dotted, or linen batiste edged with lace, for curtains; for lambrequins, a new style of canton flannel is in vogue; it can be procured of different shades. Patterns for them can be obtained from any pattern dealer.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

THE KITCHEN CLUB DISCUSSES "PARTIES."

MRS. ANNIE L. JACK.

We had no cake at Mrs. Chapman's, but she treated us to scalloped oysters that are more rare than cake in this inland country place. We took home the recipe, each determined to try it in the near future. It was as follows:—One quart of oysters; a teacupful of pounded crackers; two spoonsful of butter; half a cup of milk or fresh cream; pepper and salt to taste. Butter a baking dish; put in a layer of crumbs; wet these with the cream—pepper and salt and strew in bits of butter. Put in the oysters, a spoonful at a time, with some of the liquor. Pepper them; put in bits of butter and cover with the cracker crumbs. Then more bits of butter and set in the oven with an inverted plate over it. Bake till the juice bubbles to the top; then remove the plate and brown for two or three minutes. She learned this by following the directions given in Marion Harland's "Breakfast, Luncheon and Tea."

This dish just suited the subject in discussion, which was the influence of party-giving and going among our young people. It was decided that, in moderation, such recreation was beneficial as tending to promote a friendly feeling and social intercourse. The subject of refreshments being important in a "*kitchen*" club, the views of members were asked as to this item. Miss McGreggor decided she would be content with scalloped oysters, if our hostess was the cook, with plenty of fruit afterwards—and a cup of coffee or tea. Mrs. De Macco thought young people were as contented to have trays of cake and sandwiches passed around with tea, coffee, or lemonade—anything to show hospitality before leaving. Another lady told of a friend whose husband fitted up little tables to hold six each—and at these the guests sat down and enjoyed themselves in separate groups, and, if good tact was employed in grouping, this plan was very enjoyable

Aunt Betsy gave us a humorous account of the parties in her young days. They were generally quilting bees, and the young folks were very well satisfied with a barley bannock and an apple during their evening's enjoyment. My opinion being called for, I said: "There is no doubt social gatherings of young people are beneficial, and promote good feeling in country places where the youth of isolated families can only meet in this way, except at church or market. My idea of refreshments is, that no class of society, except the very wealthy, have better opportunity for variety than farmers. Within your home you have fruit of apple, pear and grape (that is in this northern country), nuts of many kinds, popcorn, celery, and ham for your sandwiches. Your poultry yard furnishes a variety in that respect, and your preserve closet has jellies that are tempting to the appetite. So you can set a pretty table with a little outlay for confections and oranges in winter—and let your groups of bright-eyed girls and boys gather round in turn. I promise *they* will be satisfied—so may you be."

A CHAPTER IN MY EXPERIENCE.

MARGUERITE.

I STARTED out for a walk on one of these remarkably pleasant January days, for this Lake-Shore country, and I turned aside to call on the mother whose child was threatened with croup, and was not dressed wisely in my opinion. The big rocking-chair was drawn up for me and dusted with an apron; the doors to the cooking stove were pushed back so I could dry my damp feet; the boys banished from the house to secure quietness, while baby, sweet, pretty and neglected, was toddling about. The father, Mrs. O'Flany said, "was away for a few days," and she had cleaned her shanty, white-washed its walls, and was as happy as a cricket to think I had come in when I did.

"Ah, Mrs. O'Flany, your baby isn't warm enough." I said, as it climbed up on her lap, showing bare knees and thighs. "Doesn't it feel cold?"

"Yes, she always does," was the answer.

"Will you make it some drawers if I cut them for you out of half-worn cloth?"

"Indade, Mrs. Lee, and I will gladly. You are always so kind, God bless you!"

Promising to have them ready by Tuesday, I left her. It was colder on Monday; but I forgot all about my agreement until I saw two mittenless hands clasped together coming eagerly to the post-office "to hear from the father." I had become interested in my afternoon's work and for two minutes repented my promise. Just then Fred came walking in. How long would I hesitate if my child needed a a comfort? I asked myself. Ashamed of my selfish thought, I got up, opened a paper sack, took out some half-worn merino under-wear of ours, and cut out four pairs of drawers long enough to reach to the ankle; then took the wrist and ankle pieces off the original garments; cut them smaller to be sewed on the bottoms, so they would fit neatly and stay in their places inside the stockings, I cut the drawers to be open for this child, prepared bands for the waists, tied each pair separately and made a bundle of the whole to be called for.

Mrs. O'Flany did not come for the bundle; the days grew colder, so I took them over myself, determined to make a pair, partly to show her how, and partly to be sure that they really did the child some good; for the woolen stockings I sent in early winter are kept over for the next winter as she thinks "they will be big enough." I think the only thing that makes me patient with this woman and keeps me so, is her blarney; for sometimes I think I never saw a woman with so little gumption as she. I often think that she is good for blarney, but good for nothing else—but she is.

Seated in the big rocking-chair I soon had a pair fitted and made for the child to wear, and while the mother sewed buttons on its flannel chemise, for it actually wore one, on which to button them, she told me "they had gotten a letter from the father and he sent two kisses for the mother and three more, one for each one of his blessed children, and he would be home 'certain' on the morrow." When we took off the little shoe and cotton stocking it seemed to me ice could not have felt colder than the little foot, and holding it and patting it to get it warm, I told her how warm I would keep the little darling if she were mine. "If I were with you three months I would learn considerable" she said. "Let me tell you of two things—simple ones, too, I have learned of you in a week. I saw you put a skein of yarn over two chairs and then *you sat down to wind it.* Now I would have stood up, and if I had been ever so tired would not have known I could sit down and wind it too. Then again, just now when you wanted to cut a button-hole, you doubled the band and cut it with the shears. I would have had to jump up to get a razor or something else. I did not known I could use the shears for it. Some people work easily, but I do the hardest way." I left pieces for patches, and told her I would cut more when they were worn, if she let me know, and departed amid prayers for blessings on my head from the dear Lord, but it gratified me more when I thought of the child left comfortable by my efforts.

DOMESTIC RECIPES.

Parsnips.

Boil until tender, scrape, cut lengthwise, and put into a saucepan with three tablespoonsful of butter, a little pepper and salt, and a tablespoonful of chopped parsley. Shake until the mixture boils, take up the pieces carefully, and pour the butter over.

Pressed Veal.

To three pounds of veal allow one-half pound of bacon. Chop both until very fine; season with pepper and minced onion and press into a deep-baking dish and bake slowly two hours. Serve cold.

Puff Omelet.

Beat the yelks of eight eggs and the whites of four until very light, stir in a teacup of cream, in which a tablespoonful of flour has been mixed, and season with salt and pepper. Melt a tablespoonful of butter in a baking-pan, pour in the mixture and set the pan in a hot oven. When it thickens spread over the remaining whites beaten to a froth. Return to the oven and bake a delicate brown. Slip on to a large platter and serve at once.

Chocolate Cake.

Two cups of granulated sugar; one cup of butter; whites of eight eggs beaten to a froth; one cup of sweet milk, three full cups of sifted flour, and three teaspoonsful of baking powder. Beat the sugar and butter to a cream, add the milk, then the flour (baking powder in it), and the whites. When well mixed, divide and into one-half, grate a cake of sweet chocolate. Bake in layers and put together with custard as follows: Bring one pint of milk to the boiling point, stir in first two teaspoonsful of corn-starch dissolved in a little milk, and then two beaten eggs and a teacup of sugar. Flavor with vanilla. This is a very excellent cake. MARY B.

Kale.

I think if Mrs. J. M. Galpin will try the following recipes for cooking kale, she will find it palatable. No. 1. Look over carefully, tie into bunches and place for half an hour in cold water. Put into salted boiling water and cook thirty minutes. Have toasted some thin slices of bread, butter and place in a deep dish. Take up the kale, drain, remove the thread and place on the toast. Pour drawn butter over it.

No. 2. Cook the same length of time as in No. 1, drain, press, and chop fine. Put into a sauce-pan with a large lump of butter, pepper and salt to taste, and two or three tablespoonsful of vinegar. Stir until well heated, then heap upon thin slices of buttered toast.

MRS. L. JONES.

New Publications.

Novello's Music Primers.

1.	Rudiments of Music, *Cummings.*	50c.
2.	Art of Pianoforte Playing. *Pauer.*	$1.00
3.	The Organ. *Stainer.*	1.00

News of the Week

MISCELLANEOUS.

Monday, March 29, 1880.

A huge whale, measuring 65 feet in length, has been on exhibition for several days near Fulton Ferry, New York city .....Mr. Edison is constantly experimenting with the electric light. A recent thorough investigation revealed beyond a doubt that the light can be put to practical use both in light-houses, streets and other places; but it is not yet perfected, and it will require some further experiments to bring it into working order.....Atlantic steamers report heavy gales and very perilous passages .....A telegram received from the United States Attorney at Mesilla, N. M., the 26th, by the Postmaster General, states that on account of Indian depredations it is impossible to carry the mails regularly from Santa Fe to Mesilla. General Hatch has been asked for protection and has promised to supply it, but at the writing of the telegram no assistance had been received. The attorney says it will be impossible to carry the mails until some protection is given by the military.....The Florida orange crop this year is much larger than ever before. From such counties as are easily accessible the figures point to a crop of about 440,000 boxes. In Putnam county alone the 1879 yield was nearly 5,500,000 oranges, and next year, with the large number of blooming trees that will come into bearing, the crop will amount to 25,000,000 oranges..... The reduction of the debts of the United States since August, 1865, has been $761,319,350, or 27.6 per cent. In that year our public expenditures were $1,217,704,199, of which more than half was raised by taxation. In 1879 the expenditures were reduced to $266,947,883.. .....The United States circuit court at San Francisco, in the Parrot habeas corpus case, involving the validity of the law recently enacted forbidding the employment of Chinese by corporations, has decided the law unconstitutional. The case will probably be taken to the United States supreme court, Gen. Butler having announced his willingness to make a case there for the people.

AGRICULTURAL NEWS.

Last year's Russian wheat crop, though short, is reported to have been double that of this country—but, then, Russia has to feed a population of about 90,000,000. Reports have it that 55,000 people have died in Armenia from starvation—it is denied that any one has died in Ireland from that cause.. The receipts of wheat at Chicago the past year were 3,000,000 bushels greater than in any previous year. The receipts of corn were 1,250,000 bu. greater. There was a shortage of the oat crop in the State, of 8,000,000 bushels.. Florida is planting rice heavily this year.... Durham, N. C., is to have a silk factory.... Texas is said to have received $180,000,000 for her cattle in the last five years—that would be $36,000,000 a year—a trifle too much exaggeration,... Young grasshoppers have begun to appear in Hill Co., Texas .. Louisiana is about to import large numbers of Chinese laborers to replace the exodusters on the cotton and sugar plantations... Reports from all over the country show the past week to have been unusually cold and stormy for this season of the year....A cablegram from France, on the 22d, says that the unusually cold weather has severely injured the grape vines, especially in Burgundy and Champagne, so that is is feared that this year's crop, too, will be very poor....The drought in Asia Minor creates great uneasiness as to the crops, and the poor are suffering from a steady rise in the price of provisions.... Frost in Egypt—a strange visitor there—has greatly damaged the sugar fields .. Spain has lately prohibited the importation of pork from this country or Germany, through fear of trichinosis... Grain speculators in Grand Rapids, Mich., have failed for about $400,000....The first colored grange has lately been organized at Dallas, Tex., under the name of "Texas Farmers' Association"—no white "trash" admitted....The New England Milk Producers' Association have fixed the price of milk in Boston for the six months after April 1, at 33 cents per can of 8⅓ quarts, all payments to be made on or before the 15th of the month after that in which the milk was furnished....Excessive drought in Cuba... The Hon. C. L. Flint, Sec. of Mass. State Board of Agriculture, who has lately resigned the presidency of the Agricultural College at Amherst, has paid off all the indebtedness of the college, proving that it can be self-supporting.... J. W. Boynton & Co.—father, wife and son—a very extensive Chicago commission house, have failed with no assets, having fleeced a multitude of farmers who had consigned goods for sale to the rogues....In St. Louis all grades of wheat are about 22 cents per bushel higher than they were just a year ago, and corn is exactly five cents per bushel higher. Oats show an advance of six to seven cents per bushel on prices of last year at this time, and a similar advance can be shown in most of the staple products of the farm.... Prof. J. W. Comstock, entomologist of the Agr. Dep't has been examining the insects injurious to oranges in Fla., and is about to visit other orange-growing States also, including California..... Prof. Cyrus Thomas thinks that if we have a dry summer the Chinch-bug will be troublesome in the West this year..... The Iowa Legislature has abolished the State tax on dogs.....The Congressional party to inspect the Baltimore oleomargarine works was made up as follows: Committee on Manufactures—Congressman Morgan R. Wise, of Pennsylvania, Chairman; R. L. T. Beale, of Virginia; W. M. Lowe, of Alabama; John G. Hall, of New Hampshire; R. G. Horr, of Michigan, and Mr. D. B. Moon, clerk of the committee. Committee on Agriculture—Congressmen D. Wyatt Aiken, of North Carolina; J. H. McGowan, of Michigan; D. Wilbur, of New York; E. P Forsythe, of Illinois, and J. C. Ellison, clerk. There were also present from Washington, Messrs. George O. Sellhamer, attorney of the United States Dairy Company, and James McNabb, Jr; also, Mr. H. A. Proston, of Massachusetts. The visitors were received by the Directors of the oleomargarine company, as follows: President—W. Morris Orem; Secretary and Treasurer—William P. Herbert; general Manager—E. Fawcett, and Messrs. W. S. Carroll and William H. Brown, Directors.

COMMON sense and the science of chemistry when applied to butter making, reduce the time of churning one-half, increase the product 6 per cent., the quality of the product 20 per cent., and give a rich golden color to the butter the year round. All these improvements, together with many others, result from the use of Gilt-Edge Butter Maker. Sold by druggists, grocers and general storekeepers.

Burnett's Cologne is prepared from the purest and best materials, and is unrivaled in richness and delicacy of perfume.

THROAT DISEASES OFTEN COMMENCE with a Cold, Cough, or unusual exertion of the voice. These incipient symptoms are allayed by the use of "*Brown's Bronchial Troches*," which if neglected, often result in a chronic trouble of the Throat.

The Markets.

SPECIALS FROM ALL CENTERS.

Until Saturday, March 27.

HOGS, fair demand and prices higher for Yorkers; other grades dull; sales of Yorkers, good to choice at $4.60@4.65; fair light at $4.40@4.45; medium and heavy at $4.65@4.75; fair ends at $4.20@4.50; coarse rough and common at $3@4; pigs at $4.25@4.35.

Chicago.—CATTLE market active; shipping at $4@5.35; one load of Missouri steers at $5.75; butchers' steady at $2.40@4.20; stockers and feeders stronger and active at $3@4. HOGS—Market active; all sold; mixed packing $4.25@4.45; choice heavy $4.50@4.85; light $4.20@5.50. SHEEP market strong and steady; freely sold at $5.50@6.50.

ST. LOUIS.—Cattle in fair demand; good to choice native steers in light supply; butcher stock dull; choice to fancy steers at 5@$5.75; fair to good at 3.50@$4.80; light to medium, 4@$4.40; stockers and feeders at 3.25@$3.90; Texans and Indians at 2.75@$3.75. Hogs opened strong, but weakened. Yorkers and Baltimores at 4.15@$4.30; mixed packing at $4.10@4.30; butchers' to fancy at $4.40@4.60. Sheep in active demand; fair to good muttons $4.40@5.55; choice to fancy at $5.50@5.85; export sheep at $6@6.20.

EAST LIBERTY, PA.—CATTLE.—Supply light and all sold out; best at $5@5.25; fair to good at $4@4.80; common at $3.10@3.65; stockers 700 to 900 lbs at $2.25@3.75; bulls, cows and stags at $2@3.50. HOGS.—Yorkers at $4.40@4.50; Philadelphias at $4.85@5. SHEEP, selling at $4.75@6.50.

WATERTOWN, N. Y.—BEEF CATTLE.—Market firm for good lots; working oxen in moderate demand; sales of choice beef cattle at $7.25@7.75; extra at $6.75@7; first quality at $6@6.50; Second do. at $5@5.50; third do. $4@4.75. Store cattle—Working oxen, per pair, $95@170; milk cows and calves at $20@50; farrow cows at $2@25, fancy cows at $55@65; yearlings at $7@14; two years old at $12@25; three years old at $20@38. HOGS.—Western fat swine, alive $5.50. SHEEP and LAMBS—Spring lambs not in sufficient supply to make a quotation; sales of sheep in lots at $4@5.50 each; extra at $6@7; lambs at 6¾@8c. Veal calves at 4@6¾c.

Fertilizers.

Bone ash is nominally quoted at about $22 per short ton, on the basis of 70 per cent phosphate of lime. Bones quoted at $22 50@$23 for Texas and South American mixed, and $25@$26 do. for shin and shank bones. Refuse bone black at $21@$22 per short ton on merit. Sulphate of ammonia at 3½c. ₱ pound on the basis of 26 per cent. of ammonia. Dried blood at $2@$2 30 per unit of ammonia short ton. Ammonia axotine, etc., for the former at $2 62½@$2 75 per unit of ammonia, and about $2 25 do. for the latter, all short ton. Nitrate of soda, 4¼c. Saltpetre, crude 6¾@6¾. The above are wholesale prices; at retail, goods are delivered at boat or cars at the following rates: pure ground bone 47 to 50 per cent. bone phosphate and 3 to 4 per cent. ammonia, $35@$40; dissolved bone black, 15 to 17 per cent. of soluble phosphoric acid $30@$35; dissolved bone 13 to 14 per cent. of available phosphoric acid $30; ammoniated superphosphate 10 to 11 per cent of soluble phosphoric acid, 3 per cent. of potash, 3 per cent. of ammonia, $40@$45; German potash salts, 25 per cent. of sulphate of potash, $15@$18 per ton; muriate of potash, 80 percent. 2@2½c per lb. land plaster 7.50; dried blood, 10 per cent of ammonia, $35@45 per ton; fish guano dry and ground fine, 10 to 11 per cent of ammonia, 20 per cent of available bone phosphate, $40@45; fish guano, 8 per cent of ammonia, $45; unground fish guano, 6 per cent of ammonia, $25; castor pomace; $19@21; sulphate of soda ground, and in barrels, $15@18 per ton; sulphate of ammonia 4¼c. ₱ lb; bone black, 70 per cent of bone phosphate, $30@32; ground South Carolina phosphate, 57 to 60 per cent of bone phosphate, $20 per ton; No. 1 Peruvian guano, 10 per cent ammonia, standard, $55 per ton; Lobos $16 per ton; rectified $65 per ton; guaranteed $56 per ton; nitrate of soda, 5¼@5¾ ₱ lb.

FORRESTER'S potato manure, $47.50; cabbage, $50; oat, $47.50; lawn dressing, $47.50; turnip, $52; grass, $45; hop, $47.50; strawberry, $42.50; wheat, $45; rye, $47.50.

STOCKBRIDGE'S manures quoted: Potato, $50; cabbage, $50; strawberry, $40; corn $45; seeding down, $40; orange tree, $35; onion, $50—per ton each.

MAPES'S complete manures for clay soil, $25,50 per 1,000 lbs.; for light soils $25.50 per 1,000 lbs.; "A" brand for general use, $20 per 1,000 lbs.; fruit and vine, $18.50 per 1,000 lbs.; cabbage and cauliflower, $23.75 per 1,000 lbs.; corn, $24.50 per 1,000 lbs.; potato, $24 per 1,000 lbs.; asparagus, $25.50 per 1,000 lbs.; gypsum, Nova Scotia, ground, ₱ ton, $7.50.

BOWKER'S "Hill and Drill Phosphate" $15; Bowker's Phosphate $40 ₱ ton, each; Bowker's "Food for Flowers," 35c. ₱ package and $3 ₱ doz; Bowker's "animal meal for fowls," $2 50 per cwt.; Ground oyster shells, $1 ₱ cwt.

BAUGH & SONS' prices for goods delivered at depot or boat, in bags and in 2,000 lb lots: Ammoniated dissolved bones, $35; pure bone meal, from raw bones, $36; Baugh's raw bone superphosphate $40; Baugh's $25 phosphate, $25; Baugh's A. A. nitrogen, 13½ per cent. of ammonia, $48.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, March 27, 1880.

BEANS AND PEAS.—Beans are generally quiet, though marrows show rather more steadiness. A good many parcels sale only as good and such are offered freely at $1.55. White kidney scarce and firm. Other fancy beans neglected, red kidney particularly. Green peas have no wholesale inquiry; quoted at $1.75@1.80 Southern B. E. offered freely at recent lower bids, and $1.90@2 per two bushel bag, without leading to business to any extent. Marrow beans, prime, $1.55@1.60 other, $1 40@1.50; medium, prime, $1.40@1.45; other, $1.30@1.35; pea, $1.45@1.60; white kidney, $1.60@1.70; red do., $1.40@1.60; black, $1.85@1.90; the latter in light supply.

Receipts of beans for week, 4,500 bush.; exports, 2,135 pkgs. Exports since Jan. 1st, 25,900 pkgs., or double than in same period in 1879.

BEESWAX.—Demand is confined to small lots, and prices are unchanged; Western and Southern quoted at 21 to 25. Exports since Jan. 1st, 12,400 lbs.; same time '79, 11,975 do.

BROOM CORN.—The offerings have increased on the part of some of the Western holders and prices have ruled easier. Nominal quotations are for choice brush at 7½@8c.; choice hurl at 8c.; stalk bruid at 6@7c.; mixed red and green at 4@6c.

BUTTER.—The market can be dismissed this week with few remarks and few quotations. Choice fresh State and Western and the remnants of good table grades of old are firm with quick sale. Sellers do not press for upward prices, as supplies can soon enlarge and spring stock cannot be held. Under grades of butter feel the price-strength made by scanty supplies, and it is unusual to see such close ranges as now rule for extreme qualities.

New butter, creamery best, 37c.; good to prime, 35@36c.; fair to good, 33@35c.; poor to fair, 28@33c. State, pails and tubs, choice, 33c.; good to prime, 30@32c.; fair to good, 28@30c.; poor to fair, 26@28c.; Western, 29@33c. Old. State pails and tubs, fair, good to prime, 28@30c.; do. fair to good, 26@28c.; poor to fair, 24@26c.; full dairies, poor to choice, 23@30c.; bodies of dairies, 23@30c.; very poor, 20c.; Western imitation creamery 27@32c.; Western dairy, 23@28c.; poor to prime, 22@28c.; do. factory prime, 26@27c.; fair to good, 25@26c.; poor to fair, 21@23c.; very poor, 16@18c.; roll butter, 23@27c.

Receipts for week, 13,250 pkgs.; exports, 2,675 do.

CHEESE.—Supplies are working down readily and they are now quite small considering the period to clear before the new make comes to hand, consequently holders express decided confidence of current prices.

Quotations—State factory: best at 14¼@14½c.; good to prime at 13¾@14¼c.; fair to good at 13¼@13½c.; do. poor at 12@12¾c. State farm dairy: good to prime at 13¾@14c.; fair to good at 13@13¾c. Ohio factory: Cheddar, fine, 14c.; do., fair to good, 12¾@13¼c.; flat, fine, 14@14¼c.; flat, good to prime, 13@13¾c.; flat, fair to good, 12¾@13c.

Receipts for week, 5,900 boxes; exports, 6,200 do. Liverpool cable, 71s.; steam, 35s.@37s. 6d.

COTTON—Dealings have been liberal and prices closed firm at for March at .2.91@12.93c.; April, 12.94@12.95c.; May, 13.1c@13.16c.; June, 13.32@13.33c.; July, 13.44@13.45c.; August, 13.53@13.54c.; September, 13.18@13.19c.; October, 12.31@12.36c.; November, 11.99@12c.; December, 11.95@11.97c.

Quotations for spot cotton are based on American standard of classification and on cotton in store running in quality not more than half a grade above or below the grade quoted.

DRIED FRUITS.—The demand for evaporated apples has been fair. Blackberries continue scarce and high; other small fruits are unchanged. Prices are for N.C. apples, fair to good, 7½@8½c.; choice, at 9@9½c.; fancy at 10@10½c.; Virginia, at 7@8c.; New York State quarters, at 7@8c.; sliced at 7½@8¾c.; patent evaporated, choice in cases, at 14@14½c.; good and prime at 13@13½c.; evaporated, choice sliced at at 13c., and good to choice do. at 11¾@12¾c Evaporated peeled peaches, good to choice, at 22@25c.; unpeeled at 12@14c.; North Carolina peeled, fancy, at 20c.; choice do at 17@18c.; Georgia prime at 16@17c.; fair to good at 14@16c.; common at 10@12c.; unpeeled halves at 7½@8c.; do. quarters at 7@7½c. Pitted cherries at 18@19c. Blackberries nominal at 14c. bid. Raspberries at 26@27c. Plums at 17@18c.

Exports of dried apples since Jan. 4, 3,661 bbls., do. in 1879, 14,729 do.

EGGS.—Receipts for the week, 26,350 bbls.; do. last week 23,450 do. With heavy supplies the market made but little recovery from low prices for Easter business. Buyers generally waited until the close of the week and in that time the stock had become quite oppressive and sellers had to humor distribution. A very low scale of rates will be apt to rule during the next fortnight.

Near Points, ₱ doz., 12@12½c.; State and Penn. 11¾@12c. Western, fresh, 11@11½c.; Southern, 10¾@11c.; poor marks Western and Southern 9¾@10c.; duck eggs 25@26c.; goose 50@60c.

FLOUR.—Receipts have been large, freely offered and prices lower. Latest sales are within the range of $4.35@5.00 for poor to choice superfine State and Western; $5.10@5.35 for inferior to very good extra do., odd lots and lines; $5.35@5.60 for good to very choice do.; $5.00@5.35 for inferior to good shipping extra do., and $5.35@5.60 for good to very choice shipping extra do.; inferior to very good white wheat extras, $5.50@5.35, very good to very fancy do. at $6.25@7.50 red and amber winter wheat, inferior to fancy trade and family, at $5.40@7.35; round hoop Ohio, $5.25@5.65; and trade and family brands of do. at $5.75@7.50, the latter rate for very fancy; St. Louis at $5.50@6.35 for inferior to very good extras; $6.35@7.75 for very good to fancy; Minnesota clear, inferior to fancy, at $5.10@6.00; Minnesota "straights," inferior to very fancy, at $5.75@7.50, and patent inferior to fancy at $6.25@8.75; unsound stock at from $3.25@5.75; city mill extra at $6.00@6.50 for ordinary to fancy for West Indies; do. for England, $5.10@5.50 for poor to choice; do. trade and family extras, $6.40@7.25; do. for South America, $6.25@6.75; No. 2 at $3.25@4.25 for poor to very choice.

FRESH FRUITS—Fine, showy apples are scarce and in a retail way bring $3.75@4.00 per bbl.; poor to good Baldwins, and Greenings $2@3.50; Russets, $2.50@3; the latter still have the support of export trade. Greenings are scalding badly. Cranberries, about all here; crates, $3.25@3.50. Strawberries have had poor selling weather and prices are not compensating. Choice Fla., 30c.; do. Chas., 25c.; other quality, 10@20c. ₱ qt. Fla. oranges are in light supply and have advanced; choice to fancy, hf. bbl. crates $4@5; fair to good, $3@3.50. Peanuts are firm and best bags are tending higher; Va. hand-picked, 5¾@6¼c.; extra prime, 5¾@5½c.; good to prime, 4¾@5¼c.; shelled, 5¾@6c. Hickory nuts, 75c.@$1.00.

Hothouse cucumbers, choice, $3.75@4 doz.; other, $1@2.50; radishes, 100 bunches, $2.50@3; rhubarb, 100 do. $5@6; lettuce, Boston, doz. 37½@75c.; L. I. and N. J., 25@62c.; carrots, 100 bunches, $3@3.50.

Exports of apples for week, 5,425 bbls.; since Jan. 1st, 71,475; same time '79, 66,050.

GRAIN.—The large supplies that have been held at Western distributing points are being released and the extensive receipts of wheat, corn and oats have caused a sharp break in prices, leading to a fair export business. Latest sales of wheat include No. 1 white at $1.38@1.39¾; do., March, at $1.38¾@1.39¾; do., April, at $1.36¾@1.37¼; do., May, at $1.34¾@1.35; No. 2 white at $1.36¾@1.37; ungraded white at $1.36@1.56; No. 2 red at $1.42@1.44; do., March, at $1.42¾@1.43¾; do. April option, at $1.42@1.43; do., May at $1.39¾@1.40¾; ungraded red at 1.40@$1.41; mixed winter at $1.39@1.40¾; No. 3 spring at 11.34; No. 3 spring at $1.33¾@1.34; ungraded spring at $1.27½@1.29. Rye at 94c. for No. 1 Canada. Corn at for New York No. 2 at 56c.; do. old at 56½@58¾c.; New York No. 2 for March, at 55c.; do., April, at 51¾@52¾c.; do., May, at 50¾c.; New York steamer mixed at 53@55¾c.; do., March, at 55¾c. bld; ungraded mixed Western at 55@56¾c.; No. 3 at 54¾@55c. round yellow at 56c.; Southern Yellow at 56c.; yellow western at 57@57¾c.; 7,800 bush. Jersey yellow at 56c. Oats at for No. 1 white at 46¾c.; No. 2 white at 42¾@42¾c.; No. 3 white at 41¾@41¾c.; New York No. 1 at 42½c.; New York No. 2 at 42@42¾c.; do., March, at 42¾@43¾c.; do., May, at 40c.; New York No. 3 at 41c.; ungraded white Western at 43@48c.; ungraded mixed western at 41¾@42c.; white State at 44@46c.; mixed State at 41¾@42½c.; No. 2 Chicago afloat quoted at 42@42½c.

HAY AND STRAW.—Demand is very good and as the receipts are not large prices are on a firm basis. Shipping hay quoted at 70c.; retail lots at 70@80c.; for medium, and 85@90c. for prime; clover at 55@60. Straw at 95c.@$1 for long rye; 65@70c. for short rye, and 55@65c. for oat.

Exports since Jan. 1, 23,400 bales.; do. last year corresponding period, 15,650 do.

HOPS.—The export demand continues very slow and brewers are very indifferent, with prices without important change. Quotations are for

	Cents per ℔.

LIVE STOCK MARKETS

NEW YORK, Saturday, March 27, 1880.

BEEVES.—Receipts for week, 11,235 head; do. last week, 12,703 do. The week has been a good one; stiff prices have ruled even for the moderately good quality, and supplies were moved steadily; poor to fair oxen, 7@8¾c., dress 54@55 ℔s.; common to fair steers, 8¾@9¼c. dress 55@58 ℔s.; good to prime, 9¾@10¾c. dress 56@57c. Export styled cattle were not plenty enough to make a large business; but some good droves were picked out for early shipment abroad.

SHEEP AND LAMBS.—Receipts for week, 21,134 head; do. last week, 25,144 do. Good Friday made a sort of holiday, and the pens were poorly attended. Common to prime sheep sold at 6¾@7¾c.; a lot of Ohio clipped sold at 5c.; yearling lambs, 7@8¼c.; spring, per head, $3.50@5.

COWS AND CALVES.—The market has had a very slow run, with a range of $30@55 for fair to very good milkers.

VEAL CALVES.—The demand is good but low quality calves are not wanted. Live calves, N. J. and Bucks Co., choice, 7¾@8c.; prime 7¼@7½c.; State, choice, 7@7¼c.; prime, 6½@7c.; fair to good, 6@6½c. Mt. Holly, 6½@8c.; buttermilk, 3@4½c.; Grass, 2½@3c.

Hog Dressed, Jersey, choice, 10@10½c.; good to prime, 9@9¾c.; State, good to choice, 9@9¼c.; fair to good, 7½@8c.; poor to fair, 4@7c.

SWINE.—Receipts for week, 27,791 head; do. last week, 27,475 do. Receipts all used up; quotations at the close 4¾@5c.; country dressed pork light, 6¾@7¾c.; medium, 6¼@6¾c.; heavy, 6@6¼c. city dressed, 6@6¾c. Tenderloins, 10c. for choice, season growing late.

Halladay Standard.

VICTORIOUS AT

Phila., 1876—Paris, 1878

25 Years in Use.

GUARANTEED SUPERIOR

To any other Windmill Made.

17 SIZES—1 MAN TO 45 HORSE POWER

Adopted by the leading R. R. Co's and by the U. S. Govt. at Forts and Garrisons.

$3,500,000 worth now in Use.

APPARATUS AND SUPPLIES FOR

CHEESE & BUTTER

Factories, Creameries and Dairies. Complete outfits a specialty. The best boiler and engine in market. Send for circulars and net prices. JOHN S. CARTER, Successor to G. B. WEEKS, Syracuse, N. Y.

FARMERS about purchasing fertilizers and wishing to save from 100 to 2,000 per cent., can do so by sending stamp to GEORGE CASPER, M. D., Manatee, S. Fla.

STOCKBRIDGE MANURES

For 1880.

Some years ago the Stockbridge Manures were only known to a few farmers in the Connecticut Valley. Now they are so extensively used in different parts of the country as to require two large factories, one in New York and one in Boston to manufacture them. This increase shows what farmers think of good fertilizers, and is not only due to the fact that they are reliable, well-made, and high-grade manures, but also to the fact that farmers have

FOUND THEM PROFITABLE TO USE.

Now that corn, and other farm produce is bringing such good prices, we anticipate that farmers will invest still more largely in our fertilizers.

Besides the Stockbridge Manures, we manufacture several high-grade Phosphates, and deal in first-class chemicals of all kinds. Farmers who intend to use Fertilizers of any kind, should

Send for our New Pamphlet,

which contains a large amount of reliable information, beside prices for 1880.

MAILED FREE TO ANY ADDRESS.

Reading for the Young.

CLUB NOTES.

As announced in the last issue of the Rural, I have sent some seeds to each member of the Horticultural Club. In making the selection I endeavored to choose such kinds as are of easy culture, and therefore not liable to prove failures under the management of young and inexperienced gardeners. The kinds sent are, Sweet Mignonette, Double Chinese Pink, Phlox Drummondi, Portulaca, Cockscomb, Okra and "New Surprise" Musk Melon. The culture of Portulaca, Phlox Drummondi and Cockscomb has already been published in the articles on horticulture, and of course, learned by heart by all the members of the club; it will, therefore, be superfluous to say anything further about the culture of these flowers.

The Double Chinese Pink should be sown in a box or pot at the close of March or beginning of April, and the plants set out in the flower bed about the middle of May. The seed box can best be kept in a sunny window till the plants get a good start, but before they are planted out they must be hardened by removing the seed box to a sheltered position in the open air for some days. Set the plants six inches apart in the flowed-bed.

Sweet Mignonette (*Reseda odorata*) should be sown in rich ground where the plants are to remain. The plants will reach the greatest perfection if the seed is sown in rows about five inches apart. If it is sown broadcast the plants must be thinned. One can hardly conceive of anything lovelier than a few well-grown sprays of these humble but sweet-scented flowers.

Okra, or Gumbo (*Hibiscus esculentus*), is a vegetable used in the kitchen. The seed pods may be cooked in several ways. I will leave my nieces to tell us how they should be prepared for the table. The plant is tender, and the seed should not be sown till the latter part of May, north of New York. It is one of the vegetables that are but seldom seen in the farmer's garden, and I included it in this "distribution" mainly to make the young horticulturists acquainted with it. Sow in a drill two inches deep and keep the plants about a foot apart in the row. But the gem of the distribution is

THE "NEW SURPRISE" MUSK MELON.

This excellent melon is entirely new and I wish all the members to give it a good trial, by which I mean that they should give their plants their best care and attention. The fruit is of medium size with thin skin and deep salmon-colored flesh. Melons will best succeed on a light somewhat sandy but rich soil. Make the hills four feet apart each way and thoroughly mix the soil in each hill with a few shovelfuls of well-rotted manure. Plant four kernels in a hill and when the plants have six leaves remove the weakest one, so as to leave three good plants in a place. After this they must be made to grow as fast as possible and a watering of liquid manure once a week till they begin to blossom will help them along wonderfully. Cultivate till the vines cover the ground, and pinch off the ends of the most vigorous shoots to induce them to early fruiting. Should they be attacked by insects sift some ashes, plaster or lime on the leaves while the dew is on.

These few, brief, general directions I trust will be sufficient. All the members do not enjoy the same facilities for gardening, but I am sure that every bright, enthusiastic young gardener will know how to make the most of his opportunities, and devise methods and means to obtain the best results under all circumstances. Uncle Mark.

HOW JIP WENT TO CHURCH.

ALICE P. ADAMS.

Such a droll-looking little dog as Jip was, with his great black eyes and shining upturned nose! Ill-natured or disinterested people might have designated him as a *yellow* dog, but Hatty affirmed his coat to be *light buff*, and where could one find better authority than Jip's youthful mistress?

One pleasant Sunday morning the family were all ready to start on the four mile drive to church. "Hatty, where's Jip?" asked grown-up sister Sue.

"Oh, he's out on the south veranda. I guess he's asleep.

"All right, then. Get up ponies!" and Bert cracked his whip.

They were driving through the live-oak grove, about a mile from home, when Hatty exclaimed, "Oh, there's a rabbit! He's gone behind the bushes now, but you'll see him in a minute," she added, as all eyes were turned in the direction that she pointed. The rabbit soon reached open ground, and was discovered to be a small dog that seemed very familiar to the party in the wagon.

"Well, I declare, if that isn't Jip!" cried Sue. "Harriet Thorpe, I thought you said he was fast asleep on the veranda!"

"I thought he was, truly," meekly replied Hatty, though she was secretly glad he had come, and hoped that they could not send him back.

"You ought to have gone and looked," said her sister, severely.

"Never mind. I'll call him and send him home. Here Jip! Come here, sir!" but the more Bert called and whistled the faster Jip ran.

"Evidently he has made up his mind that he won't come near the wagon until we have gone so far that he can't be sent back," said Mr. Thorpe "so we shall have to take him along this time. But next Sunday, Hatty, you be sure that you know what you're talking about, for I don't want him to get in the habit of following the wagon."

The day was warm, and after a while master Jip moderated his speed, and was content to trot along slowly by the horses, when he found that he was to make one of the company.

"Poor Jippy! he looks so tired," said his sympathizing mistress. "Let's take him into the wagon, for it is a long way for such a little puppy to come."

"No, indeed! Don't you do it, Bert!" cried hard-hearted Sue. "It only serves him right for following us, and besides, if he is tired, perhaps he will stay in the wagon and go to sleep."

So, when they reached the church, a nice bed was made for Jip on the cushions, and he was left with the stern injunction to "stay there," and he "stayed—" until his friends disappeared within the church door; then down he hopped. No wagon for master Jip where there were so many strange things to be investigated!

Again and again they sent him back, but it was customary to have the door open in warm weather, so it was impossible to keep him out.

"We'll have to make the best of it. Go on, girls, he'll be all right."

So the young people walked up in front, Jip pattering after. Bert and Sue helped with the singing, and Hatty played the organ. They were rather early. "Come here Jip, you cunning, little dog," said the fair organist to her pet in a stage whisper; "hop up here on the seat and go to sleep, for you're so tired. You'll be good and go to sleep, won't you, Jippy?"

But Jip declined to make any promises. He had forgotten his fatigue and was ready for anything. So he only winked hypocritically, and rubbed his left eye.

In a few minutes a number of people entered the church, and Jip pricked up his ears, slipped from under Hatty's detaining hand, and galloped down the aisle to see what all the disturbance was about. When his curiosity was satisfied he returned leisurely to his seat. He repeated this performance *ad libitum* spite of Sue's frowns and Bert's efforts to check him. Even after the service commenced at every fresh arrival that ridiculous little yellow—I mean *buff*, Jip would hurry to the door to see who had come. At last old Mr. Sterling, who was never known to be at church in time for the second hymn, was in his pew, and Jip settled himself for a nap. But his sleep was of short duration; for as the minister became more engaged in his sermon he elevated his voice until its resonant tones penetrated Jip's slumbers, and he woke up.

The minister came forward to the front of the low platform on which was his reading-desk, and stood there, letting one foot hang partly over the edge as he went on with his discourse. Jip noticed that the minister had changed his position and went to investigate, notwithstanding Sue made a clutch at him as he hopped before her, and Bert whistled under his breath for him to come back.

Jip saw the minister's foot and thought it was extended for his benefit, but as it was held perfectly still he contented himself with sniffing at it and then looking up inquiringly into the speaker's face. If this was embarrassing to the minister he gave no outward sign, but rose higher and higher in a flight of eloquence until he reached the climax with a thundering clap!

His impassioned language excited Jip more than the other members of the congregation, and as the gestures grew frequent and forcible the dog pricked up his ears, and wagged his tail vigorously, making no effort to conceal his great interest in what the queer man was doing; and when the minister clapped his hands Jip could restrain himself no longer, but gave vent to his feelings in a sharp, quick bark!

Hatty's handkerchief was tightly pressed against her mouth, but it could not keep back an audible snicker at this exploit of her pet. Sue shook her head frowningly, and after church expressed her opinion decidedly.

"It's a perfect shame to have that miserable little yellow dog disturbing every one in the church. I hope you'll shoot him, father, if he tries to come next Sunday." (Miss Sue was very much out of sorts because some one she particularly wished to see was not at church that morning.)

"He isn't a miserable yellow"—began Hatty indignantly, but her father interrupted her saying, "Never mind now girls, we want to get home. Jip, do you want to ride too? Hop in then, for it's the last time you come up here until you learn to behave yourself." And he has never been there since.

Los Angeles Co., California.

LETTERS FROM THE COUSINS.

Dear Uncle Mark:—I am always interested in the cousins' letters, and have often thought I would write, too. If this letter finds its future abiding place in the waste basket, instead of among the cousins' letters in some future Rural, it will not be the first one that has met the same fate. We have taken the Rural ever since it has been published, and have nearly all of the papers yet—some of them are bound. Our Beauty of Hebron potatoes did not do very well but the soil, in which they were planted, was rather poor. My brother intends to give them a more favorable trial this year. Both varieties of tomatoes were splendid. Of the flower seeds we only succeeded in starting plants of the Hollyhock, Hibiscus and Bronze Ricinus. The frost came before any of the Ricinus seed matured, for which I was sorry. I must tell you about a persevering Bronze Ricinus seed. It was planted last spring in a small pot and left all summer on the flower stand on the porch. It was watered whenever it needed it, and dug up occasionally to see if it had germinated, but it hadn't. Last fall the pot was used for some little "Baby Cactus" (I do not know the scientific name) and nothing more thought of the Ricinus seed, until one day last month we noticed it had pushed the "baby" aside and sprung up in its place. It has been growing nicely ever since, and the fourth leaf is just starting out now. It has been removed to a larger pot and we hope we can raise it for our Geranium bed, where we had a regular Bronze Beauty last summer. My brother and I would like to join the Horticultural Club. If this is published I will write again. Yours truly,

Royalton, N. Y. Nell.

Dear Cousins:—How do you do? I think we are sleepy, (I write just as sleepily as I can) don't you? Looking over the letters of the cousins, written four or five years ago, I noticed that they had lively times. The boys took the girls to task for everything they wrote, and the girls retaliated. By the way, where are Dewdrop, Belle E. T., Storm and Joe Steele? Are they still cousins under another name, or have they left us? I always thought that Belle and Joe were especially spicy. Let us hear from them again. What are you going to do this summer? Garden? So am I, and in addition to that, am going to adopt a course of reading, to improve my mind. Not Mrs. Holmes's volumes either. I am interested in poultry—having hens of my own, and they pay me well. Our hens paid us last year about $40. We only had about 40 hens. I am glad Uncle Mark is going to distribute some seeds, for they are so nice. I am trying an experiment, yes, two of them, soon, and will let you know the results, if favorable.

Goodness! I must stop or this will find its way to the waste basket. Good-bye until another time.

I remain your cousin, Minnie S. White.

Erie Co., N. Y.

[Miss Minnie also sent me correct solutions of the puzzles in the Rural of March 13th. Apropos of the lively cousins who took an interest in letter writing four or five years ago. Don't grieve for them; they have probably other business to attend to. The cousins of the present day are just as clever as the old ones and can make just as lively times now as they had then if they only will try. —Uncle Mark.]

Dear Uncle Mark:—It has been some time since I have written to the Rural, but I hope you and the cousins have not all forgotten poor me. Jack Frost does not allow us to do much at gardening yet, but I have made my hot-bed, pruned my trees and such like, so that when the coming campaign opens, I shall be ready to take command. I presume my Southern cousins are far ahead of me, some have even made their gardens. I did not join soon enough to receive any of the grape seed, or at least, I did not think I had, but Uncle Mark kindly sent me a packet. I sowed it according to directions but it has not come up yet. I have a fine Concord Grapevine which did finely last year and had quite a number of fine clusters of grapes on, but I did not get the benefit of them as they were stolen. I did not have any dog to tie near it as one of the cousins did to his melon patch. But what I wish to write about is, why the cousins don't write more. I will close now as my letter is full. Your nephew, W. H. Rand.

Chittenden Co., Vt.

Dear Uncle Mark:—Father has taken the dear old Rural for a number or years and it is always a welcome visitor at our rural home. We young folks take great interest in the Horticultural Club. Sister and myself would like to be enrolled as members if you will accept us. Last year we cultivated a large variety of flowers, viz: Verbenas, Pansies, Ageratums, Dianthus Tuberoses and a host of others too numerous to mention. We received seeds from the "Free Seed Distribution" of last year. We had twenty-two pounds of the Beauty of Hebron potato from a very small potato! Some of the stalks of Blount's Prolific corn had seven ears on one stalk.

Seneca Falls, N. Y. Mignonette and Flora.

Dear Cousins:—As I cannot say much about flowers at this season, I will tell little anecdotes of what I see and hear; for you must know I am very observing. I notice a great many little things that other people don't take much notice of. Now every time I write a letter to the Rural, I will tell some little anecdote. The other day I was walking along the avenue, when my attention was attracted to a gentleman who was walking along with a large dog. The dog suddenly stood stock still before a fruit stand and would not move an inch till his master bought him a lemon. Having got his lemon he trotted off contentedly by his master's side. I heard one of the cousins say she would like to see Uncle Mark. As I am personally acquainted with Uncle Mark, and often see him, I will try to give a little description of him, Uncle Mark is tall, with light hair, and a light moustache and dark blue eyes. All our family are acquainted with him, he is often at my house. I never imagined that the Will in our story of "That Brother of Mine" would write a letter to us. I hope we will hear very often from him. I think I must close.

Your affectionate cousin Lizzie E. Blair.

New York City.

Miscellaneous.

BRIEFLETS.

Along with an increasing refinement goes a certain increasing strength, as of well-tempered steel, not to be found in coarser natures. So, too, as to character: refining processes solidify, as in the analagous instance of the conversion of brown into loaf-sugar. . . Be careful not to offend a sense of dignity. You need not be so careful about the conscience. Conscience is not so punctilious as dignity. . . Among the exhibits of the recent Applied Science Exhibition at Paris was a carpenter who, though he had artificial arms, was daily seen working at his trade; also a girl with artificial arms who sat knitting—much to the interest of spectators. . . A Milk Substitute is offered for rearing calves and pigs. Why not for babies? . . What spirited, beautiful horses implement dealers put before their mowers and reapers! And how well the drivers are dressed! They look as if they had bought a new suit, hat and all, for the occasion. Sometimes buxom young girls occupy the driver's seat. We are left to wonder why a *double seat* has never suggested itself to these wide-awake implement men! . . Commissioner Le Duc cries: "Honest Tea is the best policy!" . . A house to live in and $137 per day is the pay of the President of the United States. . . The Emperor of Russia gets $25,000 per day and Queen Victoria gets $6,000 per day. . . It is well for us that countries are not governed in accordance with the salaries paid the Chief magistrates. . . Happy are the railroads that contracted for their rails last summer. And happy the newspapers that contracted for a year's supply of paper before Jan. 1st, 1880. . . Ask any of the clerks in our fashionable drug stores if the number of opium eaters and laudanum drinkers is increasing, and he will say yes. A physician and druggist in one of our smaller cities writes: "In this town I began business twenty years since. The population, then numboring 10,000, has not increased largely, but my sales of opium have advanced from fifty pounds the first year to three hundred now; and of laudanum four times as much are required as formerly. About fifty regular purchasers come to my shop, and as many more, perhaps, are divided among the other three apothecaries in the place." In the Southern States, too, men who have become impoverished by the rebellion have taken to the use of opium to assuage their sorrows. . . Oleomargarine has only one advantage that we have ever heard of. If you don't wish to use it as butter—and the chances are pretty heavy that you don't—you have only to run a wick through it and use it for candles. It is also useful for chalking the bridge of the nose in case of local colds. Puck. . . We are in the habit of boasting of the great and increasing immigration to our shores. It would be well if we thought less about the quantity and more about the quality thereof. . . What makes Communism a real danger to-day, not only to San Francisco, but to New York and many other of our cities, is that accursed political demagogism which, to our lasting shame, is so rife among us. An immense amount of wrong is done, and the seeds of infinite mischief are sown in the name of the rights of labor. . . A new ditching machine is now exciting some interest. It is claimed that it will dig 75 to 100 rods of ditch in a day, ready for tiles, three feet in depth—one horse, a man and a boy constituting the working force. . . The Elmira Club deem beets better than turnips for cows. They do not injure the flavor of the milk. . . Mr. Snyder, of Michigan, plants Early Ohio potatoes in hills. . . Judge Balcom, as may be learned from the Husbandman's report, has raised 80 bushels of oats per acre from two bushels of seed. He thinks one and a half is enough in most cases. He has known men to sow four bushels of seed oats to the acre with a harvest of but 25 bushels. In thin seeding the crop is less liable to lodge. . . The milk substitute for calves and pigs alluded to in this column has been exposed by Mr. Voelcker as a most unsuitable substitute for milk, being composed mostly of potato starch. . . Newport is getting utilitarian as well as fashionable. Some of the leading young ladies, having attended a poultry show at Providence, purchased some thoroughbreds and so started the fashion. Now there is a genuine craze, and everybody that is anybody keeps fancy poultry. . .

Mrs. Ott.—What part of the chicken do you prefer Mrs. Jones?

Mrs. Jones.—I have no preference—only don't give me a wing.

Mr. Blair.—You don't like soaring?

Mrs. Jones.—Not on chickens' wings! . . No sane man would deny that truth and justice should take precedence of political sentiment, and that one must be a good man before he is a good Republican or Democrat. . . Any speaker or writer would be ridiculed for stating that there was a general disposition in the country to sacrifice the highest principles to party feeling; but careful observers must have seen evidence of a most dangerous tendency in this direction. . . Gratitude, which has been defined as a lively sense of future favors, has no such degrading significance to the tramp. Considering that whatever is given to him is his due, thankfulness is an unknown quantity in his equation of life. . . The tramp is chiefly interesting as a social study, by illustrating the tendency of civilization in its lower strata to relapse into barbarism. . . There is only one place at which his appearance with undeviating regularity can be counted on. This is the police station, where he stretches his weary limbs at night and sleeps with a soundness which is a refutation of the popular theory that a good conscience is essential to the enjoyment of this luxury. . . The proposition in Ohio to set apart, out of the earnings of married convicts, a certain proportion for the support of their families while in prison, looks like a move in the right direction. It is the misfortune of all human laws that punishments must fall with hardly less severity upon the innocent than the guilty. The new arrangement would qualify much that is objectionable in the system of convict labor.—The Hour.

PERSONAL ITEMS.

M. de Lesseps, doesn't speak English, though his wife and children do, quite fluently,

Dr. Glenn, who was not elected Governor of California, has enlarged his wheat area by 10,000 acres.

The election expenses of Lord Ramsay, the defeated Liberal candidate at Liverpool, were $65,000 and he has nothing whatever to show for them.

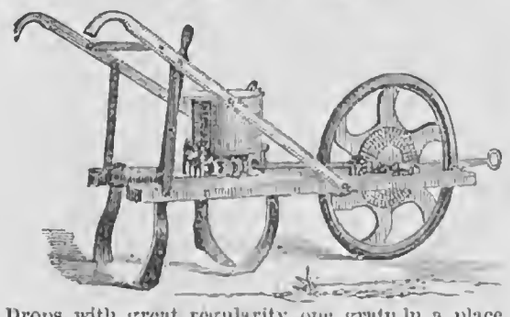
ALBION, MICH.

HOOSIER CORN DRILL!
60,000 IN USE.



Drops, with great regularity, one grain in a place, either 12, 16 or 20 inches apart, does the covering uniform in depth, and is both time and labor-saving. A given area of corn planted with this machine contains as many plants as when hilled, but their arrangement is such that *each* plant has access to the *same* amount of plant-food that must necessarily be *divided* between from 3 to 5 plants when huddled together in a *hill*. Hence a healthy start and vigorous growth of the plants and the consequent production of large, well matured ears, by which the quality is improved, and the yield increased from 10 to 20 bushels per acre, over hill planting are natural results following the use of our Corn Drill. Send for circular.

HOOSIER DRILL CO., Richmond, Ind.

THE BELCHER & TAYLOR AG'L TOOL CO.

Manufacture this Plow of the *best Car Wheel Iron*; also of *Patent Hard Metal*. The handles vibrating from one side to the other as the plow is turned at the end of the furrow, enables the plowman to walk squarely behind the plow—a feature not possessed by any other Side-Hill Plow. It does as good work as any Land-Side Plow. For further particulars and prices send for our new *Illustrated Catalogue*. Address

GEO. S. TAYLOR, Agent,
Chicopee Falls, Mass.

Implements and Machinery.

The Aquapult (in operation.)

W. & B. DOUGLAS,
Middletown, Conn., U. S. A.

BRANCH STORE AT HARTFORD, CONN.

NEW POTATO,

"ST. PATRICK."

In appearance the St. Patrick is undoubtedly one of the handsomest Potatoes ever grown; it has a smooth white skin, and white flesh, few and shallow eyes; in shape it is rather oblong than round, and has no core or hollow; it is also a strong and hardy grower, and, from all accounts, has withstood the rot so prevalent last season better than any other sort. It produces but few small tubers, ripens medium early, and, finally, it is enormously productive and of fine quality.

At the Fall Exhibition of the New York Horticultural Society, held in this city, September, 1879, the St. Patrick shown by us was awarded the First Premium over all other Seedling Potatoes exhibited.

Price 50 cts. per lb., by Mail.

Or by Express or Freight, $3.50 per peck; $8.00 per bushel; $30.00 per bbl.

We also offer selected stocks of the following leading Seeds:

		¼ lb.	1 lb.
Beet.	—Early Blood Turnip	$0.10	$0.35
"	—Dark Red Egyptian	0.20	0.75
Onion.	—Early Flat Red	0.75	2.75
"	—Wethersfield Red	0.60	2.00
"	—Yellow Danvers	1.00	3.50
"	—Yellow Dutch	0.90	3.25
Radish.	—Round Dark Red	0.25	0.75

THE ATTENTION of owners of Farm Property and Residences is invited to the above Pyramid, showing the uniform and sure growth, during the last seventeen of its 27 years of existence, of a fire insurance company whose charter limits its business to their class of property—the **Agricultural Insurance Company**, of Watertown, N. Y. The figures represent the amount set apart at the dates given for the PROTECTION OF POLICY HOLDERS.

Twenty-seven years of patient toil has made this the strongest and largest Company doing an exclusive Dwelling Business in the United States, if not in the world. It now issues 45,000 polices a year. No other like Company can show such growth and increase.

The history of this Company proves that a LARGE business, well scattered, managed with prudence, *can be done with a very small profit from each risk*, and afford perfect security, which will grow stronger every year.

While nine-tenths of the "Mutual" fire insurance companies, and many of the Stock companies, have failed on account of reckless or extravagant management, or doing too small a business, the OLD AGRICULTURAL, by economy, energy and prudence, has every year added a substantial amount to its Assets, for the indemnity of its patrons, and it now occupies a position in the confidence of the public second to no other Company.

From year to year it spreads the base of its Pyramid and gains strength.

EXTRACT FROM CHARTER.—"*Article 2.* This Company is formed for the purpose of insuring Farmers' Dwellings, Private Residences, Barns and Outbuildings, with their contents, and other property not more hazardous," and is strictly confined to this class of property.

IMPORTANCE OF DRAINAGE.

Usual Acreage and Prospects in New England.

Moderate Increase and fine Expectation in the Middle States.

LARGE INCREASE and VARIED OUTLOOK at the WEST.

Considerable Increase and Hope in the South.

Some Increase and a Fair Lookout on the Pacific Slope.

GENERAL PROSPECT.

About Last Year's Crop from an Increased Acreage.

MIDDLE STATES.

New York.

RURAL EXPERIMENTAL FARM, Queen's Co.—Twenty different kinds of wheat were put in from 15th of Sept. to Oct. 15th. All are looking well—Silver Chaff at the present time is looking the best. It stands thicker than the others on the ground; its color is a very dark green and it has made a better growth than any of the others. Wheat in this county, as far as we have observed, is looking well.

Afton, Chenango Co.—The winter has hurt the wheat crop very badly. Some fields look entirely dead—and most of them are so—while others are quite green. The winter has been very open, with little snow, so that the wheat has been greatly exposed. Its appearance is poorer than in any year since farmers began raising it, six or seven years ago. About that time a few farmers tried wheat growing as an experiment, and it succeeded so well that many others followed their example and the area has been constantly increasing. This year's acreage is from 10 to 15 per cent. larger than last year's. Taken as a whole, wheat looks rather "dubious," and the prospect is that the present year's experience will put a damper on wheat growing here in future. G. E. N.

ALBION, Orleans Co.—The wheat in this section appears to have been somewhat injured by frost. I have not discovered any signs of disease or injury by the Hessian fly. I think, in comparison with last year's, the prospects are not as favorable for a good crop, but it compares well with several years before the last. The acreage is larger. J. G.

ALDEN, Erie Co.—In this section late-sown wheat is badly winter-killed; early-sown is in fair condition. No sign of disease. I have neither seen nor heard of any ravages by the fly. At the present writing the outlook is good. Acreage, 25 per cent. above the average. J. M. C.

ALMOND, Alleghany Co.—The winter in this section has not been unfavorable to winter wheat. We see no signs as yet of disease or insects of any kind. Its general appearance is as good as, if not better than, the average. I think there is very little doubt but we shall have a good harvest of winter wheat in this section. J. M. W.

BINGHAMPTON, Broome Co.—It is too early to estimate the general condition of the wheat crop in this section. The acreage is less than usual—about four-fifths the average area. On heavy soils the crop is poor and has been disturbed by frosts. Early-sown wheat is good for the season. Late-sown was affected by drought last fall. With a favorable season henceforth the yield will be good. H. W. G.

BURDETT, Schuyler Co.—Wheat wintered well, and until now has not been damaged to any considerable extent. It looks healthy. No Hessian fly. Will compare well with crops of former years at this season. The acreage is about the same as usual. From now on the alternate freezing and thawing have hurt wheat some years. O. S. B.

CAMBRIDGE, Washington Co.—This is not properly a wheat growing region; but much more was sown last year than usual, and the yield was good, some reporting as high as 40 bushels per acre. The acreage this year is double that of last. I have heard no complaint of the fly last fall. The crop went into the winter looking well; but the winter has been very unfavorable for it—much freezing, and thawing and little snow. A. E.

CHARLTON, Saratoga Co.—The wheat in this section was looking very promising until March 1st. Since then the freezing and sun have changed its color. It does not show any signs of disease yet. The Hessian fly has not injured wheat in this section hitherto. Its general appearance is good, having made a very strong growth last fall. As to acreage, there has been a steady gradual increase in the last few years. F. C.

CLYMER, Chaut. Co.—This is a not a wheat section, there being but a very few acres sown in this town. About three weeks ago it looked green and nice, but since then the frost has yellowed it somewhat. I don't think the Hessian fly has troubled wheat here. The winter has been very mild; but little snow and plenty of mud. It has been a very poor sugar season so far. The farmers generally keep dairy, make butter, and raise most of the calves, which bring from $5.00 to $15.00 each in fall. New butter is worth 25 to 28c; hay, $8. per ton; corn, 55c; potatoes, 35c; and oats 40c. per bushel. J. W. G.

CORNING, Steuben Co.—From close inspection and the general statements of others, I am satisfied that we have not in 10 years had as good an outlook for a large crop of wheat as at present. Up to this time it shows no bad effects from freezing. It covers the ground well and looks unusually green and healthy. The fly seems to have entirely disappeared from this section. I think about an average acreage was sown last fall. C. J. R.

COVENTRY, Chenango Co.—It is too early yet to foretell with certainty the effect of the winter on wheat, but it is considered an unfavorable one. No signs of fly or disease. The acreage is larger than usual. Dairying and sheep raising are more practised here than grain growing; but a great many farmers are raising their own wheat. J. D. M.

DANBY, Tompkins Co.—The past winter has been very hard on wheat in this section. I have seen no signs of the fly or disease, however. I think the wheat looks as fine as it did last spring. The acreage sown is larger, I think. J. E. J.

DUNDEE, Yates Co.—Wheat in this valley has wintered well, considering the drought we had last fall. I think that with a favorable season we will have a fair yield. I do not think it is diseased. Little or no harm has been done by the Hessian fly. The acreage is larger than usual. J. B. M.

ELMIRA, Chemung Co.—The present condition of winter wheat in this section is about 25 per cent. below the average of other years on about an average acreage. Early-sown pieces, where the soil is good, are looking fine, but many fields were sown late and were in poor condition to stand the open winter. Such pieces have suffered materially. However, wheat shows no sign of disease or harm from the Hessian fly, and with a good season will be a fair crop generally, having suffered less from our open winter than was anticipated earlier in the season. G. A. G., JR.

GREENWOOD, Steuben Co.—Wheat hereabouts looks fine. There is no fly. The acreage is about the same as last year. W. A.

GUILFORD, Chenango Co.—There is not a great amount of winter wheat raised in this section, as our land is mainly devoted to dairying. The crop has been winter-killed somewhat up to the present, but not seriously. It shows no signs of disease and is not injured by the Hessian fly. Its general appearance is an average one. Acreage about the same as last year. M. E. M.

HOMER, Cortland Co.—Wheat injured some by freezing and thawing. I have heard no complaint of injury by the Hessian fly. Acreage and appearance about as usual. Not much raised in this vicinity. J. D. H.

JACKSONVILLE, Tompkins Co.—The wheat has so far stood the winter well and is looking better than usual; shows no signs of disease or of harm from the Hessian fly. The acreage is about the usual amount sown in this section. P. H. F.

LOUDONVILLE, Albany Co.—Very little wheat is raised in this town. I have not seen any except my own which looks well and does not appear to have received any damage from any source. L. E. A.

MEDINA, Orleans Co.—Wheat in this section looks 20 per cent. better than it did last year at this time, and there was 20 or 25 per cent. more sown last fall than was sown a year before. There is no sign of disease; nor has the Hessian fly troubled the wheat any. Present indications are that we shall have more wheat the coming harvest than we have had for several years past. W. H. C.

MCGRAWVILLE, Cortland Co.—The condition of wheat is excellent. It has wintered admirably. Its present appearance is healthy, and will compare favorably with any of the ten years past. Acreage thought to be one-sixth larger than in '78 or '79. J. G. B.

NUNDA, Livingston Co.—Wheat in this section has stood the winter well; I have not noticed any signs af disease or injury by Hessian fly. Appearance will compare favorably with former years. Acreage about the average. S. M.

TYRE, Seneca Co.—Wheat in this county looks remarkably well for this time of the year—far better than for a number of years past. It does not show any signs of disease or of Hessian fly as yet. Seneca county has about an average number of acres under fall wheat J. P. M.

WHITNEY'S POINT, Broome Co.—There is a larger acreage of winter wheat than formerly; its general appearance is not as good as last year. The early-sown looks very well: with regard to late-sown, the freezing and thawing have exposed the roots so that many pieces will be very light. The Hessian fly has not made its appearance in our region as far as I know. J. H. K.

New Jersey.

HARBOURTON, Mercer Co.—Wheat looks well. The weather did not affect it until the 9th of March; since then it has been injured. The Hessian fly has not harmed it any. It is looking better this spring than it commonly does. The acreage is larger than last year. C. P

LITTLE SILVER, Monmouth Co.—The wheat crop looks fine. The winter has not injured it in the least. It shows more top for the time of year than it has for a number of seasons. There are a very few pieces that show any signs of the fly. The acreage is about as large as usual. B. H. K.

MENDHAM, Morris Co.—The winter has been very favorable for wheat in this locality; it is looking better than it has for the last three years. It shows no signs of disease or Hessian fly. The acreage sown is fully as large as on other years. B. H. L.

Maryland.

EASTON, Talbot Co.—Wheat has wintered well. No signs of disease or serious harm from the Hessian fly apparent. The general appearance will compare favorably with that of other good wheat years. Acreage larger than usual and the outlook may be summed up as flattering. H. S.

POCOMOKE CITY, Worcester Co.—Wheat is looking good; not injured by the winter. No special signs of disease. So far as my observation has extended, it is not much injured by the Hessian fly. Owing to the mild winter it is in advance of former seasons. The acreage is one-quarter more than usual. W. M. S.

Pennsylvania.

ADAMSVILLE, Crawford Co.—Wheat in this section is looking well, its general appearance comparing favorably with that of other years in spite of the open winter which we have had, It shows no signs of disease, or of being harmed by the Hessian fly. The crop will be about an average. A. E. N.

BERLIN, Somerset Co.—Wheat has stood the winter very well. It does not show any signs of disease. The Hessian fly has not harmed it in the least. Its general appearance is as good as on any other year while I have raised wheat, and a great deal better than last year or the year before. S. B. P.

BOWER HILL, Washington Co.—Wheat in this section looks better than usual at this season. The growth has not been checked very much by freezing. There are no signs of disease that I am aware of, and no complaints about the Hessian fly. The acreage is about the same as in previous years. The last crop has been nearly all marketed. S. MCC.

CLINTONVILLE, Venango Co.—In regard to wheat, I never saw it look greener and better set on the ground. I have only seen one or two pieces that show any sign of the Hessian fly. The acreage will average the same as last year. Wheat is worth $1.40; oats, 45cts.; corn, 40 cts.; potatoes, 35cts.; butter, 30cts.; eggs, 15c. The roads are very muddy. J. A.

LINEVILLE, Crawford Co.—Wheat in this section is being injured somewhat by unfavorable weather, but shows no signs of disease. Some early-sown pieces show signs of the "fly." The acreage is above the average. The prospect, on the whole, is good, perhaps I might say, very good. E. G.

MAYTOWN, Lancaster Co.—Winter has improved rather than injured the wheat hereabouts. The Hessian fly has damaged it less than in years. Its general appearance is very good—above an average. Owing to the system of rotation practiced hereabouts, we can neither increase nor diminish the area of this or any other one of our regular crops. This year, however, the acreage under tobacco will be increased, but that won't affect the space given to wheat. J. A. G.

MILL CREEK, Huntington Co.—Winter has not hurt the wheat. It shows no signs of disease or of any harm from the fly. That sown early looks the best, but it all looks fine in this section—better than for many years at this season. The acreage is larger than usual and we expect a good yield. J. W.

NEW HAMBURG, Mercer Co.—The condition of the wheat is splendid; the winter has been very favorable. It does not show any signs of disease or of the Hessian fly; The acreage is

large, and the prospect for a fine crop could not be better; C. J. G.

PUGHTOWN, Chester Co.—The wheat fields for 30 miles around look good. Some fields sown late last fall did not come up as thick as usual owing to the dry weather. The winter was very mild and no frost was in the ground for a number of days in succession; so the wheat has grown well and looks promising for a good crop. No sign of the fly In February we had April weather. Some potatoes were planted on the 24th. So far in March, we have had light snows and a great deal of rain and a little frost. Wheat has grown fast. Price for wheat, $1 40; rye, 75c; corn, 65c.; oats, 42c.; potatoes, 65c.; hay, $13; butter, 34c.; eggs, 16c.; young chickens, 14c. ₱ lb. R. H.

ROCHESTER MILLS, Indiana Co.—Our late-sown wheat presented a fine appearance through fall and winter months; but March is turning out unfavorable; it is freezing and snowing by night and thawing by day, and this must be very damaging to the crop. It looks as if it would not be half a crop. The acreage is somewhat larger than usual, G. H.

ROCKLAND, Venango Co.—Wheat has been in good condition, and a larger acreage than usual was sowed last fall, but the freezing and thawing of March have hurt it to some extent. The fly has not bothered us much up to this time. G J.

SHARPSVILLE, Mercer Co.—Wheat stood the winter well until the first of March; since then we have had so much thawing and freezing it is not looking as good as it did. There is very slight appearance of the Hessian fly, and no signs of any disease. The crop will average as well as it has done for a number of years, if not better. The acreage is larger. D. J.

UNIONTOWN, Fayette Co.—The wheat in this section of the State looks very promising; it has not been affected by the winter in the least. No fly that I have seen or heard of. From present appearance there will be more than an average crop, the acreage is about an average. J. B. W.

Ohio.

BENNINGTON, Morrow Co.—I think there was about 10 per cent. more wheat sown than last year. Some rusted last fall. Some fields of the early-sown were injured by the fly. The medium-sown looks well; the late-sown has been badly heaved out by the almost constant freezing and thawing for the last two months. It is too soon to decide how great the injury will be. T. W.

BERLIN, Holmes Co.—Wheat here looks good. The fall was dry; but the winter has been favorable and the crop is in a healthy condition. We had a good yield last year—some fields gave 30 bushels per acre, and the entire crop must have averaged 20 bushels, and we expect a still better yield this year. T. L. O.

BUCYRUS, Crawford Co.—We have had an open winter. The wheat looks fine what there is of it. It was hurt by the dry weather last fall. That sowed on sandy or upland soil was not injured and looks well now. There is about one-third more sowed than last year; but I don't think the aggregate yield will be greater. Corn and oats are good crops. D. P.

CADIZ, Harrison Co.—Wheat in this section is looking well, and has not been injured by the winter. No sign of disease nor any appearance of having been injured by the fly. The outlook is that we shall have a full crop. It will compare with that of any other year. T. C. G.

CANAL DOVER, Tuscarawas Co. — The wheat here is less injured by the winter than it was last year. The fall growth was so heavy on rich soils as to cause the crop to rot somewhat in places; but the damage is not extensive. Wheat on poor land is greatly injured by the fly. The acreage under wheat hereabouts is larger, and on the whole the prospect is better than at this time last year. J. K.

CANTON, Stark Co.—The wheat crop in this county never looked better at this season of the year than it does at present, and there is no complaint from our farmers, except, once in a while, one will say, "I am afraid our wheat is too thick on the ground." In this county I think there is from ¼ to ½ more acres out than ever before, on account of timothy and clover having failed last summer, owing to hot and dry weather and that put wheat in again on stubble ground. S. P.

CHARDON, Geauga Co.—Wheat never looked better in this section than it does at the present time. It has stood the winter well. The fly worked "some" last fall, but I think the pest did not injure it much. I think it looks better than it has for several years. More than an average number of acres sown. E M. A.

CHATHAM Ctr., Medina Co.—Wheat is in better condition than it has been for years, the frost has affected it but very little. The Hessian fly troubled it somewhat last fall, but not much. The acreage is a quarter more than last year. W. H. M.

CHESTERVILLE, Morrow Co.—The winter has been favorable for wheat in this part of the country. The last week has been harder on it than all the rest of the season, owing to the continued freezing and thawing. It shows no signs of being impaired by the Hessian fly, and the general appearance of the crop is better than last year. The acreage is larger. E. Y. MEI.

COLEBROOK, Ashtabula Co.—The winter had not affected the wheat until March, now some pieces are damaged by the frost. No signs of disease or of the fly. It does not look as well as last year. The acreage is larger. G. T.

COLERAIN, Belmont Co.—The winter has been very mild. Wheat mostly looks very well, though some pieces are a little yellow. No appearance of fly discovered or heard of. The growth, as compared with that of former seasons, is much more rank. The acreage is greater than usual. Y. B.

CINCINNATI, Hamilton Co.—Wheat well put in came through the winter all right. The fly did some damage last fall in early-sown fields. Owing to the excessive growth, and to the very fine season, some fields required pasturing. Very little injury has been done by frost. The crop is very forward now except the very late sown. The prospect is good for a full average yield, and the acreage is as great as usual in this county. W.

CLEVELAND, Cuyahoga Co. — Not much wheat is raised in this section. Farmers are engaged more in dairying and garden farming, but they are raising more wheat than formerly. As they take pains to have the ground in proper condition, use barnyard manure and superphosphates they seem to be on the right track to make a success of raising wheat. Wheat sowed last fall looks splendid—better than usual. Not enough freezing and thawing to hurt it so far. The Hessian fly did some injury last fall, but we can't now see that it has done any permanent damage. I think there was fully one-third more put in last fall than the year before. G. M. P.

DELAWARE, Delaware Co.—The winter has not injured the wheat around here, except on very wet land. It does not show any signs of disease, or of having been harmed by the Hessian fly. Its general appearance is as good as for two years past, if not better. Spots were injured by the dry weather last fall. The acreage is a good deal larger than last year. M. D.

Dent, Hamilton Co.—Wheat looks well at present. The winter has not hurt it, nor does it show signs of any disease. The fly has not harmed it, except the very early sowings. The acreage is about the same as last year. A. T. P.

EAST CARMEL, Columbiana Co.—Wheat in our section looks very promising; the winter was unusually mild, and up to the first of this month wheat suffered but little from freezing. Some few fields that were not properly put in, are pretty well frozen out, but generally the crop is far better than for several years. The Hessian fly injured some of the earliest-sowed; but its ravages are fast disappearing. The acreage is about a quarter more than last year. J. T.

East Toledo, Lucas Co.—Wheat in this section is coming through the winter in first-rate condition. Where it was sown on low, mucky land the dry weather last fall killed it out; but on the high land it is looking good—fully as good as last year. I think there was fully one-third more sown than ever before, and the prospect at present is that the next harvest will be the largest ever gathered. T. C.

ELYRA, Lorain Co.—Wheat is good in every respect at present; no winter killing; no signs of disease; no fly. General appearance much better than on former years; acreage one-tenth more than on last year. R. W.

Farmington, Trumbull Co.—Wheat looks exceedingly well, the winter being very mild, has not damaged it. It does not show signs of any disease or of being damaged by Hessian fly. Its general appearance is better than common, at this time of year. The acreage is somewhat larger than formerly. J. O. M.

HINCKLEY, Medina Co.—Wheat is in very good condition; it has wintered well. Does not show any signs of disease, or of having been hurt by the fly. The acreage is large—probably one-third more than last year. We are having very fine weather. N. E. W.

LEVERING, Knox Co.—Wheat on bottom or gravel lands is in splendid condition; on clay lands March has been a hard month for it, freezing or heaving it out. The Hessian fly is doing some damage, but only in spots. No special disease. Red rust last fall did not do as much damage as was feared, it being something new in this locality. The acreage is fully one-third more than last year. On the whole, the prospect is above the average. J. O. L.

Lodi, Medina Co.—Most of the wheat in this vicinity looks well—better than it did last spring; but we are having bad weather for it now. I did not hear of the Hessian fly hurting the wheat last fall but some pieces appeared to be rusty. The wheat on these died out somewhat, and what remained does not look so well now. I think the acreage is about the same as last year. S. C. M.

Millersburg, Holmes Co.—In our section the wheat promises a large crop; the winter has hurt it but little—no signs of any disease. No effects from the Hessian fly. The past three years we have had large crops—and the present is equal to any of them, while the acreage is much larger. G. W. M.

MILTON, Mahoning Co.—Wheat generally looks well. It was not injured much until the late frosts struck it. It looks somewhat spotted in places; but shows no signs of injury from the fly. The acreage is greater than for many years. B. F. B. JR.

Mt. Repose, Clermont Co.—In this neighborhood the acreage of wheat sown is at least one-third more than last year; present condition pretty fair, but the last month or two have been quite severe on it. The Hessian fly has troubled a few fields badly. Its general appearance is as good as last year, and better than for several years previous. The continued wet weather, with freezings and thawings, has injured prospects that were considered very fine. J. P. H.

New Lisbon, Columbiana Co.—The condition of wheat appears better than an average. It does not seem to be diseased. The fly has hurt some fields, but not badly. The acreage is about one-third above an average. The winter was not very severe on the wheat; it has been growing almost all the time. E M.

OBERLIN, Lorain Co.—Wheat is looking unusually well in this section, it having made a heavy growth during the favorable fall and mild winter. The acreage is unusually large and but slight damage has been done thus far by either frost, fly or other pests. A heavy crop is anticipated. Many of our farmers applied fertilizers to their wheat land last fall for the first time. It tells. T. H. W.

PAINESVILLE, Lake Co.—In this county and parts adjacent, the wheat crop was looking quite well until about the 1st of March, since which time the freezing and thawing and the drying winds have caused much damage, especially on flat, clayey soils. The farmers are slow to learn that this can all be prevented by thorough under-draining. In many fields the damage sustained this month would more than half pay the cost of under-draining. Peach and other fruit buds continue to look well, although the recent freezing has been severe upon them, considering their forward state. M. B. B.

PULASKI, Williams Co.—The last few weeks were very hard on wheat—too much freezing and thawing. On black, mucky soil all died early in winter from some cause not easily accounted for. Some fields still look fine, especially on sandy or gravelly soil. No Hessian fly yet. The acreage is a little over an average, but the prospect now is for no more than an average crop. A few spots in highly-manured fields are like the mucky spots; in others all is killed. The ground is getting too dry now for wheat to do well. J. J. R.

RAVENNA, Portage Co.—Wheat at present is looking fine; no signs of any disease. The Hessian fly has done no harm in this section. The acreage is rather larger, I believe, than common. W. S. C.

RIPLEYVILLE, Huron Co.—We have had a very mild winter—but very little snow and a great deal of rain and mud. The wheat crop bids fair to be a very good one. The acreage sown is larger than last year. It shows no signs of injury from fly or disease of any kind. Feed is scarce. Hay is selling for $12 per ton; oats, 38c; corn, from 50c to 60c; wheat, $1.25. I. G.

SAVANNAH, Ashland Co.—Wheat is in the best condition I have seen it in this section for the last 26 years, the winter having been the most favorable to it in that time. I have neither seen nor heard of any disease affecting it. There is not the least sign that the crop has been hurt by the fly. The acreage is far larger than in any year during the above named period. Weather good, roads bad. J. C.

Willoughby, Lake Co.—Wheat in this section is looking very fine; the winter has not damaged it. It shows no signs of any disease or of the fly as yet. The acreage is larger than it has been for years. J. W. P.

ZANESVILLE, Muskingum Co.—The winter here has not injuriously affected the wheat to any appreciable extent. So far as I can learn, it shows no sign of disease. I have not heard that the Hessian fly has done any serious harm. Its general appearance is much better than last year and it promises a splendid crop, if not injured hereafter. The acreage of wheat sown this year is about one-third larger than last year. T. F. S.

WESTERN STATES.

Michigan.

ALLEGAN, Allegan Co.—The condition of wheat is good; the open winter has not seemed to injure it; it does not show any signs of disease, or of having been harmed by the Hessian fly; its general appearance is better than that of most other years. The acreage is larger. H. D. E.

Ann Arbor, Washtenaw Co.—The past winter has injured the wheat in this section but very little. The crop looks very healthy and shows no apparent signs of disease. Very little injury has been done by the Hessian fly or any other insect. The weather last fall was unusually warm and wheat made a great growth—the fine top has protected the roots, so that it has come through the winter looking better than usual, and promises a fine crop. J. D. B.

Benton Harbor, Berrien Co.—Winter wheat is injured but very little by winter; shows no signs of disease; is not damaged by the Hessian fly; its general appearance is as favorable as in any former year. The acreage sown is larger than in '79. Farmers look for a good crop unless it is injured in the future. W. G.

BRADLEY, Allegan Co.—The winter has been hard for wheat on clay land. The growth last fall was large and tender. The hard frosts hurt it. The Hessian fly has done but little harm. The crop appears as well as that of last year and the acreage is larger. H. F. B.

BURR OAK, St. Joseph Co.—Wheat looks fine. It has not been injured at all by the winter. No complaints of disease or the fly. Compares well with crops of former years at this season. Acreage larger than usual. S. H.

East Dayton, Tuscola Co.—Early-sown wheat here is not damaged; late-sown is badly killed. No disease or fly. The general appearance of the crop is about the same as last year, and so is the acreage. L. P.

GRAND LEDGE, Eaton Co.—Early-sown wheat looks very well indeed; the frost has killed little patches here and there, but not enough to harm it much. It has had to do without its usual covering this winter, as we have had but very little snow. Late-sown looks bad. I have seen no signs of any disease in it. The Hessian fly worked in it a little last fall, but it seemed to do but little damage in this locality. Take it all in all, I think the crop promises as well as in other years, and double the number of acres has been sown. J. E. H.

GRAND RAPIDS, Kent Co.—Wheat is looking fair; no disease save decay occasioned by fly; center stalks of early sown, gone; but warm fall caused it to tiller well, and it will come out right, if March is not too severe. Wheat looks more brown than last year; but the roots are good and I opine we shall have a good yield. The acreage is smaller than last year in this vicinity. The open winter has been very severe on fields sown late, but most of our sowing was done by Sept. 15th. My own field of 20 acres was sown in August, and was yellow with fly until side shoots sprang out and created a new green. C. W. G.

Kalamazoo, Kalamazoo Co.—Wheat in this section wintered well and looks about the same as last spring, which is better than it has generally averaged the past few years. It shows no signs of disease. The Hessian fly worked somewhat last fall, but the wheat grew so rapidly that it is thought not to have injured it much. Acreage about the same as last year. J. T. C.

LANSING, Ingham Co.—Wheat looks dingy and in some places damaged, but generally it looks very well. It is too early yet to predict; for March and April are very often the hardest months of the year on wheat in this State. Acreage larger than last year a little. Flies are not bad. W. J. B.

LEBANON, Clinton Co.—Wheat in this section is looking well, the winter not seeming to have hurt it, except in a few cases. No signs of any disease are apparent at present. Some fields seem to have been damaged quite badly by the Hessian fly, but this is not generally the case. The number of acres sown this year is less than last. J. T.

MONTGOMERY, Hillsdale Co.—The wheat has experienced some injury on clay soil; but not as much as the average of other years. The breadth sown is larger than last year, and the crop looks better. There is no sign of the fly. The winter has been remarkably mild, not one old-fashioned snow storm or one day of good sledding. Present prices: wheat, $1 20; oats, 37@39c.; clover seed, $3.75@4; timothy, $2.25 per bush.; potatoes, 30@35c.; corn, 35@40c.; butter, 16@18c. per lb.; eggs, 8c. per doz.; hay, $6@8 per ton. C. H. E.

MORENCI, Lenawee Co. — More wheat was sown in this section last fall than in any previous year, and it has, as a rule, wintered well. I don't think the fly has hurt it at all; but if the present dry, windy weather continues a week longer, it must injure the crop. C. C. W.

MORRICE, Shiawassee Co.—The wheat in our section is looking well. No signs of being winter-killed, and the winter has been so open

that we do not think that the fly has damaged it much. Its appearance compares favorably with that of other years—the acreage is larger. J. D.

MUSKEGON, Muskegon Co.—This is a rather sandy region and is not affected, like clay, by the extreme scantiness of the snowfall the past winter. I never saw any Hessian fly or wheat midge here, nor do I know of any disease or insect specially injurious to wheat here. I think there is an increase of acreage, but only about equal to the increase of the clearing up of new land. Farming is not the most prominent business of this Lake Shore region, for fruit growing is the most important part of our agriculture, and lumber manufacture the most prominent business. S. B. P.

Orion, Oakland Co.—Wheat hereabouts looks well. It was not damaged seriously by the Hessian fly. On low lands it has been somewhat lifted by the frost, but the percentage of low land is very small. The general appearance is fine compared with other years; acreage larger than last year. C. K. C.

Owosso, Shiawassee Co.—Wheat in this and adjacent counties, on light soils and ridges, looks well; on porous, loamy and undrained soils it is badly heaved out. Many spots, and some whole fields are utterly ruined. Loss, as now estimated, one-fourth. Present weather and prospects are unfavorable. Comparatively it does not promise so well as a year ago. The general opinion is, that the damage done by the fly is comparatively slight. The acreage is probably 10 per cent. greater than usual. Clover is universally and badly thrown out, therefore the hay crop will be very short, and the subsequent clover seed crop light. M. H. R.

READING, Hillsdale Co.—Taking 100 as the average of condition and acreage of winter wheat here, the acreage under the present crop may be put at 110, and its condition at 100. L. W.

Ridgeway, Lenawee Co.—The winter has not hurt wheat much; some pieces that were sown early and on stubble are injured by the fly, but it is not general. It is looking fine in most places in this county, and will compare favorably with that of other years. The acreage is nearly one-fourth larger than last year. C. C. V. H.

SOUTH HAVEN, Van Buren Co.—Wheat in this region has come through the winter in good condition. It is but slightly browned; shows no signs of disease; is not affected by the Hessian fly. It was farther advanced than usual last fall, in consequence of continued warm weather. The acreage is considerably above that of last year. So far the prospect of another good crop is excellent. T. T. L.

UNION CITY, Branch Co.—In this section wheat is generally looking fine, especially on sandy soils. Some pieces on heavily timbered land are seriously injured by frost, being heaved out of the ground. Very little complaint about the fly. More wheat in the ground than ever before. C. C. L.

Indiana.

BLOOMING GROVE, Franklin Co.—The winter did not harm the wheat until within a month. The frost and snow since then have given it a scorched appearance; but I think that will not amount to anything serious. No signs of disease; but little harm from the fly. Its general appearance compares well with that of other years. The acreage is larger. The scorched appearance spoken of above is where the ground was too wet, and the wheat was thrown out somewhat. C. F. H.

COLUMBIA CITY, Whitely Co.—The wheat crop is a fair average. No disease or fly, and the acreage is greater than usual. Just now the weather is a little too dry. Winter has not affected the crop much only in low places. W. S.

CROWN POINT, Lake Co.—The condition of winter wheat is fair; not as good as last year; injured somewhat by the open winter; no signs of disease; no injury from the Hessian fly; acreage larger than heretofore. This section of country is not adapted to winter wheat. D. K. P.

Harrisburg, Fayette Co.—In a residence of sixty years in this county I have never seen a better condition of the wheat crop. It is neither winter-killed nor injured by the Hessian fly to any considerable extent. The acreage is larger than usual, perhaps by twenty per cent. WM. W. T.

Ingalliston, Marion Co.—Wheat has wintered fairly well. No Hessian fly. Not killed by frost to any considerable extent. The acreage is about an average one. This immediate section is not largely a wheat-growing country—more corn. The general appearance of wheat is better than usual at this season. G. J.

La Porte, La Porte Co.—The winter has not injured wheat to any extent in this section. There are no signs of disease in it. In its general appearance it compares very favorably with its condition in other years. The acreage is considerably larger than in other years, and the prospect is flattering for a fine yield in this section. W. E. R.

Lima, La Grange Co.—Wheat in this county has never looked better or healthier at this time than now. Acreage about as usual. J. S.

MOOREFIELD, Switzerland Co.—Wheat looks well in this section; some pieces, however, are injured by the fly, and on level land some are damaged by the wet weather. J. C.

PLEASANT LAKE, Steuben Co.—In this section we have a variety of soil—oak openings and timber—the winter has been very open; no snow of any account, but a great deal of rain, so that the wheat where the water stood any length of time, has been drowned out. We have no Hessian fly. I think the general appearance is as good as last year. The acreage is as large as on other years, but the season may affect it for the better or worse yet before the settled weather begins. H. B. D.

Terre Haute, Vigo Co.—The prospects for an abundant wheat crop in this part of Indiana, are most flattering. The winter, though considered unfavorable for the crops by many farmers, has proved the contrary. The ground is completely covered with the plant, and the growth is farther advanced by a month than at this season in many years past, and there are no signs of any disease or of harm by the Hessian fly. D. R.

Illinois.

APPLE RIVER, Jo Daviess Co.—Wheat is nearly all winter-killed, as far as I can learn. No chinch bug, Hessian fly, or disease. Acreage large. Crop looks worse than usual. G. H. W.

ALBION, Edwards Co.—Wheat does not look so well as during the last two seasons. It is going down badly on account of wet and frost. A considerable amount was ruined in Wabash county by the fly, and was seeded the second time. Some will be plowed out this spring. The acreage is fully as large as in any previous year. J. T.

ASHLEY, Washington Co. — As a general thing the winter has not hurt our wheat in this section. It has a healthy appearance. In some fields the Hessian fly injured it in small spots only. The prospect is good for a large yield. The acreage is larger, I think, than ever before. The winter was very mild here, with a great deal of rain. M. J. C.

AURORA, Kane Co.—Wheat is killed very badly by the frost. There was more sown than usual. F. C.

BERLIN, Sangamon Co.—Wheat badly winter-killed to the extent of fully one-third. No signs of disease or harm from the Hessian fly. Its general appearance is not equal to that of former years, but the acreage is from one-third to one-half greater than last year. S. H.

BUNKER HILL, Macoupin Co.—The ground was very well prepared for wheat last fall, and fully 33 per cent. more was sown than ever before. The seed all germinated and made a good "stand." The crop was injured slightly by dry weather in January; but it looks very fine now in this and the six adjoining counties. There is a great variety of opinion in regard to the "fly;" some say it lays its eggs in the fall, and hatches in spring and works in the stalk; others equally well informed, say there is another fly which lays the eggs in spring. I have not examined it; but am told that "the fly is awful" in the wheat; but it looks very promising, indeed, and we all feel very much encouraged. W. W. H.

CHERRY POINT CITY, Edgar Co.—Wheat looks very well; the weather right now is rather hard for it. The fly hurt some pieces; there is more sown than common, and it looks very well. S.

CISNE, Wayne Co.—The very open winter has been very hard on the wheat; the light freezing has damaged it more than anything else. No disease is perceptible. The fly has not harmed it, and it will compare favorably with other years. The acreage is larger by one-third than was ever known. N. A. T.

COATSBURGH, Adams Co.—Wheat looks bad. A considerable amount of it will be plowed up this spring. The dry weather last fall hurt it much, and there is some fly in it. It will average about half of last year's crop. J. S.

DANVILLE, Vermillion Co.—Wheat in this section looks quite well for the time of year—much better than usual. Very little has been winter-killed, and I think it has not been injured by the Hessian fly to any extent. Its general appearance is better than the average. The acreage in this county is nearly double that of any other year. I have resided here over forty-five years. R. T. L.

ELMIRA, Stark Co.—Wheat badly injured by the winter which has been open, with frequent freezing and thawing. No damage from the fly. The poorest prospect for a crop we have had for years. For the past two or three years we have had good seasons and farmers ventured a larger amount than has been sown for a long time, as last year led us to believe that it would be useless to sow spring wheat this year on account of the chinch bug. This pest has wintered through finely, and with an average dry summer we can raise enough to supply the world. E. R. B.

FAIRFIELD, Wayne Co.—The prospect for winter wheat here is good—better than for several years. The winter has not harmed it much. We have seen no signs of disease, or of the Hessian fly. The acreage is larger than for six years. E. H. R.

FOUNTAIN GREEN, Hancock Co.—Wheat does not show any sign of disease, or of being injured by the Hessian fly. Its general appearance does not compare well with that of other years. The acreage is smaller. J. Y. S.

GALESBURGH, Knox Co.—The wheat around here has been nearly killed. We have had no snow. I do not think it has been troubled by the Hessian fly. The acreage is larger than usual. Last year there was a good crop and many farmers put in some wheat this year; but it is not a very good wheat country around here. A. P. H.

HOOPESTON, Vermillion Co.—Wheat has been considerably injured of late by frost. No signs of disease or Hessian fly. The general appearance of the crop compares favorably with that of former years. The acreage is half as much again as during any previous year. We expect a good crop, future mishaps barred. C. B. A.

HUGO, Douglas Co.—Unquestionably wheat is in fine condition here. So far I have heard no complaint of serious winter damage or of the fly. It compares favorably with other wheat years "of notoriety." Acreage larger—40 acres have been sown to 10 last year. Of course, in all this hurry and blindness, many fields were "half put in" and a severe fall drouth gave it little aid; yet wheat properly put in—and there is double the usual amount of this class—looks fine and is coming on now rapidly. A. C. W.

JOSLIN, Rock Island Co.—Neither my neighbor's wheat crops nor mine has suffered from the frost. We are the only persons in this district that sowed wheat last fall. I have four acres, two of which I covered with straw; one I top-dressed and the other I left bare. The wheat covered with straw is more forward than the rest; the top-dressed is stronger than that left bare. As far as I can tell, no disease has affected it and no Hessian fly. In a large district (at a distance of five or six miles) the wheat is reported half winter-killed. I can't imagine what could be the difference, as both districts are on Rock River bottom and a sandy soil. The acreage of winter wheat has increased. J. C. A.

MILO, Bureau Co.—Wheat looks bad, almost all winter-killed, owing probably to the open winter we have had, as it looked well in the fall. It shows no signs of disease, and is not troubled by the Hessian fly. Last year wheat was good and a large acreage was put in this year. Of late years there is very little wheat sown, as it is not a sure crop in this section. J. G.

MT. CARROLL, Carroll Co.—Winter wheat we think, has wintered all right so far, but did not get a very big growth last fall, and looks thin on the ground; no disease, and there is no Hessian fly. Acreage about double that of last year. J. C. S.

NORMAL, McLean Co.—Nearly all the wheat in this section is winter-killed. Generally only a little wheat is raised here, but last year we had good crops, consequently a much larger acreage was sowed this year, but I think it will be almost an entire failure. G. C. R.

ODIN, Marion Co.—Wheat is damaged by too much wet and freezing on our flat land. No signs of fly. The prospect is not an average one compared with those of the last three years. I think it will fall short one-third per acre. The acreage, however, is 50 per cent. greater than ever sown before. J. P.

ONARGA, Iroquois Co.—Wheat in this neighborhood has been somewhat injured by the freezing and thawing of the past open winter. No signs of any disease that I know of. No Hessian fly. There were many more acres sown last fall than usual; the prospect is fair for a tolerably good crop this year. I. B. C.

PALATINE, Cook Co.—There is no winter wheat around here to speak of. I only know of one piece about an acre, and it is badly winter-killed. I don't think there are 25 acres in the whole county. I have never seen or heard of the Hessian fly here. We did not raise winter wheat when the country was new. C. M. C.

PAW PAW GROVE, Lee Co.—Wheat hereabouts is badly winter-killed. I think there is no show for a crop. The acreage is larger than for many years. R. S.

PELLSVILLE, Vermillion Co.—But little fall wheat sown in this section; what there is has been winter-killed—it has not been covered with snow once. C. S.

ROCK FALLS, Whitesides Co.—We have never raised much winter wheat in this county, and for several years the crop of spring wheat has been so uncertain that farmers have hardly ventured to sow largely. Last year the snow remained on the ground and the small amount of winter wheat which is always tried as an experiment, produced such a remarkable crop that quite a large amount was sowed last fall. The result, so far as I know, is: the Odessa is completely winter-killed and other kinds of real winter wheat are much injured by repeated freezing and thawing, but promise to recover. No disease or insects that I have heard of. G. W.

ROCKFORD, Winnebago Co.—But little winter wheat has been raised in this county; but about four times the acreage of last year is now growing. Its general appearance is somewhat better than last year. The Hessian fly does not appear until late in the season. Until the past two or three seasons no winter wheat was raised here for a number of years. E. L. H.

SALEM, Marion Co.—Where the drainage is good the wheat looks well; where it is bad, the wheat is generally dead. It shows no signs of disease—only as above stated. At present we see no damage from Hessian fly. The crop looks better than last year at this time. The acreage is thought to be 25 per cent. more than last year, and some think it more than that. G. H. W.

SHELBYVILLE, Shelby Co.—The wheat during the winter, in my neighborhood, looked very well, particularly the earlier-sown; but during the last two weeks the changeable weather has damaged it a good deal—some has been heaved out. The late-sown looks bad. The fly was in the earlier sown, but the late growth in fall overcame it in a great measure; the outlook is hardly as good as last year. The acreage is much larger. W. P.

STERLING, Whitesides Co.—Wheat of the Odessa variety comes up very nicely and made a fair growth. Mine is the best in our neighborhood. I plowed my ground very early, and consequently it became so packed that the frost has not heaved it the same as it has in loose soil. I see no difference between that which was drilled and broadcasted. Until the past fall very little wheat was sown here in the fall, so I cannot compare the present with previous crops. The last general fall seeding was in 1856, when people lost all their seed; since then we have been putting in spring wheat. No Hessian fly here. O. H.

SULLIVAN, Moultrie Co.—Wheat in this part of the country was injured somewhat by the freeze in March where sown on corn ground. It doesn't seem to be injured in any other way. It looks better than it did this time last year. The acreage is one-third more. J. Z. M.

SUMNER, Lawrence Co.—Growing wheat in this vicinity looks well and promises a full crop equal to last year's. More than the usual acreage has been planted. Less complaint than usual of the fly or winter-killing. Farmers are very hopeful with present prospects. J. M.

UTICA, La Salle Co.—The acreage under wheat is much larger here than usual. Nearly all of it is badly wintered-killed; on very high ground it is not so much injured as elsewhere. The wheat crop of 1880 will be much smaller than usual in this county. No disease or fly. F. B. W.

VOLO, Lake Co.—The winter wheat crop in this part of the county is badly winter-killed. The winter has been very wet here, with alternate freezing and thawing until the last two weeks. The clover is very badly hurt, and this is of more importance than the winter wheat. The acreage of wheat put in last fall was double that of the year before. T. D.

Wisconsin.

ALBION, Dane Co.—Winter wheat has been badly killed during the last two months of open weather. Some signs of Hessian fly. It looks sickly in comparison with its condition in the last three years. The acreage is four or five times larger than last year. The yield last year was from 16 to over 40 bushels per acre. H. M. S.

BEAVER DAM, Dodge Co.—The winter has not damaged early-sowed wheat. The crop has not been harmed by the fly. Its general appearance is fair; but not as good as last year. The acreage of winter wheat is three times that of last year. J. W.

BELOIT, Rock Co. — The winter was very favorable for winter wheat. But if it does not rain or snow soon, I fear the grain will suffer. The acreage under the crop is somewhat larger than usual. The fly we do not fear, but we do the chinch bug. F. T. R.

BROTHERTOWN, Calumet Co.—Winter wheat is a failure in this section. It looks the poorest crop for many years. I don't expect half a crop. Quite a large acreage was sown; but the open winter has killed it out. Spring wheat, however, is the main crop here. Of it six times as much are sown as of winter wheat in this section. It was damaged considerably by chinch bugs and drought last year. J. P.

BURLINGTON, Racine Co.—Fall wheat so far looks well and has stood the winter better than usual, and it was an open winter with us. Only a small acreage was sown in this part last season; it is mostly spring wheat that we raise

here, and farmers are about ready to begin to sow, and if nothing occurs to prevent them, the acreage will be larger than last year. The average yield of spring wheat per acre in 1879 was about 13 bushels, while I hear of fall wheat that yielded per acre as high as 42, and as low as 20 bushels. A larger acreage of fall wheat will be sown this coming fall. W. P.

DARLINGTON, La Fayette Co.—This section of country has not been considered good for winter wheat. For two years past, however, good crops have been raised. Last fall much more was sown than usual; it now looks bad. The open winter and dry and cold winds of March, it is feared, have killed it. No Hessian fly in this section. J. B. M.

DE PERE, Brown Co.—Not much winter wheat is raised about here; spring wheat is the principal crop; but there is an increase of 50 per cent. of winter wheat over last year. It generally looks well. No Hessian fly. The prospect is fair for a good yield. H. P. C.

EAGLE, Waukesha Co.—The winter wheat is about half killed, and if the weather keeps freezing nights and thawing days, as it has done the past two weeks, it will all soon be dead. The ground is dry. The acreage is much larger this year than last. There has not been much winter wheat raised in this part of the State the past ten years. There is no Hessian fly. J. S.

ELKHORN, Walworth Co.—Wheat is a miserable failure. Since the fore part of January there has been no snow of any consequence on the ground, so but very few pieces of wheat have lived through. That is the general opinion at present. There is no disease, and no harm from the Hessian fly. Last year there was not much area to winter wheat, but the yield was remarkably large—from 20 to 40 bushels to the acre. Consequently, winter wheat was all the cry, and the acreage was increased and nearly the whole crop used for seed. Now spring wheat will likely be seized on, as for the last fifteen years. Clover is heaved badly. S. D. H.

FORT ATKINSON, Jefferson Co.—The acreage of winter wheat is twenty per cent. greater this year than last in this neighborhood. That sown on good soil is all right yet, as it got a good start in the fall. The Clawson stands our winters the best of any variety. No disease or fly as far as I can find out. The general appearance of the crop is not as good as it was last year, but it is better than the average of several late seasons. Rain or snow soon will generally make it all right. The same remarks apply to clover. L. M. R.

GREEN BAY, Brown Co.—Wheat got a good growth in the fall and was not injured until Feb., when the thawing and freezing killed some in exposed situations. No signs of disease. No Hessian fly. The present condition, compared with that of other years, is favorable. The acreage is from five to ten per cent. more than last year. For the last two weeks it has been cold with two or three small falls of snow. No sugar weather yet. Winter was pleasant and lingers long. T. B.

MARSHALL, Dane Co.—The winter has been hard upon wheat; but upon close inspection. I think it is not much killed. No Hessian fly. The crop does not look so well as last year; the acreage is larger than ever before. T. H.

MAUSTON, Juneau Co.—Winter wheat poor hereabouts. Some pieces on unprotected land have been killed. Cold, dry winds caused the mischief—no fly has put in an appearance. It does not look as well now as at this time last year. More wheat was sown in this county last fall than ever before. G. T. C.

NEW LISBON, Juneau Co.—The winter has been open; no snow to speak of. Wheat and rye are badly killed, probably not more than one-fouth of a crop of either is left. It is too early yet to tell the true condition. No Hessian fly in this section. P. C. C.

OCONOMOWOC, Waukesha Co.—Wheat has been badly winter-killed, excepting the variety known here as Missouri Blue Joint, which seems to be all right yet. I have not seen any signs of disease or Hessian fly. Fully three times more fall wheat has been sown than usual. That not killed is about on an equality with other years in regard to general appearance. Clover nearly all killed. J. J.

OMRO, Winnebago Co.—This has been a mild winter here. Since the first of January wheat has suffered severely from the constant freezing and thawing, especially on the low lands, and that which was sown late. No signs of the Hessian fly, but it is too early yet to predict immunity from loss with certainty. The acreage sown is the largest for many years. H. P.

OGDENSBURG, Waupaca Co.—The general opinion is that wheat is very badly damaged by freezing and thawing—winter-killed. No complaint of the Hessian fly. Its general appearance as compared with other years, is not good. The acreage is larger than for many years. W. H.

OSKOSH, Winnebago Co.—Wheat here does not look very promising. No insect has hurt it, but it is badly winter-killed. Little or no snow all the winter. More fall wheat was sown than ever before, as spring wheat is the kind mainly depended upon. It is too early yet, however, to ascertain exactly how much it has suffered. J. N. C.

SALEM, Kenosha Co.—There is but very little winter wheat sowed in this section. What there is looks well. It shows no signs of disease or Hessian fly. It compares well with the crops of other years, if it is not better. We are sowing spring wheat here now. P. Y.

SHEBOYGAN FALLS, Sheboygan Co.—The acreage of winter wheat is probably three or four times as large as usual. It generally got a heavy growth last fall. There has been but little snow, and the season is not far enough advanced to decide whether it will be injured or not; but the prospect seems favorable, considering it has been exposed to freezing and thawing. Have heard no complaints of injury by the fly. J. A.

SLADE'S CORNERS, Kenosha Co.—Very little winter wheat has been sown in this vicinity. Well protected pieces are in fair condition. No Hessian fly or disease. Its general appearance is quite up to the average, and the acreage is larger than usual. E. F.

SYLVESTER, Mecostie Co.—The wheat in this vicinity has been badly winter-killed. We have had no snow since New Year's, and then but very little. It does not show any signs of disease as far as I can see. The Hessian fly is unknown here. The appearance of the crop is not nearly as good as on previous years. The last two crops of wheat were extra good, and that induced farmers to sow quite extensively last fall. Even those that had not sowed any for seven or eight years were affected by the mania. A few days more of this dry weather and we will all say wheat is a failure. Clover is very badly killed. M. S.

WAUTOMA, Waushara Co.—The acreage of winter wheat is nearly 50 per cent. greater this year than last; almost every one has tried a little. Mine looks as if it was killed out entirely, while that of one of my neighbors looks as if it will be a fair crop, though, as a whole, wheat will be a failure. As for the Hessian fly, I have never seen it. I have asked among the neighbors and they have never seen it. J. G.

Minnesota.

AUSTIN, Mower Co.—There are only a few pieces of fall wheat in this section, and what there is has a sickly appearance and doesn't promise a success. J. A. T.

DULUTH, St. Louis Co.—Very little wheat is sown in this section; small crops only within 100 miles. The Red River Valley, of course, does not come within this limit. The small farmers seem to have fair success with their crops, however. J. G.

LE SUEUR, Le Sueur Co.—Winter wheat is looking well; not affected by the hard winter. No signs of disease. General appearance compares favorably with that of last year. Acreage about the same as last year. The principal crop here is spring wheat. H. C. S.

WINONA, Winona Co.—This is mostly a spring wheat country with a partial failure for the last two years of the spring crops. A considerable amount of winter wheat, however, was sown last fall and the present appearance is that the open winter has mostly killed it. G. A. W.

Iowa.

ATLANTA, Cass Co.—The acreage under winter wheat is much greater than in other years in this county. I do not know of an acre of it, however, that is now alive to any extent, as it has all been winter-killed. The season has been mild and without snow—and, in the main, dry. F. S.

BELLE PLAINS, Benton Co.—In this section of country, from all appearances and according to the opinion of all that sowed wheat last fall, it is entirely winter-killed. A few farmers sowed in the fall of '78 and harvested a good crop last season, which induced many to sow a few acres as an experiment, and they may try again, for every one knows that wheat could not live through such a winter as this past has been, without snow or rain, with continual freezing and thawing. No spring wheat sowed yet. H. L.

BIG GROVE, Pottawattamie Co.—The wheat in this section is nearly all killed owing to the absence of its usual blanket of snow during the winter, but a large breadth of spring wheat is being sown. Our main crop, however, is corn. What wheat was sown last fall was merely put in as an experiment, as this climate is not suited to fall wheat, for we seldom have snow enough to make good sleighing. E. P.

BLUE GRASS, Scott Co.—Wheat all through this section is an entire failure owing to the alternate freezing and thawing. No signs of the fly. The acreage is much larger than usual. H. H.

BURLINGTON, Des Moines Co.—Wheat is very badly winter-killed, except on new or sod ground. No signs of Hessian fly as yet. The appearance of the crop is not as good as in former years. Acreage very large—larger than ever known before. W. P. P.

CAMANCHE, Clinton Co.—Fall wheat is thought to be all winter-killed. I know of but one piece that will probably be harvested. It was thought last fall that the chinch bug was injuring the wheat. I do not know anything about the Hessian fly. Last season fall wheat was good; consequently more was sown than usual. Spring wheat is considered hardly worth sowing on account of the chinch bugs. H. B. S.

CLARINDA, Page Co.—Winter wheat about an average condition. Late sowing is best; a greater amount has been put in than last year. We raise more spring than winter wheat in this county. The Hessian fly is scarcely known. Wheat is free from disease so far. There is a fine prospect for fruit. We have had splendid weather since the first of January. G. B.

DAVENPORT, Scott Co.—There is not much winter wheat raised in this section; but there was a larger acreage sowed last fall than usual, and from all the information I can get, it is about all winter-killed. Winter wheat does well here only about one year in ten—the winters are too open, no snow, and the freezing and thawing in the rich prairie soil heave the wheat out. We shall plow the fall-sown wheat up and sow spring wheat. G. W. S.

Denison, Crawford Co.—Not much winter wheat raised in this section. Some spring wheat has been already sowed, and more will be put in this spring than ever before. The Hessian fly has never visited this part of the country. Corn thrives here better than wheat. The former runs from 50 to 75 bushels per acre, while the latter crawls from 12 to 20 bushels. J. C. S.

DES MOINES, Polk Co.—We had an unusually mild winter, with but little snow or rain. Fall-sown wheat looked well up to February. In that month light rains, with frequent freezings and thawings of the fields, together with the bare condition of the ground, caused the wheat to turn out a complete failure, which will cause a heavy loss to farmers. G. B.

FREDONIA, Louisa Co.—All of the wheat put in last fall, that I have seen or heard of in this vicinity, is dead, or so nearly dead, that it is not worth saving. Most of the fields will be sown to spring wheat; some to oats. I think the fly has not troubled it; it is simply the weather—warm until Christmas; then a severe cold snap; since then freezing and thawing. This is not a fall-wheat region; but farmers got wheat-crazy last fall and there was more put in than ever before—some of it quite late. The fields are as brown now as old stubble. H. J. B.

HAZLETON, Buchanan Co.—This has always been a spring wheat region. Winter wheat has been an experiment here for the last three years. Acreage increasing each year. Have had but little snow and much freezing and thawing weather this winter. Some fear that it has been injured by the weather, but reliable observers consider it mostly all right. No complaint of Hessian fly. J. B. B.

IOWA CITY, Johnson Co.—The acreage of winter wheat sown last fall in this vicinity was about twice as great as usual. It looked well in the fall, but the winter has been so open, with constant freezing and thawing, that it is nearly all killed. Most of it will be plowed up. The Hessian fly has never done any serious harm here. O. C.

LE MARS, Plymouth Co.—This is not a winter-wheat-growing section. There has never been any tried here until last fall. Then several small pieces of from 25 to 50 acres were sown as an experiment, all of which, as far as I have heard, have been nearly or quite killed out by freezing and thawing during our open winter. A. S.

MCGREGOR, Clayton Co.—Late-sowed wheat has been injured more than early-sowed. No sign of Hessian fly. The appearance shows more damage than last year. A larger acreage has been sown than ever before. H. A. L.

NEW HAMPTON, Chickasaw Co.—The raising of winter wheat in this locality is an experiment. In '78 there was a small quantity sown, which did well. Last year saw a large increase of acreage sown to it; but the thawing and freezing of the past winter ruined it. The ground will be sown to oats or planted to corn. J. W. O.

Redfield, Dallas Co.—In this section the weather has been so dry and there have been so much freezing at night and thawing by day that nearly all the winter wheat has been killed. No fly or disease—the alternate freezing and thawing are the only things that have hurt the crop. W. M.

RICHLAND, Keokuk Co.—The winter wheat here is all killed by the continued freezing and thawing. Neither the chinch bug nor Hessian fly has injured the crop at all. Taking the county through, there will not be enough winter wheat to yield half the seed that was sown last fall. Compared with last year the wheat crop will be a failure. W. T. D.

RUTLAND, Humboldt Co.—No winter wheat raised in this section—all spring wheat. A larger acreage will be sown this year than last. None sown yet; but will be this week. Weather fine with freezing nights. W. H. S.

Timber Creek, Marshall Co.—Some farmers here sowed from two to ten acres of winter wheat merely as an experiment—Mediterranean is in good condition, all other varieties are winter-killed. W. B. W.

VAN BUREN, Jackson Co.—The wheat crop is about all killed by the winter; most of it will be plowed up. A large breadth was sowed. Loss great. Red clover badly damaged also. E. O.

VERNON, Van Buren Co.—The winter has been unfavorable for wheat here; probably one-fourth of it has been killed. It does not seem to be injured by the fly. Its general appearance, compared with last year, is unfavorable. The acreage is 20 per cent. greater than last year. The weather now is very unfavorable and the prospect poor. L. C.

VILLISCA, Montgomery Co.—Wheat is badly winter-killed here. No disease or Hessian fly. Its appearance, compared with other years, is unfavorable. There is an increase of acreage of at least 75 per cent., very little having been sown in former years. J. H. VAN V.

WEBSTER, Keokuk Co.—Winter wheat is three-fourths winter-killed. No Hessian fly. The acreage sown last fall was fully four times the usual amount. Of spring wheat the usual acreage will be sown. Weather unusually mild for the time of the year. J. W. B.

Missouri.

CARTHAGE, Jasper Co.—The wheat in this county is better this year than it has been for many in this immediate past. The winter has been open and free from frost, and it has grown all through the season. It does not appear to have been injured by the Hessian fly, and the acreage is the largest ever raised. The same is true of adjoining counties. W. H. P.

CENTER VIEW, Johnson Co.—The wheat crop is very promising; the winter did little damage to it; no damage done by the Hessian fly. There never was a better prospect than at present. The largest acreage ever sowed in this part of Missouri. J. R.

CHARLESTON, Miss. Co.—Wheat in this county looks fine; the warm, open winter, with but few light freezes, did not check its growth. So far no disease of any kind has been visible; and so far as I can learn, the Hessian fly is, like the chinch bug, a failure in this locality. The acreage is larger the present year than in any previous one. M. V. R.

COLUMBIA, Boone Co.—Wheat is in good condition; not much injured by winter—less than usual. It shows no disease. No signs of of the fly. Much more has been sown than usual, and the soil was better prepared. So far our crop promises better than for many years. G. C. S.

FULTON, Callaway Co.—A large acreage of wheat has sown in this county. The early-sown is good except that it has been slightly affected by late frosts; the late-sown is damaged considerably by the recent freezings and thawings. No perceptible injury from the Hessian fly. On the whole, the prospect for the crop is good. H. C. McC.

HAMILTON, Caldwell Co.—In this section of the country farmers put in about the usual acreage of winter wheat. It was sown very late on account of the fore part of last fall having been very wet, but, in spite of everything, it looks well now. F. S.

HERMITAGE, Hickory Co.—The condition of wheat in this county is about as follows:—The winter has been quite unfavorable—too much drought—and in many cases the wheat is turning yellow. No signs of disease otherwise. The Hessian fly has injured the crop to some extent, say 20 per cent. Its general appearance is about 75 per cent. of an average of other years. The acreage is about 25 per cent. more than formerly. The winter has been open, with no snow or freezing weather. M. N. N.

KIDDER, Caldwell Co.—The wheat crop here has been badly injured by the winter. It shows no signs, however, of damage by disease or the Hessian fly; yet its general appearance is worse than in other years. The acreage under it is less than last year. C. R.

MACON CITY, Macon Co.—This has never been considered a wheat county. It fails of good results four years out of five, but the remarkable success of last year induced the farmers to sow last fall one-third more than usual. The winter has been very mild and open, but the wheat looks well and very promising. A few fields look patchy, and now it is warm and dry, and we fear more on this account than anything else. There is no indication of disease and the Hessian fly never troubles us. The chinch bug has harmed the crop in former years, and may this; but in the

light of present indications we shall probably have a good yield. O. A. S. M.

MIRABILE, Caldwell Co.—Wheat in this section is very poor. The winter has been very hard on it, there being no snow to protect it. It shows no signs of disease. The Hessian fly has not harmed it. There has never been any insect here that injures wheat except the chinch bug. The general appearance compares unfavorably with that of other years, and the acreage is a great deal larger. H. W. A.

NEOSHO, Newton Co.—Wheat never looked better. No appearance of fly or other injury. It has grown all winter, affording good pasturage for calves and other light stock. The acreage is about an average for southwest Missouri. We have had a very mild winter, no ice forming sufficient for storing. The fruit prospects are good. The peach blooms are beginning to show the red. Corn, 30c. ₰ bushel; wheat, 90c. Raising hogs and cattle is our best business. M. T. R.

ROCKVILLE, Bates Co.—The number of acres of wheat sown is one-fourth or one-third less than usual. Farmers were afraid of the chinch bug. The fly was in the wheat "some" last fall, but it looked well until the last of February, when we had a freeze that injured it. It does not look as well as usual at this time of year, though it may come out very well yet. J. N. C.

SEDALIA, Pettis Co.—The condition of wheat in this section is good. The winter has been favorable to it. No disease at all. No Hessian fly. I think wheat never looked better at this time of the year, though it is rather small, owing to late sowing. The acreage is larger here than usual. C. C. C.

ST. JOSEPH, Buchanan Co.—Wheat very much injured by dry weather, hardly any rain since November. No sign of any disease or harm from the Hessian fly. The general appearance is worse than for the last six years, the acreage being a little larger than formerly T. B. N.

ST. PETER'S, St. Charles Co.—Fall-sown wheat has suffered little from the winter hereabouts. There are no signs of disease in it. The fly injured only that which was neglected. Its appearance is about the same as at this season in former years. The acreage is about 10 per cent. more than last year. G. G.

TIPTON, Moniteau Co.—We had an open winter till the 12th of March. Early-sowed wheat looks well, late-sowed not so well. In some parts complaints have been made of the Hessian fly. The general appearance is much better now than for many years, and one-fourth more was sowed than last year. If chinch bugs don't trouble us we have a nice prospect for a good crop. D. S.

Kansas.

ALTOONA, Wilson Co.—Wheat shows no signs of disease, nor does it seem to have been damaged by the fly. It looks a little better than usual, and a larger acreage has been sown than ever before. J. H. G.

CLAY CENTER, Clay Co.—We never had better prospects for a good crop. The acreage under fall wheat is about twice as large as ever before. A. B. D.

CHANUTE, Neosho Co.—The prospect here for a large crop of fall-sown wheat, is good. It has not been injured to any extent by the fly, and looks fine at present. More has been sown than ever before. The best time for sowing is from Sept. 15 to Oct. 1. Weather warm and fine for spring work. Oats about all in. W. A. R.

Ellis, Ellis Co.—Much of the wheat in this section was sown late, and it was so dry last fall that it is not up yet; but it is alive, and if we get rain soon I think it will come on all right. No Hessian fly or disease. Acreage under fall wheat larger than heretofore. J. B.

FONTANA, Miami Co.—Wheat looks fine at present; 20 per cent. more was raised than last year and it is 20 per cent. better in this county and also in Johnson county, as far south as I can hear. The fly was in some early-sown places, but we can't tell what it will do this spring. W. P.

HEPLER, Crawford Co.—The winter did not affect the wheat in this section until the last six weeks which have been dry and cold, making it turn rather yellow. There is no sign of disease or of the Hessian fly. The general appearance compared with other years, is rather above the average. The acreage is greater—at least one-third. About ten inches of snow fell on the night of the eleventh of March, which, I fear, has killed the peaches as the buds were very much swollen. A. C.

IOLA, Allen Co.—Wheat was looking splendid until the last cold snap, which has injured it in some places nearly one-third. No disease. No Hessian fly or other injurious insects. The appearance at present is not on an average with that in other years at this time. The acreage is about 50 per cent. larger than in previous years. H. M. S.

LAWRENCE, Douglas Co.—Wheat, most of it looks well; some that was sown broadcast was injured somewhat by the winter. It is mostly drilled, and this looks better than usual. Perhaps 25 per cent. more acreage than heretofore. Not much of it injured by fly. J. P.

MCPHERSON CITY, McPherson Co.—The wheat does not appear to be killed to any extent. There is no Hessian fly here. Its general appearance is not so good as in last March. It is a little too dry. The acreage is about the same as last year. C. D. R.

MEDIA, Douglas Co.—Wheat is looking very well in this section, though the winter has been a little dry for it. The acreage is fully as large as, and probably larger, than in any former year. H. A.

Newton, Harvy Co.—There was a larger acreage sown to wheat last fall than usual, and it looked first-rate until March. Since then we have had some hard freezing and the ground has been very dry so that some pieces have been injured; but, as a general thing, it looks well. We had a little rain on March 24th, which revived the crop considerably and it is growing very fast. No Hessian fly or any other pests. It looks much better than last spring. A little more rain would help it still more. S. O. G.

PAOLA, Miami Co.—Wheat in this section is looking remarkably well; it was not winter-bitten, and shows no signs of disease; have heard no complaint of the Hessian fly. Acreage a great deal larger than ever before. On the whole, the prospect now bids fair for an unusually large harvest. The winter was very mild and pleasant; very little storm of any kind. E. L. W.

Pavillion, Waubansee Co.—The acreage under winter wheat in this county is fully 20 per cent. greater than last year, and the crop is at least 25 per cent. better in condition. Although the weather is somewhat dry, wheat in this and the adjoining counties is very promising. No disease or insect enemies. During the late cold snap when the mercury went four degrees below zero, peach buds were badly hurt but not all killed—other fruits are all right. H. A. S.

SHAWNEE MISSION, Johnson Co.—The winter has improved the wheat a little on the north slopes of the hills. It is healthy, however. I think it is free from the fly; its appearance is better than usual. The acreage is at least one-eighth larger than last year. J. G. M.

SUMMERVILLE, Ottawa Co.—Very late-sown wheat is winter-killed; early-sown, all right. No disease, but it is being injured by a long-continued drought. No Hessian fly. Its general appearance about an average. The acreage is larger by 25 per cent. or more. J. R. S.

Wichita, Sedgwick Co.—Wheat has gone through the winter in fair condition. A breeze on the 14th or 15th of March put it back somewhat, but a warm rain soon will prevent any great injury. No disease or Hessian fly here. General appearance far better than last year. J. E. C.

Wilson, Ellsworth Co.—This part of Kansas being an entirely new farming country and very good for wheat, the acreage in fall wheat is fully double that of last year. There is some increase in spring wheat, too. The Hessian fly and weevil are unknown. Fall wheat has been greatly hurt all around us—1st by drought; 2nd by the late cold snap on March 12-13. It might have been a total failure if the ground had been wet, but since Nov. 13-14, we have had hardly any rains and only a few inches of dry-looking snow. We have had frost every night since the middle of January; but if rains and warmer weather will soon favor us, we are in hopes of raising an average of 15 to 20 bush per acre. Spring wheat just coming up—mostly all Odessa which is turning out very well on the average. We have a great wheat country here, and corn etc., are doing well also. J. M.

Nebraska.

BROWNSVILLE, Nemaha Co.—Winter wheat, owing to too much drought last fall, did not come through the winter in good condition. Much has already been plowed up, and spring wheat sown in its place. No signs of the Hessian fly heard of. The comparative condition with other years at this stage of growth, is inferior, and the acreage small. All Jan. and Feb. were exceedingly pleasant. March has been cold and unpleasant—more snow and real winter than altogether during the preceding winter months. R. W. F.

CHARLESTON, Gage Co.—Wheat has wintered finely, except shallow and late sowings. Poorly farmed pieces are winter-killed. Generally the crop is good. No disease appears to affect it and we have neither seen nor heard of any Hessian fly. The acreage sown is much larger than ever before in this vicinity. H. A.

BEATRICE, Gage Co.—The wheat crop around here passed through the winter very well. The ground was frozen most of the time. Wheat drilled in is all right; broadcasted suffered somewhat. No Hessian fly but some chinch bugs last summer. Compared with other years, the appearance is good. Acreage one-half larger than usual. Spring wheat is more generally grown, but of late years it has not been a sure crop. The past winter was dry. Roads good; immigration increasing; stock has done well and pays better than raising grain. R. S. B.

COLUMBUS, Platte Co.—There is no winter wheat grown in this section. But very little spring put in yet; but there will be a much larger acreage sown than usual if the weather will permit. March has not been looking anything like spring. Six to eight inches of snow have fallen during the past two weeks and on the 14th the thermometer stood 20 deg. below zero. J. A. MC G.

PAPILLION, Sarpy Co.—There is but little winter wheat sown in this section, but what there is has done well so far, although the winter has been very open, and the weather changeable and but little snow. There will be a large crop of spring wheat sown. No disease or any signs of Hessian fly. Farmers are putting in spring wheat. A good many are going West through this county for homesteads. E. E. S.

PLATTSMOUTH, Cass Co.—I left Buchanan county, Iowa, about a month ago. Winter wheat which was sown extensively there was all killed. Here, too, wheat was all killed except that which was plowed in, which will make a fair stand. In this county there are about 3,000 acres, perhaps a third more than last year. P. M.

RESCUE, Saunders Co.—There is no winter wheat sown here; but there will be considerable spring wheat sown—more than last year. Farmers have commenced sowing already, some having put in nearly 100 acres. C. R.

Dakota Territory.

ROCKPORT, Hanson Co.—The only winter wheat raised in this section, is that put in as an experiment. Sometimes all this is winter-killed—a fate that has happened to all sown last fall that I have heard of. It sometimes yields 26 bushels to the acre, however. No Hessian fly in this section. D. J.

Colorado.

SEDALIA, Douglas Co.—Very little wheat was put in in our section last fall, and what was put in is very backward on account of the very dry winter. As far as I can tell, it has not been harmed by the fly. No disease was ever known to harm wheat in Colorado. The acreage is smaller that in other years. R. G. C.

AWADA, Jefferson Co.—We raise no winter wheat in this section, and, owing to the lack of snow or rain, we are this year much behindhand with our crops. It is doubtful if the acreage this year will be as large or the yield per acre as great as last year. There is very little plowing done, and there is no sign of storms yet. C. H. D.

GOLDEN, Jefferson Co.—Very little winter wheat is sown in this State, and very little spring wheat has been sown yet, owing to our dry winter and spring. Unless we have storms soon, the crop will be short—perhaps almost a failure. Land is too dry to plow and too dry to sprout grain. T. W.

GRANITE, Chaffee Co.—This is a mining country—no wheat is raised, or any crop of any kind except hay. The altitude is 9,800 feet at my ranch at the foot of Mt. Elbert. Hay costs $60 a ton at my home market, Leadville, so that hay raising and harvesting are of paramount importance to me, as it "pays" to produce and save even a little more of the crop. F. E. H.

California.

SALINAS, Monterey Co.—The wheat here has been considerably affected by the frosts which have been unusually severe for this section. Some few portions have also been injured by the worm (so called)—I think a kind of wire-worm. No Hessian fly. Its general appearance, taking the whole valley, is very good, but backward on account of the cold weather. Starting from a point eight or nine miles south of the city of Salinas, and going in that direction up the valley, its condition is superior at present to the crops in the immediate vicinity of the town, owing to their having a greater amount of rain. The acreage of wheat is much greater this season than last. F. G.

SOUTHERN STATES.

Virginia.

FREDERICK Co., Va.—I was at my place in Frederick county, Virginia, last week and through parts of the county. The wheat has stood the winter well; no signs of disease—not harmed by the Hessian fly. Its general appearance compared favorably with that during the past three or four years. For the last three years the crops have been remarkably good and the promise for the coming harvest is equally flattering. The acreage this year somewhat exceeds that for the past several years. Around Baltimore the wheat looks well, is forward and apparently free from disease. S. H. W.

Kentucky.

BOWLING GREEN, Warren Co.—Wheat is looking more promising than I ever saw it before. I do not think the past winter, however, was very favorable, for it was too warm and wet. There has been so much rain that in places, it looks yellow, or "scalded." Hundreds of acres in this county are now covered with water, which will be a loss of hundreds of dollars. I hear no complaint of the Hessian fly. Acreage from one-third to one-half larger than ever before. J. D. S.

CARLISLE, Nichols Co.—Wheat generally looks very bad—thin and spindling. The winter has not injured it in the least. The Hessian fly did considerable damage to most of the early-sown wheat, though there are a few scattering fields that look very rank. I do not think the wheat looks as well now as at the corresponding time last year. A larger acreage has been sown. This winter has been very mild, with rain! rain! and mud; but very little snow. C. W. H.

E. HICKMAN, Fayette Co.—The winter has been open and wheat is very forward. Farmers are grazing it with sheep and calves, fearing late frosts. It shows no signs of disease. A few early-sown pieces only show signs of injury from Hessian fly. Its general appearance is very favorable. The acreage sown is large—one-fourth more than last year. J. H.

OWENTON, Owen Co.—Wheat has come through the winter well. No signs of disease or effects of the Hessian fly. The crop is much later than during the past two years, owing to dry weather last fall. Acreage smaller than last year—perhaps 20 per cent.; but it is an average acreage, counting five years. Its general appearance is favorable rather than otherwise. J. W. W.

PIKETON, Pike Co.—Wheat in this section is in better condition than for many years. No sign of any disease, or of the fly. The acreage is larger than usual. Wheat is looking as well now as it generally does the first of May. If nothing happens to it between this and harvest, we expect a bountiful crop. M. D.

North Carolina.

COHOCTON, Steuben Co.—There has been about the same quantity of wheat sown as usual, but there has been very little snow, and it has been freezing and thawing so much, that the wheat looks yellow and bad. No Hessian fly. R. E. K.

GREENSBORO, Guilford Co.—Wheat is looking well in this county—better than for the last seven years. The quantity sowed is greater than in any year for that time. The winter was dry and warm. G. K.

HIGH POINT, Guilford Co.—Wheat is looking very good. Owing to the warm season, early-sown wheat is splendid; late-sown not so large, but no disease about it; neither has it been harmed by the Hessian fly. It looks better, as a general thing, than last spring, and more acres have been sown. J. L. F.

PAW CREEK, Mecklenburgh Co.—The past winter was not very favorable for wheat, but the spring rains have brought it out, and it looks better than usual at this time. No disease. No Hessian fly; but a new insect has destroyed a few fields. The acreage is about the same as usual. J. T. C.

SANS SOUCI, Bertie Co.—We have had an unusually mild winter. Wheat in our section, is large for the season. There is not yet any symptom of disease, nor is it damaged by the fly. At this date it is perhaps looking better than is usual for the period. The acreage though small, is larger than last season. J. C. F.

SWANNANOA, Buncombe Co.—The winter here has been very mild and the wheat is more forward than usual; at present it shows no sign of disease or injury. The appearance is much better than usual, though there is more reason to expect damage from freezing than if it were less forward. The acreage is very large, and if no injury occurs to it from now on, it is thought the crop will be the largest ever raised in the county. D. E. S.

Georgia.

GREENSBOROUGH, Greene Co.—The wheat crop is doing well; in many sections the fly has injured it. Some say the rust has appeared—though this is very early. There is a considerable increase of acreage, compared with last year. The winter has been mild and we think the main crop will be poor; late crops will probably rust. L. B. W.

MACON, Bibb Co.—We have had an extraordinary winter: very few frosts, and ice only twice, also very little rain, comparatively, causing wheat to have a bad appearance. I do not know whether to attribute its bad condition to the ravages of the fly or to rust, from the effects of the dry winter. The prospect for a good crop up to a few days ago was not good; since then, however, abundant rains have fallen and

may make a great difference in the result. It certainly looks improved. A much larger acreage than in any previous year. H. J. P.

Alabama.

HUNTSVILLE, Madison Co.—There has been a good deal of wheat sown this year, and it is looking better than usual—farther advanced. There has been no sign of disease, and as to the Hessian fly, I have heard nothing of it. The winter has been very mild. We have had a great deal of rain this month. P. H. M.

MAYSVILLE, Madison Co.—The prospect of wheat in our section is good. It does not show any sign of disease. We have had no fly. It compares very favorably with former years. The acreage is a little larger than usual. F. J.

NEW MARKET, Madison Co.—The winter has not affected the wheat crop here unfavorably. On high land there are some signs of disease in it; but not on bottoms. The same is the case with regard to the fly. On the whole its general appearance is much better than in former years. It is now in joint in some spots. Farmers would have plowed it up for oats, but the rains fortunately prevented them; and now the ground is covered with a bold, healthy growth. About five per cent. more has been sown than last year. We look for a fine yield. G. D.

SAND SPRING, Limestone Co.—Wheat here is looking fine, especially that put in by Northern farmers, as they generally take more pains to prepare the ground for it. I have a six-acre field, of which a Southerner told me he never saw better-looking wheat at this time of the year. The acreage is larger than usual, and I hear but little complaint of its being winter-killed, No Hessian fly so far as I hear, except in southern Tennessee. The Blount County News of this week says: "There is an extraordinarily large breadth of land in wheat between Blountsville and Guntersville, and it is looking remarkably well." W. M.

TALLASSEE, Elmore Co.—Our winter season thus far has been unusually mild. I hear very good reports of wheat among our farmers through this section of the country; some, though, are reporting rust, which I hardly believe to be true as 'tis too early yet. The crop is generally considered better than last year at the same time. The acreage of all kinds of grain is more than last season—especially so with oats. Farmers are trying to help out the short corn crop of last season in this way. W. E. S.

Arkansas.

GREENWOOD, Sebastian Co.—During this month we have had numerous showers which have impeded farm work to such an extent that farmers did not plant corn as early as last season. Therefore, the season here will be about one month later than usual. However, we keep busy at building fences and plowing. Early potatoes, peas, lettuce and onions are up and growing finely. Some of the earlier sorts of peaches "have gone where the woodbine twineth," on account of frost. Working in this dry, sandy soil is much nicer and pleasanter than toiling in the mud, as we used to do in our former Northern homes. No cleaning stables here and but very little feeding of stock. R. R.

Texas.

BROOKSTON, Lamar Co.—The wheat crop in this section looks fine—better than it has for several years. I have not heard of any damage from the Hessian fly. The winter has been very favorable for wheat and oats. The acreage is smaller than heretofore. Last fall was so very dry that but few farmers sowed wheat. W. J. N.

WACO, McLennan Co.—The condition of wheat throughout this section is better than it has been in any previous season. The winter has been unusually favorable—plenty of rain and growing weather. On the 13th of March we had a severe freeze, but the opinion prevails that the wheat has been benefited by it, rather than injured. There are no signs of disease, and no report of the Hessian fly from any source. The acreage is larger than ever before, and the prospects at present indicate that we shall have an abundant harvest of wheat. A. S. S.

HUTTO, Williamson Co.—In this vicinity the prospects for wheat and oats were never better. The stand is unusually good and not less than twice the usual acreage has been planted. No indications of disease or Hessian fly. The late freeze injured corn and potatoes and killed most garden vegetables and early, forward fruit. E. E. S.

DALLAS, Dallas Co.—The winter has not injured the wheat here; but on March 14th a heavy frost cut it badly, though the people think it is not much hurt after all. Before that, some parts were showing signs of rust. No insects have hurt it as yet. The general appearance compares favorably with other years, in spite of the late frost. The acreage sown is much larger than usual. J. R.

Canada.

INGERSOLL, Ont.—The winter has not hurt the fall-sown wheat much hereabouts. That sown from Aug. 25 to Sept. 5 shows signs of having been injured somewhat by the fly. Its general appearance, however, is fully up to that of other years, while the acreage is larger by ten per cent. Wheat sown on heavy clay land is badly winter-killed. Clover is badly injured by the winter. J. J. MC'L.

Pelham, Welland Co., Ont.—Wheat has wintered well—better than usual. No signs of disease or of the work of the Hessian fly. The present prospects are better than usual. The acreage has increased about 12½ per cent. B. B.

SOUTH DUMFRIES, Brant Co., Ont.—The fall wheat has very seldom looked so well at this time of the year. It showed some yellow spots early last fall, but towards winter it improved in color, and had a fine appearance when winter set in, and has stood the winter well except some on wet clay land that has been hurt somewhat. I think there is about an average quantity of ground under wheat, and it looks now as if it might be above an average crop. We are getting pretty sharp frosts now, that might harm it yet. R. R.

ST. GEORGE, Ont.—Wheat in this section has not been harmed to any great extent by the winter, except in low, undrained places. There is no appearance of any disease. Early-sown wheat is slightly injured in spots by the fly. Its appearance is nearly as good as last year. Acreage larger. About one-fifth of the land here was sown to wheat. A. C. H,

(Continued on page 237,)

Dairy Husbandry.

FEEDING COWS FOR MILK.

IN the RURAL of Jan. 10th, in Henry Stewart's article on "Winter Butter Making," I notice several points that are not quite satisfactory. When there is so much of real value one cannot afford to be without a full and complete solution of so important a subject, especially if it is known to be in the possession of the author, and that its absence is due to a mere inadvertence in not communicating it. Then let me ask, What was the live weight and condition of the cows? What was the proportion of corn, oats and wheat bran? Was it equal parts by measure or by weight? Was hay given to the cows in addition to the feed specified? If so, how much? Was it cut and wet and the meal mixed with it; or given dry without cutting? Again he says, in mentioning the rations preferred, "wheat bran or middlings." Does he put the same value upon wheat bran that he does upon middlings? Is bran that is obtained by the new process of brushing or separating all the flour and middlings from the bran, as valuable as that formerly obtained? How many pounds of cut hay would he feed per day? How many pounds of dry hay to equal a peck of roots?

Professor Atwater gives the following food properties as laid down by Dr. Wolff of Germany as being contained in 100 pounds, equal parts by weight, of corn, oats, wheat bran; with 4.30 of entire amount of cotton-seedmeal:—water, 13.1; ash, 4.2. Total organic substance, albuminoids, 13.5; fiber, 13.2; other carbohydrates, 50.2; fat, 5.7. In this estimate I have taken corn, oats and cotton-seed cake in place of the meals, as they do not occur in the table, and have been sufficiently accurate for all practical purposes.

Now, with oat meal at $1.25 per hundred and no cotton seed meal in our home market; with corn meal at 80 cents per bushel and wheat bran at 60, will it pay to add them to our feed? In this wheat-growing region nearly as much can be obtained for the flour as for the unground wheat, and the coarse feed and the thousands of tons of straw that now rot in the fields or are ofttimes set on fire to get the stuff out of the way, could be made to return a handsome income both in their feeding and manurial disposal. C. H. ELLIS.

Hillsdale Co., Mich.

Remarks by Henry Stewart.

In this special case it is immaterial to specify the points referred to, as the information given simply shows the effects produced by feeding a certain quantity of palm-nut meal and cotton-seed meal. But as it may be of interest to some, I give the particulars desired, more especially as I have been feeding cows for years, making a large number of tests of different kinds of feeding substances and have finally settled down to a mixture of corn, oats and wheat bran *ground together*—not merely mixed—in equal parts by weight, as the best and most profitable food for cows, either for milk or butter, and on 10 pounds per day as the ration that can be most economically employed. The bran used is the common commercial sort usually procured in the market, and which has been cleanly scoured of all particles of flour or middlings. It is difficult to procure any other kind except at custom mills in country places; the merchant mills clean the bran much more closely than other mills. I don't care how closely the bran is cleaned, the phosphates are in it anyhow, and it is for these I use it. The cow Minnie is a large cow, eight years old, of native or mixed stock, and weighs 1,100 pounds; at the time referred to she was fresh or nearly so. Bolivia is an imported Ayrshire in her third year, and had been milking ten months at the time and was in calf two months. Her weight is 450 pounds. Although so small, she will eat profitably as much meal as a larger cow, returning as much milk and butter as two or three larger cows together. She has milked over 8,000 pounds from Feb. 13th, 1879, to Feb. 13th, 1880. The hay given these cows varies from 12 to 18 pounds, as much being given as they will eat and lick the manger. The hay is cut, wetted, and the meal is mixed with it. This cut feed is given morning and night, and at noon a peck of cut mangels and a pound or two of dry hay.

I estimate scoured bran to be equal to middlings, weight for weight; but if I were using middlings, I would reduce the oats one-half and increase the middlings in proportion. While I give a good deal of credit to Prof. Atwater for his valuable work in the direction referred to, yet I look upon these theoretical investigations as only of partial value, as furnishing a basis upon which one may experiment practically—something as though one should stand on the shore and tell a fisherman where to drop his net to catch fish, so these analytical investigations tell us in what direction to work to secure the most valuable results in the easiest and most direct manner. After all, it is in the stable, and with the milk-pail and churn, that one can best investigate the values of food, and, besides, people must do it, each for himself; for the reason that this man's circumstances, being different from that man's, whatever the one does serves only to point the direction in which the other may follow, but it does not do his work for him.

The Herdsman.

STOCK NOTES.

CLUBBING FOR IMPROVED MALE STOCK.—The very best of these might be had if farmers would only unite to procure them; and the service from each would be a mere trifle in comparison with the great benefit derived from their use. Male swine and sheep, even of choice breeds, are so cheap now that nearly every farmer can afford to keep one of his own; but when it comes to bulls and stallions, choice ones are so high-priced, as to make it necessary to form a club for their purchase, as they are beyond the means of most single farmers. Colts and calves, even out of indifferent females, got by superior stallions and bulls, are usually worth twice to thrice the amount of those bred when both sire and dam are indifferent. The cost of feed for rearing a good animal is no more, and often less, than that for a poor one, and if when ready for market, the former brings twice or thrice the price of the latter, it is a matter of great congratulation to the farmer—to his pride as well as to his pocket. Be careful that all stallions are not only of fine form and action, but kind-tempered and perfectly sound.

HEREFORD MUNCHAUSENISM.—An English paper, wiser than those of America, informs us that 400 young Hereford bulls have been lately purchased in Canada and the United States to go into the herd of one of our great Western cattle kings. This will do very well for a Munchausen report. We don't believe that 400 Hereford bulls of all ages can be found in America, to say nothing of young ones alone. Perhaps the above, if indeed they were purchased at all, were grade animals, which is quite another thing from pure, well-bred Herefords.

Field Crops.

DIFFERENCE IN THE VALUE OF ROOTS—RELATION OF SOIL AND CLIMATE.

COL. F. D. CURTIS.

WE have shown that roots form a feeding value beyond that given to them by chemical analysis, according to the various published tables. We do not deny that the chemist can determine the component parts of roots, so that it may be known, approximately at least, what those parts are, but our point is, that the variations are so great in the quality or character of the roots, that the tables are not to be relied upon as a certain guide to the farmer in estimating the worth of roots for animal food. No doubt many farmers have been deterred from growing roots on account of the small percentage of fat or flesh-forming material they are stated to contain; when, as a fact, they contained much more. An analysis of sugar beets, made from those grown on the rich black soil of the prairie States, although it would cover a large region of country, would not be a true analysis for the component parts of beets grown in New York, in New England, or in other sections of the country. An analysis of the beets grown in California would not determine the sugar value or the feeding value of beets grown in Maine. In the latter State they may be profitably manufactured into sugar, while in the former State it is still an undemonstrated question, owing to the large percentage of earthy salts contained in them.

In Illinois and the other States of similar soil, they lack in sugar, and this important constituent is so small that the working up of beets for sugar will not pay. Notwithstanding this fact, it would no doubt pay the farmer well to grow both beets and mangels to feed his animals. If they had done this in all of the country where hog cholera has made such fearful ravages, and fed raw roots to their hogs with the corn, no doubt there would have been much less of this disease, which is caused by a perpetual diet on corn more than by anything else. In some soils the "impurities," in the juice of beets, which are made up of earthy salts, saltpeter, soda, potash, lime, phosphoric acid, etc., more than equal the amount of sugar. Such beets would make a poor showing for manufacturing into sugar, but would be valuable only for animal food in connection with such heating and stimulating material as corn which cannot be fed to excess, or for any great length of time to any animal without filling the system with fever and inflammation. There is a limit in feeding corn to any animal, beyond which it is not healthy. Farmers all understand this fact that the beef animal must not be fed too much, or too long, and that the pigs must be turned off as soon as they get fat, or a reaction will take place and they will get poor again. Not so with roots, as they contain ample juices and material both for flesh, bone and fat, combined in a natural and digestible form. Beets are richer in sugar when grown in soil in which there is not an excessive preponderance of vegetable matter. This is the trouble in the prairie States. In California there is too much alkali.

These are the extremes, but in both of these sections roots are valuable as food. In the Eastern and Middle States there is a more perfect combination of mineral and vegetable matter in the soil, and here beets will grow to the greatest perfection. A loamy soil is preferable, as this contains the elements required to the largest degree. On such land the percentage of sugar has been found to be, in sugar beets, as high as fifteen to eighteen per cent. On Kirby Homestead, N. Y., it was last year 15.60 per cent. The soil is clayey loam and has been cropped with roots of various kinds for several years. The true value, or adaptation of land for roots, will undoubtedly vary in the same locality. This has been found to be the case in Europe; as one factory not widely separated from another can produce a better quality of sugar, that is, freer from impurities. In the State of Delaware the highest percentages of sugar have been found thus far. The manures applied also affect the character of the roots. There should be a combination of manures, with that from the barn-yard as the base.

A slight sprinkle, about 100 pounds to the acre, of Manhattan blood guano, or a similar fertilizer, is valuable to be put into the drill with the seed. Hen manure and plaster (sulphate of lime) are a good substitute. In any case plaster should be sown on the tops of the plants when they are growing. Experience has demonstrated that the teachings of the chemist in regard to the analysis of the soil in connection with the growing of crops, cannot be relied upon with certainty, in fact, that there is very little practical value in their analyses, and it is somewhat so in using special manures for special crops. The soil has such a transforming effect upon manures, and also the influences of the sun and rains are so great that in our judgment there can be no certainty in these crop prescriptions; hence manures of general character are better to be relied upon than any specific doses. The larger the root, the less percentage of sugar according to bulk. A small beet, then, is not to be despised.

Sandy land, well manured, would grow beets rich in sugar, but sandy loam, or gravelly loam would be better; a stiff clay is the least desirable. A dry season restricts the growth, and concentrates the richness of the roots and a moist season expands it into a more bulky form with a larger percentage of water and woody fiber. Swedes in their growth and quality are not so sensitive as the beet family; hence they are better adapted to various soils and climates. As their chief virtue is in their sugar, the same laws and conditions apply to them as to beets, but not in such a particular degree. As a universal crop they are, therefore, to be commended. There is no better guide in root culture than demonstration. We have fully demonstrated in our own case their practical value for food and cheapness. The best way is for others to do the same, in a small way at first, perhaps, but to do it thoroughly and fully.

Scientific and Useful.

METEOROLOGY AND AGRICULTURE.

Perhaps our most progressive agriculturists have neglected to give such attention to the labors of our Signal Service as it demands. No doubt many have dismissed it with the idea that it relates, practically, only to commerce; but to no class is a study of the atmosphere of greater utility than to farmers. They are subject constantly to the effects of changes in the atmosphere, and as its phenomena must be governed by law, who can have more to gain by a methodical study of these phenomena? Some farmers of close observation, before the present facilities were offered them, formed for themselves a system of signs, as they called them, which came very near to the future moods of the weather. These early observations must have extended over a very limited area. But now the thoughtful agriculturist may have at his hand extensive scientific observations made daily over vast areas, which he may compare with those of his own locality. The instruments by which these observations are made are much more accurate than could be obtained even 25 years ago. Our Government has achieved a world-wide distinction by its immense system of observations made at more than 200 stations within the territory of the United States, having exchanges with the stations and chief meteorologists of the Northern Hemisphere. The reports of the Chief Signal Officer contain the meteorological work of the world. All this wealth of material and data from which to study the moods of the weather is within reach of intelligent farmers. Our Signal Service is performing a work more extensive, more thorough and reliable than is produced by the aggregate observations of the meteorologists of all the world besides.

This work could not have been done by individual enterprise, nor could it be done as thoroughly by the Government through civilians as agents. Military discipline seems necessary to the regularity and certainty of such work.

But we commenced this notice with a view of calling attention to a particular feature of these Signal Service reports which does not seem to have been properly appreciated. Our immense territory, having such a variety of climate and productions, has been a puzzle even to our own citizens. Information is eagerly sought from those who have even traveled through these wide spaces, trying to learn something of climate and productions. But the signal stations, located at various points across this wide belt between the Atlantic and Pacific Oceans, give the most reliable information. These give a scientific and most accurate statement of all the facts necessary to determine the climate of this vast territory. Each station gives you the latitude and longitude, the temperature, barometric pressure and humidity of the atmosphere, elevation above sea level, force and direction of the wind, and the rainfall of every day in the year. Here is a body of information which, when studied, gives the most complete knowledge of atmospheric changes and a better insight into the climate than could be obtained from the recollection of an intelligent resident for years. This information now extends, at many stations, over a period of five to ten years.

These annual reports of the Chief Signal Officer are of very great service to the agricultural editor, who requires just the information here given to adapt his instructions to such widely varying conditions of climate and surroundings. His readers are scattered across the continent, and the aptness of instruction must depend largely on understanding the climatic conditions. These reports are so definite in their information that the expert may read the agricultural situation by them more fully than by any mere temporary survey in person.

They must also become more and more valuable year by year, and the press should urge upon Congress the necessity of giving the Service a liberal support. Gen. Myer, the Chief of the Service, is fully appreciated by foreign scientists, as their very cordial reception of him has testified. Let us hope that our Government will give him the means of greatly enlarging the usefulness of the service.

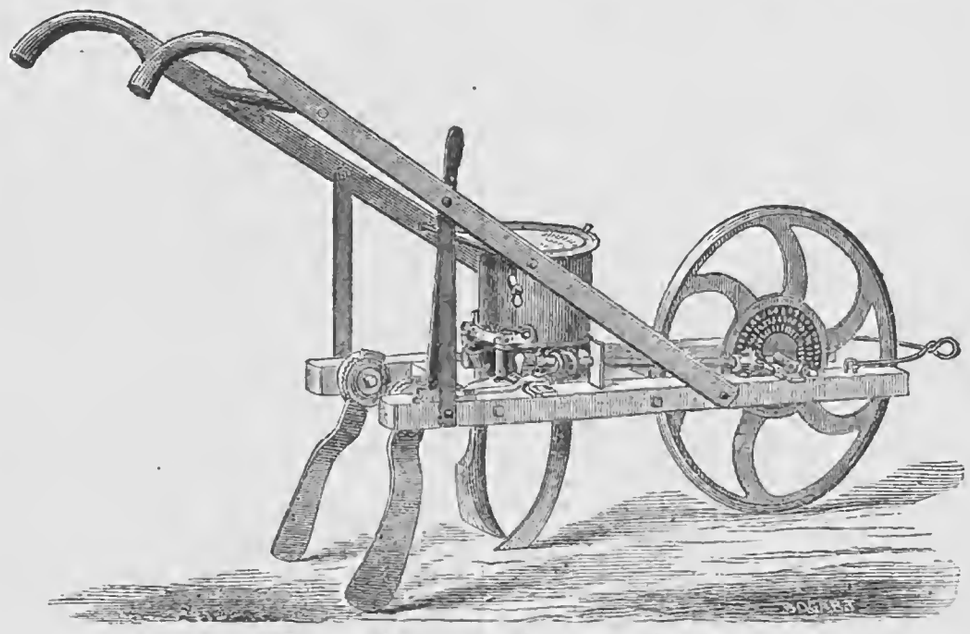
Miscellaneous.

WHAT OTHERS SAY.

Gen. Le Duc and Congressmen.—"In the stand I have taken," remarked Gen. Le Duc, Commissioner of Agriculture, before the Elmira Farmers' Club, "I have incurred the enmity of certain members of Congress, and they make it pretty lively for me sometimes. I found upon assuming my duties that the organic law of the Department read, 'the Commissioner of Agriculture shall purchase new and valuable seeds and shall distribute them among agriculturists.' This law admits of but one construction, and——"

Col. Piollet—"And there were no agriculturists in Congress." (Laughter.)

Commissioner—"But few, if any. I then decided that the Government seed store should pull down its sign and hang up its shutters, and, in the future, we would try and make it a Department more worthy of its name. I addressed a letter to each member of Congress calling his attention to this law, and asking him to furnish me with the names of the prominent agriculturists of his own district. I had no care whether they were Democrats or Republicans, white or black, rich or poor, so long as they were those upon whom I could rely for intelligent service and report? So far as I know, not a single answer was returned to this circular. Then I said to myself, all right, there is an organization called the Grange. (Applause.) Its members should know something about this matter. So I sent letters as nearly as I could to the different Granges, for no one at that time had a list of them. I made out to find them through my correspondents, whom I asked for a list of those in each county, and to-day I have a list giving me the names of the master and secretary of every live Grange in the United States. (Applause; cries of "Good! Good!"). I doubt if any other person has such a list."



THE HOOSIER CORN DRILL.—FIG. 110.

Farm Schools for Girls.—France has agricultural schools for girls. One of the chief is near Rouen, which is said to have been begun with a capital of one franc, by a Sister of Charity and two little discharged prisoner girls, and to be now worth 160,000 dollars. The establishment has now 300 girls from six to eighteen. The farm, entirely cultivated by them, is over 400 acres in extent. Twenty-five Sisters form the staff of teachers. More than one medal of the French Agricultural Society has been awarded to this establishment at Darnetel, and the pupils are in great demand all over Normandy on account of their skill. They go out as stewards, gardeners, farm managers, dairy women and laundresses. Each girl has, on leaving, an outfit and a small sum of money, earned in spare hours. If they want a home, they can always return to Darnetel, which they are taught to regard as home.—London Farmer.

Healthy Pigs.—Mr. J. J. Mechi, the English farmer who never fails to tell the farm journals of his country all that transpires at Tiptree Hall farm, says that he often reads with regret, but not surprise, of diseased pigs—and knows, from extensive experience, that it is avoidable. For some years he kept large numbers, until, owing to their proximity to the house, they became a nuisance to his growing family. But, although he had so many, and so closely packed, they were exceptionally healthy—and he gives reasons for their being so. He was frequently told that owing to his having so many (some 200) there would be disease, but he felt perfectly sure it would not be so, seeing the cause for disease was not present.

Pigs have a desire to huddle together, and they thus create a putrescent atmosphere, especially if on soft straw. In his case they were always on sparred wooden floors, the spars being three inches wide, with an interval between each spar, and a deep pit under them, so that the change of temperature caused by the heat of their bodies and their breathing was continually circulating and changing the atmosphere around, under and above them—there should be, of course, escape openings for the heated air in the upper part of the sty, or shed. There can thus be no stagnation of air—so fatal to man and beast. In cold weather they may be very closely packed or inclosed, as they have no woolen jacket, and have no long and strong bristles, like the hogs of cold countries.

Of course the urine falls between the spars, and the solid they generally deposit in one corner.

In hot, summer weather he was most successful in fattening hogs, without fear of fever (frequently so destructive). In a shed that would hold 40 or 50 (sparred floor, with a deep pit under it), Mr. Mechi turned on a jet, as from a fire engine, and in a few minutes they were all washed clean, and refreshed, and would rub their skins as clean as the back of his hand. A fresh lot, coming in from market dirty, were soon cleaned under a shower of 60 gallons per minute. Those who prefer putting a little straw on the boards in winter can do so—the urine will still run through, and the air circulates, which is the great desideratum.

It is lamentable to see pig mismanagement—burrowing in manure, getting heated, and then by exposure catching cold and lung disease (heaves), or fever. Pigs are gross feeders, and soon poison a non-circulating atmosphere. The laborer's pig being alone, escapes the danger of close company and consequent poisoned atmosphere.

He has fattened hundreds of cattle on sparred floors without a particle of straw or any sweeping of floors, the excreta all passing between the spars to the pit under them. He once had twelve white cattle on these spars from the time they were six months old until sold fat at two years old, and they were always clean and healthy. In fact, from calves until full-grown for the butcher, his cattle were constantly on sparred floors. They always fattened as quickly and grew as well as those on straw in covered yards, and were especially healthy.

It is worth noting that sheep on straw under cover do not get foot rot, and can do with little straw; but in open yards, exposed to rainfall, they will get bad feet unless very frequently littered. The opening between the spars may be according to the size of the animals; a quarter inch of opening would permit free circulation of air; one and a half inch is a good size for cattle.

To Raise Such Hogs as require two and three years to mature, of course, will not pay; says the Planters' Journal, and the great fault of all Southern farmers is that they trust too much to others for what they should do or see done themselves.

Oleomargarine.—English Views.—From a long editorial in the London Farmer we make the following notes: Oleomargarine or butterine, as our readers know, is an artificial butter made from animal fat. The invention is due to the ingenuity of a Frenchman, M. Mège, the of Vincennes. We have heard it said that the late Emperor Napoleon III. was greatly interested in the production of artificial butter, and gave his powerful aid towards developing such a manufacture. However, the credit of the invention belongs to the country over which he at one time ruled, and the Yankees have since been its greatest patrons. The skillful people who make wooden nutmegs have taken to manufacturing artificial butter on a large scale.

Mr. Archibald states that during the last two years the quantity of fat manufactured into oleomargarine and oleomargarine butter by the Commercial Manufacturing Company has been, on reliable authority, stated to be about 200,000 pounds per week, yielding 80,000 pounds of oil and butter. Of this about 75 per cent. or 60,000 pounds, per week was the *oil* product "oleomargarine," all of which was exported in barrels or tierces, for the most part under the name of "oleomargarine," but sometimes as "butter fat," or simply as "oil." This would give a yearly exportation by this company alone of about 3,000,000 pounds; but it is estimated that nearly an equal quantity is now being made by the outside manufacturers, so that the total quantity of oleomargarine exported from New York may be stated in round numbers as about 6,000,000 pounds annually.

French official reports declare it to be a perfectly wholesome dietetic material, and the Parisian *octroi* officials impose on it the same duties which are chargeable on ordinary butter. The New York Board of Health declare oleomargarine to be "a wholesome article of food." Whatever may be its absolute merits, it is necessary that it should be sold under its real name, and not as butter. It is manifestly injurious to the agricultural, as well as to the public interest to allow the artificial to be sold as the genuine article.

But the large demand for the article in any form must have a serious effect on the trade in genuine butter. It will continue to be sold, and dairymen have to face the fact. Good butter will always be preferred to oleomargarine. The contest is one between it and the lower kinds of butter. The lesson to be learnt is that whilst poor, badly-made butter will be at a discount, butter of the first quality will always command a high price, and dairymen should not make any other if they wish to hold their own in presence of the rival industry.

Few things, says Truth, are more insisted on both in private and theoretically than the necessity of having the courage of one's opinions. Publicly and practically nothing pays so badly. It is all very well to be courageous and high-minded, to snap one's fingers in the face of prejudice, to speak the truth in the face of superstition; doubtless this is one's bounden duty; but if so, then one must learn to be content with duty, *per se*, and courage, like virtue, must be its own reward It is useless to expect public support if one says or does things contrary to the current feeling of society. Friends in private will pat one on the back warmly enough, laud one's courage, admire one's pluck, uphold one's views, carry the torch of glorification all around one's action and not leave a square inch unilluminated; they will even make a whole lapful of pellets for future shooting, and urge one on one's grand career with all the power there is in praise, all the strength there is in sympathy. But those very people will shrink from one in public, and deny both the banner they have bowed to and the friend they have just encouraged.

CATALOGUES, ETC., RECEIVED.

Thirty-Second Annual Circular of the Invincible Vibrating Thrasher for steam and horse power, manufactured by Roberts, Throp & Co., Three Rivers, Michigan. A valuable work of 32 pages, filled with fine engravings and instructive reading matter. Our readers should send for it.

Spring Trade List of Nursery Stock, sold by Farley & Anderson, Union Springs, N. Y. This firm now offers for the first time the Dutchess Grape illustrated in the Rural of Dec. 6, 1879.

Trade Price List of Nursery Stock, for sale by A. Hance & Son, Red Bank, N. J.

Industrial Implements.

THE HOOSIER CORN DRILL.

The three main considerations in planting grain are: effective planting, economy of seed, and the production of more grain to the acre. These three objects are secured by planting with a good drill, such as that we here present to the notice of our readers, in the improved Hoosier Corn Drill, manufactured by the Hoosier Drill Co., of Richmond, Ind. The best experience is that the separate distribution of seed is as essential to the growing of large crops of corn as to the growing of large crops of cabbage.

The drill here shown drops with great regularity one grain in a place, and is so arranged that it can be adjusted to deposit them 12, 16, or 20 inches apart, to suit the requirements of various kinds of soil. It also, at the same operation, does the covering uniformly in depth, and its covering shares can be adjusted to cover deep or shallow. There is economy in its use from the fact that no thinning is necessary, and no replanting either, in case good seed is used.

The following calculation will fully demonstrate that no corn grower can afford to be without at least *one* good drill. Take, for instance, a crop of 40 acres, an increased yield of 10 bushels per acre, which is very moderate, as the increase is often 20 bushels, will make a total increase of 400 bushels over hilled corn. This at 50 cents per bushel gives a *clear* gain of $200 the *first* season, as the time and labor saved will fully pay for the drill. At only 25 cents per bushel, there is still a net gain of $100, which is a neat little sum.

The drill above referred to, has also an attachment for planting beans, peas, broom corn and sorghum, which goes with every drill free of charge. We strongly advise all who may need a corn drill to write for full particulars which will be promptly furnished by the manufacturers.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

CONDUCTED BY
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
78 Duane Street, New York.

SATURDAY, APRIL 10, 1880.

REMOVAL.

On and after May 1st of this year the Rural New-Yorker will occupy its new quarters, No. 34 Park Row, corner of Beekman Street.

According to the announcement in our Fair number of September last, our regular Plant and Seed Distribution was limited to all who should apply before the first of April this year. Our preparations were, however, so well made, that we have filled all orders received to date, substituting only one kind of the ten not originally or subsequently announced. We do not promise, however, to fill any further applications. Those who apply must take the chances. Our seeds are nearly exhausted.

In reply to a letter of ours, Dr. J. B. Lawes, of Rothamsted, England, says: "I have received your letter in regard to potato manures; but have little to say on that subject except that I do not think it will pay to use artificial manures for that crop in the States." Dr. Lawes would greatly oblige us if he would state why artificial manures would not pay for the potato crop as well as for root crops or cereals.

We take for granted that our subscribers and friends will be pleased to know that the increase in the circulation and the general prosperity of the Rural New-Yorker, several times alluded to in the earlier part of the year, have been steadily and fully maintained up to this time. As stated before, this must be ascribed in a great measure to the kind words—to the *influence* of our readers—and we beg to tender them our warmest, best thanks. There are more forcible ways of showing appreciation of a generous support than by mere words, and it is our plain duty, as it is our earnest desire, to follow them.

Much dissatisfaction has been expressed by those who purchase the Rural New-Yorker of the news stands, because they are not allowed to participate in our Plant and Seed Distributions. It is plain, however, that our distributions must have some limit and that we must have some protection against impositions. So long as we confine them to applicants whose names are upon our subscription list, we have that protection. Otherwise we have none whatever. So far as profit is concerned, it matters very little to us whether readers purchase the Rural of the news-dealers or send us their yearly subscriptions. But we do not see how we can secure to the former a participation in the Rural's free distributions without granting the same privilege to anybody that chooses to apply.

Though we have many times called attention to the Purple-leaved Beech, Purple-leaved Birch and Purple-leaved Japan Maple in the past, and more especially during the past year, they will not be made unduly notorious by still another word of praise at this general season of transplanting. There are scores of so-called purple-leaved trees which are purple only while the leaves are growing or during the spring. Those above specified retain more or less of the purple hue during the entire season, forming, of course, a decided contrast with the green foliage about them. Of the three, the Birch makes the quickest growth. Its leaves, however, are smaller and the foliage somewhat scanty as compared with the others. The silvery bark, however, compensates for this in a measure. In selecting hardy trees and shrubs for our homes, variety should never be lost sight of. It's as desirable here as anywhere. There is no one plant that combines every excellence, and if we would make our home-grounds objects of general and ever-changing interest, we must secure those individuals which are possessed of characteristic charms. The pleasing peculiarity of purple foliage is seen at its best in the three trees named, while as regards size, habit and leaf-outline, they are strikingly dissimilar.

THE WHEAT CROP IN EUROPE.

The outlook for the next wheat crop among our trans-Atlantic customers, while decidedly better than last year, is not quite as favorable as before the series of three or four increasingly poor harvests that culminated in the miserable failure of last fall in Great Britain and France. The acreage under the crop in the British Isles is less than last year, both because the prospect of close competition with this country has to a considerable extent convinced farmers that it is not likely to pay, and because the winter set in with such sudden and early severity that some lands destined for wheat have been used for other purposes. Nearly all the wheat grown there is sown in the late Autumn or early winter, as only few farmers use the more tender white sorts in the beginning of spring or, oftener still, as early as the middle of February. The weather, however, has hitherto been fairly propitious, and a yield per acre considerably larger than that obtained for the last few years is confidently expected. In France the acreage is proportionately somewhat larger than across the Channel, and the outlook even more hopeful, except in some of the northern departments in which the severity of the past winter has injured the crop. Owing mainly to the protection recent legislation has given to home production in Germany, an increase of the area sown to wheat is pretty certain, and a somewhat larger surplus for exportation is probable for next fall. In Russia a good deal of the fall-sown wheat is reported winter-killed; but spring wheat forms a large proportion of the production of that country. Even as far south as the Black Sea the variety known here as the Odessa, but which is called Ghirka in Europe, is a spring sort whose district is one of the largest and most productive in the empire, extending principally eastward to the Dnieper from the town from which it derives its name among us. Little can therefore be as yet said about the probable production of this powerful rival of ours. Our meager information about the present wheat crop in Spain, Italy, Austro-Hungary and among our other trans-Atlantic customers or competitors, leads to the general conclusion that while the foreign demand for wheat will probably be considerably less than last year among our European customers, the foreign surplus will be at least fully as great among our rivals. It is therefore to be expected that the prices of wheat next fall will be lower—maybe considerably lower—than during the past and present season, unless war should in the meanwhile break out in Europe—an unlikely, but not altogether improbable contingency.

CONDITION OF OUR WINTER WHEAT.

Of the 400,000,000 bushels of wheat produced by this country, by far the largest amount is sown in the fall and known as winter wheat. The latitude of Chicago is generally thought to mark the northern boundary of the region in which this sort can be successfully grown year after year; though some place it as far north as Milwaukee. North of that spring-sown wheat has usually proved the only kind that can be relied on. The isothermal lines, however, do not always, or even generally, coincide exactly with the parallels of latitude, and therefore the line marking the northern limit of the winter-wheat region and the southern boundary of the spring-wheat belt, is irregular, here running considerbly to the north of the above latitude and there not a little to the south. Moreover, there are frequent local conditions, both of climate and soil, specially conducive to the success of one sort or the other, while the seasons often vary so greatly that a variety can be successfully raised one year in a section in which it will entirely fail in another. Despite the longer period of trial to which the fall-sown wheat is exposed, it possesses advantages enough to make the farmers living beyond the region which is steadily appropriate to its growth, anxious to test its production in their own districts. For the last few years experiments of this sort have been increasing, with a fair measure of success, which has almost invariably ended in failure under the exceptional climatic conditions of the past winter and the early weeks of the present spring. On the other hand, within the northern portions of the regular winter-wheat area farmers, when from one cause or another their winter-wheat crop has proved a failure or has not been put in, frequently try their luck at spring-wheat. These remarks are amply illustrated by our crop reports in this issue.

These reports have all been received within a few days—some of them as late as this morning, April 6. With a very few exceptions they all come from intelligent farmers well acquainted with the condition of the crops in their respective neighborhoods; and without any exception they are all the results of the observation of men closely connected with agriculture. The conclusions drawn from a careful analysis of them agree pretty closely with those from various other more local reports published in different parts of the country. Ours, however, have the merit of being the latest and of covering the widest extent of territory, extending, as they do, over the entire country. Still later telegraphic dispatches from various distant points herein reported, show no alterations in the conditions mentioned, except that no part of the country seems now to have any reason to complain of drought, as the late rains appear to have been copious everywhere.

In New England so little winter wheat, or indeed wheat of any kind, is grown that the entire product of the five States makes little difference in the aggregate yield of the country. There, as in nearly all the older settled States, the rotation of crops practiced prevents any very material increase in the area under wheat; but the usual acreage seems to have been sown, and the prospect for the crop appears to compare favorably with that of other years. In the Middle States there is a moderate increase of acreage—probably from five to seven and a half per cent.—and, with a few local exceptions, the outlook is highly promising. This is especially the case in Ohio, which we have included in the Middle States which ought soon to embrace all east of the Mississippi. In a few of the most northern counties of New York and Pennsylvania, the frequent alternate thawings and freezings and the absence of snow, that have proven so disastrous in sections still farther north, have injured the crop considerably, but in the remainder of these States wheat has fully as good an outlook as last year, while in New Jersey and Delaware the prospect is even brighter.

Indiana, which our last year's reports showed to be the banner wheat State—a position accorded to it subsequently by its superior yield—this year also makes a fine show, both as regards the condition of the crop and the increase of acreage. In Michigan, too, the outlook is encouraging, though, with the probable exception of Kentucky, the Hessian fly seems to have been more mischievous there than in any other State. Reports from the northern counties in Illinois, in which spring-wheat is generally more extensively sown than winter, are unfavorable, but those from the rest of the State are encouraging except on level, undrained lands. The acreage under winter wheat throughout the State is probably only about five per cent. more than last year, while on the whole, the yield will, most likely, be lighter. Wisconsin is largely a spring wheat State, and from it the reports of winter wheat are varied—badly winter-killed in some parts, and very thrifty in others. The acreage is larger than last year, but the yield will probably be less.

West of the Great River winter wheat seems to be badly damaged in Iowa and Minnesota—almost, indeed, an entire failure. Spring wheat, however, is the chief wheat crop in both States, and doubtless much of the ruined fall-sown wheat will be plowed up and the land sown to the other sort, so that the aggregate yield is hardly likely to be much less than last year, though the acreage under winter wheat is greater. In some parts of Missouri, especially in the northern counties, the crop has been badly injured, but, on the whole, the reports are highly encouraging. The acreage is larger than last year, and the yield will hardly be less. Kansas officially promises a yield of 30,000,000 bushels, and the vast increase of acreage under the crop, together with its fine condition, goes a long way towards realizing this brilliant pledge. The climate, however, is still apt to justify the old sobriquet, "Droughty Kansas," and although telegrams from that State just received here, show that the fears of drought expressed in some of our reports have been removed; still the dangers are so numerous until harvest that our many friends there would probably be content to compromise for a certainty of a somewhat smaller aggregate yield. Nebraska is mainly a spring-wheat State, and though a somewhat larger acreage than heretofore was this year sowed to winter wheat, yet the crop has been so damaged that the yield of this sort will scarcely be so great as last year, but the deficiency may be made up by sowing a proportionately larger acreage to spring wheat. In the Territories east of the Rocky Mountains but little winter wheat is sown, except in Utah, and reports thence are uncertain. The acreage under winter wheat in California is considerably larger than last year, and recent telegrams announce that the fears of injury from drought entertained in many places, have been removed by abundant rains.

It promises well for the South that it appears to be paying more attention than heretofore to the production of cereals enough for self-support. The acreage under wheat there this year is considerably larger than last, and the prospects for a good crop are flattering, especially in Texas, several of whose northern tiers of counties are admirably adapted to the growth of wheat which can be put on the market from a month to six weeks earlier than our Northern grain.

On the whole, judging from the reports of our own friends, and from many other accessible funds of information, we have come to the conclusion that the *present* indications of the winter wheat crop portend about the same aggregate yield as last year from a largely increased acreage.

BREVITIES.

The White Elephant.—The reader will naturally look for an explanation. But he must have patience.

Puck's suggestion that Oleomargarine be colored blue, red, green or some other loud color with harmless dyes, would severely test its value—and the sincerity of the asseverations of the manufacturers that they desire it should be sold upon its merits!

The New York World says of Teosinte:—"At the North, if sown in hot-beds during the spring and transplanted to the open ground in May, Teosinte will afford a decorative plant for large gardens." This Teosinte resembles corn so closely that until it blooms, it would be hard to tell one from the other. The idea of "sowing" (!) this in hot-beds to be transplanted for ornament!!

A well-known nurseryman writes us: "It is with great pleasure that I tell you that trade thus far has exceeded my wildest anticipations." Again he says: "In some things, such as Cuthbert Raspberry, Sharpless Strawberry, etc., the demand has surpassed a rage or furor and is assuming the appearance of a panic." It is a panic we imagine that can do little harm. We trust it will continue to spread and involve every farmer and gardener in its effects before it subsides!

Many people have a sort of passion for dosing themselves every spring with medicines. Many dose their farm animals in the same way. "The system needs clearing out at least once a year!" It is well to know that medicines are really disease-producing agents, and that they can do us no good unless we are suffering from disease. On the contrary, the effect of medicines upon the healthy system is necessarily injurious. Take medicines only when sick, and not then, if nature can restore health without them.

At the Rural's farm we raise a large quantity of rhubarb—probably enough for 20 families. We have always given it to all applicants and have never run short for the Rural farm family. Horticultural books usually say that the soil "cannot be too rich for rhubarb." But we have never seen larger or thriftier plants than our own and they grow in a sandy soil that often suffers from drought and would not, in its present condition, grow over 40 bushels of shelled corn per acre. We are therefore of opinion that rhubarb needs a light, well-drained soil rather than richness.

We are sorry to see that members of the Elmira Farmers' Club are advocating thin seeding and cultivation for small grains. Our own experiments were carefully made on winter wheat (Clawson), and as our readers may remember, the yield was less than 15 bushels per acre. We have further experiments under way this year with half-a-dozen different kinds of winter wheat. The wheat plant can be made to tiller just so much. If the plants grow so close as to occupy the entire ground, there is no room for thorough cultivation. If set further apart the difference in the yield, granting it will be more, will not be enough more to pay for cultivation. It may be an exceptional case, but our cultivated plants suffered more from rust than those the seeds of which were drilled in the usual way.

The largest sale of Short-horn cattle ever known in England, came off at Birmingham, early the past month. Nearly 400 animals were offered, and it took two days to get through the catalogue. The prices were satisfactory, being a considerable advance over those of last year, which is quite encouraging to breeders, and adds a greater popularity throughout the United Kingdom than ever to Short-horns. We understand the principal purchasers were farmers, and not wealthy amateurs. These wanted the cattle for the improvement of their own private farm stock, rather than to breed from for fancy animals, to sell at high figures hereafter. The large hall where the sale came off was densely crowded with buyers, so much so as at times, to make it quite inconvenient to get round among the crowd. We hope this large successful sale in England, will stimulate American farmers to be up and doing in the same line.

LATEST CROP REPORTS.

(Continued from page 234.)

EASTERN STATES.

New Hampshire.

HAVERHILL, Grafton Co.—Winter wheat in this vicinity is scarce, and what crops there are, bid fair to be somewhat injured by the open winter. As for the fly, we are never troubled with it. The acreage is less than last year. H. H. B.

REED'S FERRY, Hillsboro Co.—There is but a very little wheat raised in this county—hardly enough to report. The acreage is about the same. The winter has not been favorable for winter grain. F. F. W.

Vermont.

FRANKLIN Co.—There is no winter wheat grown in this part of the State and very little in the State at all. I have known occasionally a small patch along our lake, but do not know of any now. Winter rye is more common on the pine lands that are interspersed here and there over the State, but there is but little of that. It is believed that it has suffered but little from the open winter, but it is too early to say positively. O. S. B.

GUILFORD, Windham Co.—Snow on the ground. Wheat not forward enough to judge whether it is hurt or not. An average acreage is under it. C. C. P.

Massachusetts.

AMHERST, Hampshire Co., Mass.—Wheat is little injured by the winter and is in good condition. Hessian fly unknown here, and no prevalent disease, though occasionally it is injured by certain climatic influences. The average is about one-fifth larger than last year. L. S.

EAST LONG MEADOW, Hampden Co.—Very little wheat is grown in this section—not enough to be noticed.

NEWBURYPORT, Essex Co.—Very little wheat raised in this vicinity, and I have not heard of any change as to amount of land devoted to it. I have not raised any for several years on my farm. J. H.

Connecticut.

LITCHFIELD, Litchfield Co.—But little winter wheat is grown in this vicinity; what little there is here promises a fair average crop. J. S. S.

MIDDLE STATES.

New York.

COXSACKIE, Greene Co.—Wheat is an experiment with us about here, this year being only the third time that it has been generally sowed. I have raised two crops of over 20 bushels to the acre. I do not think the open winter we have had has hurt it any. The Hessian fly is something that we know nothing of. The only trouble we have is the weevil and some fields were infested with this pest last year. The acreage is more than four times that of last year; almost every farmer has a large field of wheat. J. H. L.

FLUVANNA, Chautauqua Co.—Wheat looks fine. The winter has been light, and has not done it any harm. No signs of any disease or of the fly. The prospects are better than in the spring of 1879, and the acreage is larger than usual. I was across mine to-day and it is all I could desire. I have been the length of the State twice and, as a general thing, wheat looks fine. I shall soon sow lime at the rate of 10 bushels to the acre, and then harrow when the ground is dry. H. A. W.

Pennsylvania.

WEST MILL CREEK, Erie Co.—Wheat in this section is looking fair on gravelly land, but on clay land some has been winter-killed. The winter has been favorable for wheat, with the exception of some cold, dry winds. The promises of a good crop are better than last year. There are no signs that the fly has hurt it; nor is any disease affecting it. J. F. M'C.

Ohio.

ATWATER, Portage Co.—Wheat, as a general thing, looks well. The winter has been warm and wet, but the water has not injured the crop on land that was well drained. No signs of disease. Some few pieces that were sown in August were infested by the Hessian fly, but this is less than one per cent. There is fully one-half more wheat on the ground this year than last, and it never looked better for the time of year. R. W.

BELDEN, Lorain Co.—The condition of wheat is good. It has not yet been injured by the winter and there are no signs of Hessian fly. It compares well with that for the past three years. Acreage one-third larger than last year. J. S. P.

BIRMINGHAM, Erie Co.—The condition of the growing wheat crop is good. The winter was very favorable for the late sown; of late, however, the nightly freezings and daily thawings are heaving it out of the ground on upland. No fly, and no disease. On the whole, the prospect is good for a full crop. M. L. G.

BLOOMVILLE, Seneca Co.—Wheat was not injured by the winter. Within the last two weeks it has been hurt somewhat by the weather, which has been dry with frequent freezing and thawing. To what extent it is damaged it is hard to tell at present; but on clay land it is hurt considerably. We have had a good rain which will help the wheat. No disease. No sign of being hurt by Hessian fly. The acreage is larger than usual. G. M. M.

CHARDON, Geauga Co.—Wheat looks very well. Where phosphate was used it shows no signs of disease; but where it was not used it is badly injured by March winds and hard freezing. It does not look as well as last year, there having been no snow to protect it. No damage by fly. Acreage about the same as last year. W. M'B.

FOSTER'S CROSSING, Warren Co.—Our wheat is looking splendid in spite of some very trying weather in the fore part of March. J. D.

HAMILTON, Butler Co.—The condition of wheat is fair. The rains have done it injury; much of it has a yellowish appearance. The fly has not seriously damaged it. There is about 10 per cent. increase in the acreage. A. B.

MOOREFIELD, Harrison Co.—Wheat looks better than last year, though in some fields it is quite small on account of late sowing and the dry fall; but it appears to be fairly rooted and healthy. The winter was mild and did not hurt it much or any, and it appears to be free from disease and shows no signs of the fly as yet. The acreage is 10 to 15 per cent. larger than last year. J. N. L.

WAUSEON, Fulton Co.—In our section of country, the wheat looks fine and healthy, and covers a larger number of acre's than last year. No damage from the fly. T. R. M.

WESTFIELD, Morrow Co.—Winter was very favorable to fall-sown wheat. March, the first spring month, however, has been less propitious owing to the frequent alternate freezings and thawings—yet the crop doesn't seem much hurt by this cause. The dry weather and the Hessian fly injured some fields last fall, destroying at least a quarter of the crop in some fields. In spite of all drawbacks, however, the outlook so far as I have heard or seen, is the brightest for 25 years. As there was a poor "catch" of grass last year, the acreage under wheat this year is at least one-third more than usual. J. B. B.

W. ZANESVILLE, Muskingum Co.—The past winter has been an unusually mild one for our latitude, and the growing wheat crop generally looks well; but for the past few nights we have been having quite hard freezing weather that has changed the appearance of the wheat fields considerably. The acreage sown is somewhat larger than usual—say 15 or 20 per cent. I hear no complaint of any disease or damage by the fly, and all things considered, we claim the prospects rather better than usual. J. S.

Maryland.

MASSEY, Kent Co.—Wheat looks fine, and at least six weeks in advance of what it was this time last year. The acreage is one-third larger, and the land produces from 15 to 40 bushels per acre. Wheat has grown every day this winter. The bulk was seeded from the 1st to the 20th of October. The fly troubled the September seeding slightly. This has been a peach region, but a failure for a few years past has caused the removal of one kind of the trees. C. H. B. M.

TRAPPE, Talbot Co.—The winter has affected the wheat favorably. No signs of the Hessian fly. It looks better than usual, and the acreage is larger. R. B.

WESTERN STATES.

Michigan.

ADRIAN, Lenawee Co.—The winter has been hard on wheat. Some fields look fine; some bad. The crop is about the same in appearance as on other years. The fly, I think, has not harmed it much. The acreage is larger than last year. That sown on loose soils has suffered the most from frost. H. D.

GREENVILLE, Montcalm Co.—Wheat has gone through the winter very well as a whole, and some pieces look fine, indeed. On fields that had a large growth last fall, the tops have turned yellow, but the roots are all right. Some pieces were injured last fall by the fly, but I think most of them sprouted up below and will give an average crop. The prospect is fully as good as last year's. The acreage is about one-fourth greater. C. S.

UNIONVILLE, Tuscola Co.—It has been rain, mud, freeze, and thaw all winter. The wheat has been injured very much. It is worth $1.11@1.15; corn, 50@55c; barley, $1.25@1.50c; oats, scarce at 44c. 50; potatoes are in fair supply at 45c 50. onions are very scarce at $1.40@1.50 per bushel. Butter is scarce at 17@26c. per pound. Eggs plenty at 10c. Hay plenty $7@$8. Shingles, $1.50@2.50 per thousand. Lumber, common, $7.@8; clear, $18@20. Maple sirup, scarce, and a really good article commands $1. L. A. R. NO 2.

Indiana.

CHURUBUSCO, Whitley Co.—The condition of wheat is middling. March was a hard month on it. It has not been harmed by the Hessian fly. The prospect now appears to be as good as last year. Acreage larger than usual. M. M.

GLENWOOD, Rush Co.—The winter has been warm and open, and wheat is making a fine growth. No signs of the Hessian fly. The general appearance was never better, at this time of year. The acreage is larger than usual. W. R.

INDIANAPOLIS, Marion Co.—Wheat looks fine in this section. The winter has not injured it. It does not show signs of any disease. No Hessian fly. It looks much better than usual, about as well as this time last year. A large increase in acreage. V. & S.

LOOGOOTEE, Martin Co.—Wheat, as a general thing, looks very well and as the winter was exceedingly mild, the crop was hurt only in low places where the excessive rains drowned it out. Its general appearance, as compared with that of former years, is good. The acreage sown is larger then ever before. The fly hasn't bothered it yet, so far as we can see. Wheat is selling at $1.10@$1.15; corn, 50c; oats, 50c; potatoes, 75c; horses and mules in good demand. Prices for horses, $40 to $150, and for mules about the same. W. F.

OTISCO, Clarke Co.—The condition of wheat hereabouts is good. No disease, but the fly did some mischief last fall. The crop compares well with those of other years and the acreage is one-third greater. J. B.

WARSAW, Kosciusko Co.—Wheat here is damaged much by freezing only on low, moist land or land that has not been well drained. It shows no signs of disease; the Hessian fly is something that I know nothing of; the weevil is the only insect we have to fear from this on. If we are not troubled with that, I think we shall have more than an average crop—probably not so large a one as last year, for that was the largest crop that we ever had, and it was also of first quality and sold for a very fair price—from 90 cents up to $1.35; but it is now worth $1.20. The acreage sown last fall will more than average with other years, I think. Good stock brings good prices and poor animals poor prices, as is always the case, but of all stock sheep are trumps now. They are higher than they have been for ten years. G. A. T.

WESTVILLE, Laporte Co.—Our wheat has suffered very little from winter. It shows no sign of disease, and is not badly hurt by the Hessian fly. Its present appearance is above the average at this time. We are having a warm rain and it is brightening up very much. The acreage sown has been increased. We have a very fine wheat country. Last year several fields averaged from 45 to 50 bushels per acre. C. W. C.

WINAMAC, Pulaski Co,—Winter has not hurt the wheat hereabouts. No disease or fly. Prospects much better than in any former year, and the acreage much larger. The crop looks much better than I ever saw it at this season. L. J. N.

Illinois.

KANKAKEE, Kankakee Co.—We have had an open winter, which has damaged the winter wheat. Some fields are entirely killed, while others are badly damaged. The Hessian fly has never injured wheat here; the only insect that we have to fear is the chinch bug, and that seldom harms the winter wheat. There was a larger acreage sown last fall than for years. J. M.

MACOA, Macon Co.—The condition of wheat is much above an average, but not so good as last year which was an exceptional one. It has been hurt somewhat by freezing and thawing in March. No fly. Acreage fully one-third greater; some claim one-half. Ground has been in fine condition and a large part of the oat crop is in. W. A. VAN L.

MASON CITY, Mason Co.—The prospects for the wheat are good. More was sown last fall than for any of the previous 10 years. S. S. B.

TONICA, La Salle Co.—We have not raised much winter wheat for 25 years, and for a number of years not very much spring wheat. We rely mostly on corn, oats, hogs, cattle and some sheep. We are not troubled much by the Hessian fly, but are sometimes bothered by the chinch bug. The prospect for wheat this year is very poor. We have had a very open winter and I think it is mostly killed. I don't know of any disease. J. B. E.

Wisconsin.

HAZEL GREEN, Grant Co.—The condition of the wheat is bad; the past winter has sadly injured it. It is what the farmers call "winter-killed." The few patches that have been somewhat sheltered show no signs of disease. No sign yet of being harmed by the Hessian fly. The general appearance of what is growing, as compared with other years, is somewhat unfavorable. The acreage is larger than that of other years. We may say the wheat crop (winter wheat) is a failure. W. H.

LODI, Columbia Co.—The condition of winter wheat in this section is very poor. There has been but a very little snow. Rain, mud, freezing and thawing have killed the wheat. There is no Hessian fly here. The general appearance of the crop is very poor compared with the crops of years back. I think three or four times as much was sown last fall as there had been years before, because it was an uncommonly good crop last year. On the prairie they tell me it is all dead. In the openings, hopes of half a crop. I am in the openings. E. M. S.

SHARON, Walworth Co.—We have not been troubled with the Hessian fly for several years. I think there are four acres of winter wheat where there was one last year. The crop does not look very promising now; but a warm rain might save most of it. On the other hand, a few more cold, dry nights without rain, will kill it all. R.

Minnesota.

LENORA, Fillmore Co.—Winter wheat is looking well. This is a prairie county and we have raised spring wheat up to the present time. Our two last crops were almost failures on account of the extremely warm weather, so winter wheat is an experiment. Our climate has changed since I came to Minnesota, 23 years ago. Our winters are like those of central Ohio and our summers are very warm, and we have got to change our manner of farming. If winter wheat does well we shall continue to raise it; if not, we shall turn our attention to other branches of farming. O. F. H.

ST. PAUL, Ramsey Co.—There is but little winter wheat raised in Minnesota; our winters are too cold and our snows are too light. We are not troubled with Hessian fly; but one week of wet, cloudy weather, when the wheat is in the milk, does us great damage. The acreage of spring wheat will be larger than usual. Scotch Fife is our best wheat. No. 1 is quoted at $1.07; No. 2, at $1.04; oats, 32c. on track, 35c. by wagon; corn demand light, 35@38c. Many elevators are being built in order to hold the crops and control prices. One about finished has a capacity of 1,016,000 bush.; another, to be built by the Milwaukee road, will be able to store 1,000,000 bush.; one in Duluth is of the same size; one just finished in Minneapolis, nine miles from here, has a capacity of 800,000 bushels. K. P. O.

Iowa.

DECORAH, Winneshiek Co.—This has always been a spring wheat section; but, owing to poor crops for a few years past, many farmers were induced to try winter wheat last fall, in small quantities; partly as an experiment. Some think it is nearly all killed, and some that it is not. I think that, with favorable weather in the future, we shall have a fair crop; but as the frost is not yet out of the ground, it is hard to tell. Owing to poor crops, farmers have turned their attention rather more to stock raising, so I think there will not be quite as much sown this spring as there has been for years past. The Hessian fly we know nothing of; but have been pretty well acquainted with chinch bugs for a number of years; they do their damage just before harvest. R. G.

FAYETTE, Fayette Co.—The condition of winter wheat in this county is very poor. The mild temperature of the past winter, with the consequent freezing and thawing, has seriously affected the plant. The fields look brown and dead, with no apparent vitality above ground. The acreage is largely increased. Have heard no complaint of Hessian fly. M. S. H.

MASON CITY, Cerro Gordo Co.—There was very little winter wheat sown here last fall for an experiment; but it is badly winter-killed. R. L. L.

MONTICELLO, Jones Co.—Winter wheat has never been raised in this section to amount to much, for the reason that it was said that it would winter-kill, and as spring wheat has generally been a good crop here (until within the last year or two, when it has been almost an entire failure), winter wheat has never been tested as it should have been. In a radius of five miles from my place I do not think there are 100 acres of wheat sown, but there is more in the Eastern and Southern parts of the county. I have about 2½ acres, the first that I have sown. At the present time the leaves are dry to within two or three inches of the ground, but are a dark-green below that. There is, now and then, a plant that seems to be dead or rotten; but most of it, I think, will start when the ground is thawed out. As to the Hessian fly, I do not know anything about it. A. B. T.

PLEASANTON, Decatur Co.—Wheat is badly winter-killed, so much so that a great deal of it will be plowed up. No signs of disease. The Hessian fly injured some pieces a few miles south of us. General appearance bad. Larger acreage than common. W. E. P.

RED OAK, Montgomery Co.—The winter here was very dry, with little snow and frequent freezing and thawing. The general appearance of wheat is that the stalks are dry and dead, yet upon close examination many of them are green within. No signs of disease. No Hessian fly. The crop looks inferior to that of previous years; the acreage is probably greater. H. S. W.

Nebraska.

LINCOLN, Lancaster Co.—Winter wheat in this county is fairly good. Some pieces were partly winter-killed, but the average will be good. This is not a winter wheat country, but each year shows an increased acreage. No signs of disease; no much fly. M'C. & D.

PALMYRA, Otoe Co.—Winter wheat is not grown very extensively in Nebraska. More than usual was sown last fall, and nearly three-fourths of it is killed, owing to the dry weather during the winter. Many pieces will be plowed up. No complaints of the Hessian fly, or disease. Chinch bugs are feared somewhat, as they have heretofore done considerable damage. D. F. W.

Kansas.

EVERETT, Woodson Co.—The wheat at present, as far as I have seen and heard, is looking very promising. Owing to the favorable weather of last fall and winter but very little wheat, if any, has been winter-killed, and it does not show signs of any disease. I have not heard of any appearance of the Hessian fly. It is looking far better at this time than any previous year since I have been in Kansas, and there is at the least calculation a third more acreage sown. The weather couldn't be much more favorable for wheat than during the past winter, as it has been rather dry and no bad frosts to heave the crop, and but very little hard, drying winds to expose the roots. The wheat is not suffering, but a good warm shower of rain would do it good. J. J. D.

FREEDOM, Butler Co.—Everything is looking fine and crops are being put in. Oats are sown; potatoes, early ones, are planted, and corn ground is being turned over in large quantities for early planting. There is no particular change in markets, except in oats, which are getting well up. Stock of all kinds have been well wintered here, as corn and fodder are plenty and cheap. W. L. B.

TORONTO, Woodson Co.—Wheat in this section shows no signs of disease whatever. Acreage about the same as last year—perhaps a slight increase. Have never heard of the Hessian fly in this section during a residence of nine years. Wheat is suffering a good deal from drought, many pieces on loose upland being ruined; while on strong bottoms it is good. I think the prospect is better than a year ago, if we have rain soon. I speak of Woodson, Wilson and Greenwood counties. E. A. H.

California.

FRESNO CITY, Fresno Co.—The growth of wheat here has been checked by long-continued frosts. No disease or fly, the latter being unknown here. The general appearance of the crop in comparison with late years, is fair, and the acreage more than double. S. H. H.

WATSONVILLE, Santa Cruz Co.—Our winters never injure the wheat in this valley. It shows no sign of disease. We have never had the Hessian fly here. The general appearance of the crop is good and the acreage the largest we have ever had by one-half. J. A. B.

WOODLAND, Yolo Co.—The winter was favorable, to wheat here. No disease. We have no Hessian fly in this State. The crop is backward; as the season has been colder than ever known since the State was settled. The acreage is large. S. P. P.

Literary Miscellany.

SPECIAL ANNOUNCEMENT.

In our issue of May 1st we shall begin the publication of an original Farm Story, by Charles Richards Dodge, the author of "Louise and I," a Sea-side Story, published by G. W. Carleton & Co., New York. It combines the bright, practical, scientific and romantic sides of the subject in question, and shows the value of a scientific education upon the farm; also that success may come through failure, and that a woman is a help to a man in the achievement of success. Our readers will be instructed as well as entertained, as the agreeable and impressive manner which is employed to convey the thought of the writer cannot fail to be appreciated.

THE BALANCE SHEET.

Life's Ledger opens and a strange new date
Is on the page that else were pure and white,
And we must cast our balance-sheet of fate,
Sum up the columns of the past, and write
What we have gained from the great circling year;
What we have lost in hours swept idly by;
What we have spent in follies all too dear:
What we have saved in life's great treasury.

How much of worldly wisdom we have gained,
What dear illusions lost, like fleeting breath,
And for our gold and pearls what poor exchange
In gaining knowledge and in losing faith.
What notes of promise written in our name
Have gone to be protested in life's bank;
What checks for charity and virtue drawn
Our souls have never signed but with a blank.

Alas! what double entries have we made!
The world on one side, on the other God;
Who holds the balance? can our debts be paid?
Where is our stock, and is its value good?
Have we placed all our winnings in the dust?
Put them on interest in some earthly mine?
Or are they high and safe from moth or rust,
In human sympathy, in love divine?

Rich, not in the abundance that we have,
The year's full horn is emptied at our door:
The soul hath other merchandise to save—
'Tis what we are that maketh rich or poor.
The deeds that we have done with vaulting pride
Hoping that some large interest they would pay,
May count for nothing on the other side
Where angels keep the books a different way.

Our souls dream journeying wander down the past
To that dim forever that lies far behind:
The sum of shine and shadow that is cast
Counts more than all the present wealth we find.
Memory, the treasure of our golden dreams,
At the old fireside ever keeps us room.
Tired of the tumult of life's busy schemes,
Our pilgrim hearts to-night are going home.

What muffled echoes fall across our path,
Footsteps of loved ones that are caught away!
What have we lost in this time-circling tide!
What have they gained in that Eternity?
And do they give good gifts to those they love,
These angels over leaning from the skies?
Have they a New Year on the hights above?
What are they doing now in Paradise?

What have we gained by all that we have lost?
Patience and strength to bear anew the strife;
The soul climbs upward only by the cross,
And sorrow is the crowning crown of life.
Our future lies close folded on the now:
Each precious moment that we throw away,
Like wanton spendthrifts of our golden sands
Is heavy with eternal destiny.

In God's arithmetic no cipher's lost,
Each bears a stamp of value that's divine.
O may our souls at last be found at par
With earth's great duties and with heaven's design.
And may the page of life whereon we write,
However blotted and with tears made dim,
Be lumined ever by the falling light
Reflected from the Star of Bethlehem.

A SUMMER VACATION.

(Continued from page 221.)

"It may be so. But, my girl, take an old friend's advice, and do not be hurried into matrimony."

"I promised readily I would not, for I had already made up my mind not to marry for sometime at least.

"Captain Chesney pleaded long and often that I would change my decision; but I remained firm, nor would I allow any of his entreaties or arguments to shake me in the least.

"Several months passed, but as the time went on my lover grew restless, haggard and distressed. Indeed, so marked was his uneasiness that I could not help adverting to it.

"Guy," I said, "let us be frank with each other. You are in some great trouble; tell me what it is; surely I have a right to know what causes you such evident distress of mind?"

"But he gave me only an evasive answer and tried to change the conversation.

"You may well feel a certain amount of delicacy upon the subject,"—he started and looked at me somewhat wildly as I said this—"and I can easily understand such would be the case. Yet, as I said, let us be frank with each other. Do not be offended with me for what I am going to say, but, Guy dear, you are pressed for money. There, that is the simple truth; and now the worst is over. It is so, is it not?"

"He replied by an evident effort:

"I am ashamed to confess it, but it is true—quite true. No one knows what I have suffered for my indiscretion. My father cannot, or will not, lend me any assistance, and I am now in serious difficulties."

"He was much overcome as he spoke, and clasped his hands over his face; but I pulled them away with gentle force, and stroking his hair back from his troubled brow, said:"

"'I am so glad, Guy, that we have had this understanding with each other; we shall both be happier for it. Now, in the first place you must give me your promise to be most obedient; to be governed by me in this affair; to do without argument or scruple all that I advise.'

"'You are a good girl,' he said; 'too good for me. I am not worthy of you!'

"'I will not hear you say that—nor will I let others say that you were in momentary difficulties when you married me. Now here is what I want you to do, and remember you have promised beforehand to execute my wishes. You must let me free you from these liabilities!'

"He endeavored to protest—to interrupt; but I went on.

"'I wish to do it,' I said, 'in a manner that will be the least painful and embarrassing to both of us. I do not wish to know the sum you owe, nor even the names of those to whom it is due, nor the circumstances under which the debts were contracted. Keep that a secret from me. See, here is a check, duly dated and signed, and made payable to your order; but as you perceive, the amount is left a blank. You see now what I wish you to do. Take this blank check as a free gift from me, fill it up with such an amount as will free you entirely from your difficulties. Do not tell me the sum—I do not wish ever to know it; but I have given special instructions to the banker to honor this draft. Take it, Guy, to oblige me, and let me have the happiness of knowing that I have set you free! And when you can tell me that no one has any claim upon your purse, then I shall be ready to be your wife."

"I will not attempt to repeat his thanks—his protestations of gratitude and affection. But when he accepted the check I felt a glow of joy to find that I had it in my power to free him from a disgraceful thraldom!"

Miss Linwood paused. The sun had set, and a chill wind was blowing from the sea.

I saw that her recital had affected her deeply; yet that there was something of a painful character to come was evident.

"I do not think it is safe for you to sit here any longer," I said. "Let me recommend you to go back to Melcombe Cottage; you can finish your story at another time."

"It is chilly," she said, rising to her feet. "I will follow your advice; in fact, I will return at once, but I will finish what I have to tell you during our walk; the narrative is nearly over."

But seeing that in spite of herself she was trembling violently, I offered her my arm.

She thanked me in her sweet way as she availed herself of the support. How her touch thrilled me—thrilled me, although any wild dream that I may have had about making her my wife seemed farther from a realization than ever—for had she not acknowledged her love for another!

"Well, doctor!" she resumed with a sigh, "I have told you that I gave him the check, and that I looked upon him as a free man."

"What faith you must have had in him!" I ejaculated with a jealous pang.

"And what is love without faith?"

I did not attempt to reply, but asked instead:

"Had you at this time any idea of the amount of Captain Chesney's liabilities?"

"Only a vague notion. I felt, however, that the sum could not excel a few thousand pounds."

"A few thousand pounds!" I repeated, aghast, for the calmness with which she spoke amazed me; "and you were prepared to give up such a sum?"

"You forget I told you I was an heiress."

"Yes, but——

"Wait a moment, I must now explain that my father had left comparatively little real estate—I mean landed property; nearly all his money was embarked in various undertakings, such as bank and railway shares. These investment for the most part returned a high rate of interest, but involved a considerable amount of trouble for a girl.

"Some time before the occurence of these events it so fell out that a very large residential property came into market. It was one of those stately homes for which England is so famous.

"It was a place I knew well and admired greatly. It was here I felt that I could make a home and live in perfect happiness.

"My father's solicitor effected the purchase and the deposit was duly paid. Then he commenced to sell out from the various companies, and the money realized was from time to time paid into the bankers.

"Knowing that there was a large balance standing in my name made me think of this plan for relieving Captain Chesney. I considered the whole thing could be done and no one be any the wiser.

"It was not long after his departure that I was informed that someone from the bankers' desired to see me on urgent business.

"'Do you wish to speak about a check presented by Captain Chesney?' I asked.

"'Yes, miss. It has been filled up for a large sum, and we thought——'

"'It is quite correct,' I answered, for I felt a good deal vexed that the captain should have been put to the annoyance of having the draft questioned in any way. 'I sent notice to the bank that such a check would be produced.'

"'But the amount is so large that——'

'It is quite correct; you have my authority to pay it at once.'

"The clerk bowed and withdrew. As for myself, I had perfect faith in my lover's honor—indeed, the suspicion that he would wrong me, or betray my confidence, never once entered my heart; and instead of feeling any regret at the largeness of the sum required to discharge his debts, I was instead deeply thankful I had the means of doing him so great a service.—To be continued.

SKETCHES OF GERMAN LIFE.

BERTHA A. WINKLER.

Winter Scenes.

Snow, snow everywhere; on the roofs, in the streets, in the air and, one could almost say, over the hearts of the people, so quiet and gray, and wintry look the faces of the persons who noiselessly glide past us with heavy loads of fagots on their backs. Indeed, this white icy mantle seems to have covered the genial smile, as well as the once blooming fields. A dull, oppressive silence prevails in the deserted streets; one listens in vain to catch the merry ring of sleigh-bells, or the huzzar of boys sleighing down the hill. A few old sleds loaded with wood and drawn by a team of sleepy oxen take the place of the former, and the latter, though they pour wildly enough from the school-house and a few snow balls do fly in the air, scatter in the direction of their respective homes and are soon lost out of sight. All is silent as before.

Now a few of them reappear, with odd-looking wicker-baskets suspended on straps from their shoulders. Well fortified against hunger with huge slices of black bread, they start for the forest in search of fire-wood. Just how this is obtained in forests which have long been stripped of every available shrub, and which every autumn is even raked of its dead leaves for staple-purposes, our readers, viewing their own broad forests full of dead-wood, will find hard to answer. But let us follow them briskly wading through the snow towards the forest where they separate, and, in different directions, begin their search for cones and dry twigs among the bleak, bare branches overhead. One with practiced eye soon ferrets out the tree worth climbing, and in the ice and snow he scrambles to the very topmost branch, shaking down the fir-cones or breaking the brittle twigs which yield to his touch. Very often, after a fruitless search, or in disagreeable weather, some green twigs are smuggled in his bundle, and then a sharp look-out has to be kept for the Forester who sometimes makes a very unexpected appearance and, examining the bundle, places a fine upon the green twigs, or takes the trembling culprit for a few days to the village-prison on bread and water for violating forest laws.

The boys, however, contrive to elude him by trickery or, in last extremes, make good their escape by a sharp run with the Forester's dog at their heels. Though dreaded and disliked by the whole peasantry, these youthful Teutons often make game of him and have no end of fun at his expense But, to timid children and poor women the sight of the Forester's green-braided coat, his dog, and gun is absolutely terrifying, though that does not hinder them from taking advantage of his absence whenever the opportunity presents itself. This does not surprise us, however, when we consider the bitter necessity which compels them to such measures. With them, life is a question of existence, not of comforts or enjoyments. It is not gain, but life, which depends upon their labors. And with many such, a life is merely a prolongation of misery and hardships, in summer a struggle for bread, in winter a struggle for fuel.

What we have said to the poorest class is also applicable, though somewhat modified, to the more well-conditioned peasantry. The silence and the gloom of winter rests upon all. Everywhere we see the same grave, and almost joyless faces. Life to these people, is something, infinitely earnest at this season; the rush of spring and summer and the merry festivals of harvest are past, these no longer occupy their mind to the exclusion of all else. Perceptive faculties expand as the pressure of immediate necessity gives way, and, however bright and joyous those halcyon days of summer may have seemed, life in winter and comparative leisure assumes its real and serious aspect. Then they have time to reflect, to plan, to think. Then the droll easy-going peasant who lives in the crude simplicity of his forefathers, is the modern, intelligent, clearsighted man who observes public events with much more interest than the authorities would be pleased with. Who sees, and knows, and judges and condemns, though himself unknown and unseen in his valley-village. Whose sacred watchword instead of "*King* and *Government*" which the schoolmaster drills into the boy; the pastor preaches to the youth; and the magistrate thunders at the man, is "*Liberty* and *Fatherland*" and who would fain utter hard, indignant words against oppression and extortion if he dared; but a half-dozen government officials in the capacity of field-guards and forest-guards are ready to communicate the slightest expression of disapproval at head-quarters and the discontented party would soon be given to understand, in no gentle terms, that the government does the thinking and the peasant the laboring. If parents show him the virtue of silence, government teaches him the necessity of it.

To a casual observer the peasants appear timid, and simple-minded. But this is just what government wants. It trains them into "*unconditional obedience*" and allows them just enough responsibility, and freedom of action to be self and state supporting; or, in other words, to enable him to worm himself through life upon soil. Our observations have resulted in quite a different opinion of him. We know that with all his simple-mindedness, which, however, is more of good-nature than anything else, he knows the hand of the oppressor. His eyes are wide open when the tax-book is placed before him. A conversation we overheard may serve to show that they are not quite as stupid as they seem:

During our interview with the village magistrate, a peasant timidly entered and with his hat in one hand and the door-handle in the other as if ready to make his escape in case of danger, he requested the Herr Schult-heis to furnish him with the necessary papers for emigration. "But why do you want to leave the country, Johannes?" inquired the Schult-heis. "Well," was the reply, I have a book at home, and whenever I look in it I want to go and settle in America." The Schult-heis opened his eyes to think that one of *his* Bauers would read such a book. And, "what is the book; who gave it to you?" he snarled, in the man's face. "Hem," replied the peasant; a little non-plussed at his manner, "its my tax-book and the Herr Schult-heis, himself, gave it to me." I need not add that he obtained his emigration papers without further delay.

Knowing the condition of affairs, we are not surprised at the many serious-thinking faces that we meet with now. This unusually severe winter has brought increased want to many and makes strict economy a necessity for all. The enormous expense of a standing army are levied upon the people, while the flowers of Germany, the support of many aged parents are idling their time away in barracks. There is not much said in Germany but a great deal seen, and felt, and reflected in their faces. Those mild, blue eyes with their timid, furtive glances tell tales which lips have never breathed. Their first-born, their all is taken from them to maintain the power, the greatness and lustre of Imperial Germany.

MAGAZINES FOR APRIL.

Scribner for April closes the XIXth volume of this Magazine, which will be ten years old in November. The current number contains a large variety notwithstanding the space given to the serials, including Mr. Roe's "Success with Small Fruits;" Mr. Cable's "Grandissimes;" Mr. Schuyler's "Peter the Great;" the third of the four parts of "Louisiana" shows an admirable phase of Mrs. Burnett's genius, the scenes between Louisiana and her father being among the most touching passages of her writing.

Single papers of popular interest are not wanting in this number. "The Growth of Wood-cut Printing," by Mr. Theodore L. De Vinne, the printer of Scribner, deals with Early Methods on the Hand-Press. "The Orchestra of To-day," by Mr. Sidney Lanier is descriptive of the differences of construction of the best-known musical instruments. The difficulties of counting time and of directing an orchestra, and the desirability of encouraging women to devote themselves to this department of music, are incidentally discussed. "Eighty Miles in Indiana Caverns," is an account by Mr. H. C. Hovey, of explorations in Sibert's and Wyandot Caves; "Rocky Mountain Mules," by Mr. Ernest Ingersoll, is an illustrated paper of fun and adventure, not without practical information for those who are Westward inclined. An interesting anecdotal biography of Jules Michelet, the historian, is contributed by Mr. J. D. Osborne; a short story by Mrs. Julia Schayer is entitled "A Summer's Diversion." The Poetry of the number includes a narrative poem, "Fra Luigi's Marriage," by "H. H.;" "The Tornado," by Charles de Kay, and poems by Dora Read Goodale and Violet Hunt, the latter being an English girl of seventeen, who is thought, by famous English poets, to have very decided poetic genius. This is her first published poem.

The departments, though not quite so full as usual, have a number of features, including Doctor Holland's "Lay Sermon for Easter." Mr. J. Watts de Peyster writes about "The First Breech-loading Rifle." "Operas for Amateurs" are treated of in "Home and Society." To "Bric-a-Brac" Mr. W. J. Linton, the engraver, contributes a modern idyl in the style of a distinguished poet, entitled "The Princes' Noses," and apropos of the supposed tattooing of the sons of the Prince of Wales.

St. Nicholas.—Opens with an illustrated account of a boy's "Adventure on an Egg Var," in rescuing his baby sister from an eagle. There are five other short stories, all illustrated. There is, also, an illustrated account of the exciting Mexican and Cuban game of "Kite-Cutting," besides a description, with six pictures of the beautiful "Dead City," Pompeii, and a story, with full-page illustration, of how they used to celebrate 'Easter in Rome." The frontispiece, "A Burial at Sea," is an engraving on wood, after the picture by Henry Bacon,—the painting which attracted attention in last year's Paris salon. Miss Alcott's serial, "Jack and Jill," takes its boys through an exciting debate, and its girls into a grand tableau; and Mr. Stoddard's "Among the Lakes" comes to a close with a long installment full of fun and movement. Besides other poems, there are: a quaint two-part dialogue for girls; a stirring ballad about "St. George and the Dragon;" and a lullaby by Mary Mapes Dodge, set to music by Hubert P. Main. The pages set apart for very young readers and for the departments—"Jack-in-the-Pulpit." "Letter-Box," and "Riddle-Box,"—are full of novel and amusing items.

The Domestic Monthly.—The issue of this favorite magazine is interesting to those preparing for the opening season. The spring styles are well defined, and as a rule simple. Even the more elaborate designs owe their apparent richness more to combinations of material than to any technical peculiarities beyond the skill of amateurs. These conditions are favorable for dress-making at home. The frontispiece of the present number presents a street costume which abounds in suggestions for the ingenious, as it may be made with one color and one material, with very little trimming, or with the blended effect of different materials and colors. Among the other illustrations will be found much that is new and tasteful. Basque designs, evening and reception dresses, polonaises, overskirts, wraps, coats and dolmans are shown in great variety, with special costumes for all occasions.

The Literary Department affords, as usual, a carefully selected range of contributions, from the best authors.

Good Company has an account by Charles Dudley Warner of a 24 hour expedition by the well-known Adirondack guide, and himself, over an Adirondack mountain near Keene Flats. The stories include a tale of the South Pacific by Edward Bellamy, and Through a Needles Eye, by Katharine Carrington. The sketches will be particularly enjoyable to lovers of nature. Geo. M. Towle sketches John Bright; and Mrs. Wager-Fisher tells of Ernest Renan, author of the well-known Life of Christ. The other articles include Wanted, by Mrs. Edward Ashley Walker; The Defense of Criminals; Some Frontier Art; besides poems redolent of spring, entitled Fairfield's Brook, Tokens, and Alder Blossoms. The editor has something to say about Mr Ruskin, takes up the cudgels in behalf of a little child's poem, by Tennyson, and gives other articles and also book reviews This number opens a new volume of Good Company, which is published at $3 a year, in Springfield, Mass.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

PEN-THOUGHTS FROM EVERY-DAY HOUSE.

MRS. ANNIE L. JACK.

THE season advances and soon we expect to be busy. Already summer garments are out for repair, and I am confronted with the semi-annual question of—what to wear. In a large family it is one of vital importance, and I often envy those mothers who seem to have a natural talent for fixing over to greater advantage than I find my own skill equal to. I am sure there are many readers who will sympathize with me, and I often think it would be a fine subject for an artist—to depict the chagrin with which we all look at the outgrown dresses and sigh "Too short"! wondering if they can be let down, or kilt-plaited in any way that will insure them another season's service. And while proud to see the children grow, does not a little pang steal to our hearts, that is so charmingly expressed in Louise C. Moulton's poem, "If I Could Keep Her So"?

"Blue eyes learning wonders of the world about
Here you come to tell them—what an eager shout!
Winsome little damsel all the neighbors knew;
Thus I long to keep you, for I love you so."

But grow they will, and soon the little boy or girl is beginning to assert his or her own opinion, to form views of men and things and to require more from you in the matter of appearance than in the early days when a yard of cloth was enough for a shirt. But with increasing cares, the children will be increasing help. The boys, if taught early, can sew on their own buttons, and darn their stockings much to the relief of mother and sister, who will be wise to give them thread and needle-book at some opportune time, with their initials worked upon the cover. This appeals to a boy's pride and will be useful to him in after life, when, perhaps, he may be out in the world—where "mother" cannot be. How one's thoughts wander! and all this time I am confronted with a pile of little frocks and jackets too short in the sleeve or skirt, and must apply to the piece-bag for help—and for awhile lay aside the pen and let the needle have full sway.

LOG-CABIN SKETCHES; OR JESSIE SEABRIGHT'S DIARY, NO. 11.

MAY MAPLE.

JAN. 10, 18.—It is strange how much one can accomplish when one has a will to do so, and still more strange how little money can suffice to make a family comfortable, and happy. And yet so many go complaining all their lives because they have none of the comforts of this world, and must always live in dark, dingy houses, with bare floors, bare walls, bare windows, and a general appearance of dilapidation and destitution. I can't help thinking that one must be particularly unfortunate, who is under the actual necessity of living in such utter poverty. Our own cabin home is not furnished with such luxuries as wealth might bestow; but our neighbors count us among the well-to-do farmers, although our farm numbers less acres than many others. We seem to have things in the house more comfortable than the average farmers; and yet there is nothing the rest might not have, if they would take hold of the matter with energy. But it is easier to say, "I wish I could afford to have so many conveniences about our house; but I don't have time for such fixin's," than it is to go about the work.

My last achievement I am particularly proud of; for I am writing in my new kitchen, which is a good-sized room, and adjoining is a cozy bed-room and a small pantry. And there is a good sleeping-room above. I earned the materials, and John put them together. I made rugs, counterpanes, comforts, did some tailoring, made some toys for the children's holidays, crocheted some fancy edgings, and embroidered some handsome tidies on Java canvas. Not many moments were spent in idleness after I made the resolution to enlarge our borders. When I needed rest I took it. For what luxury would be even a comfort, if I worked myself sick. Neither did I let my mind go starving for its usual rations of intellectual food. I kept my health good and systematized my tasks; and for once Fortune or Providence favored the brave. My friend, Mrs. White, often assisted me to sell my wares, by finding purchasers among her more wealthy acquaintances.

The villagers down by the mill were often glad to get work done, and were willing to pay fair prices; and thus I added a little here and a little there to my purse, the contents of which were hoarded up and counted over and over very much as a miser hoards and counts his gold. At last I had $40, which John thought would be about the expense of lumber and materials, and he would do the work. He said it would not be worth while to go to much expense, for the old log house would not stand many years more, and we had better save our strength and means for something better.

The inside is lined with building paper, instead of being plastered, and then covered with wall paper of a very light drab, and looks as pretty as tinted plaster, and the wall is about as warm as a plastered wall. The windows are large and low, and this particular feature makes the room look especially inviting and cheerful. Now we are somewhat prepared for sick days, that are liable to come to us all sooner or later. Of course, we hope they may still be afar off.

We are resting now and laying plans for the coming season, which we mean to make as prosperous as the last, providential circumstances permitting.

OIL-CLOTH AND CARPETS.

I HAVE tried painting old pieces of rag-carpet, and must say they are not worth the oil and paint put on them. They absorb a great deal of oil and are hard to clean. They are not as good as the carpet without the paint, and will not last as long. Without the paint they may be easily cleaned so as to look nice, by pounding them through good suds and rinse water. If desired to be stiff, they may be starched with flour starch and ironed.

Good, thick cotton drilling or thick, firm cloth may be made into oil-cloth by stretching on a frame and painting. The cloth should be new and strong, or it will not be worth the trouble.

I have tried knitted carpets, as highly recommended a few years since, and must say they are not the carpets needed, and will wear but a very short time. When one wants rag-carpets, it is best to purchase warp and take the rags to a weaver who knows how to weave good rags and warp into substantial carpets; and one will be paid for the labor and expense put on them. Very coarse-threaded rags or tender ones may be cut in strips from one to two inches wide, braided and sewed together for mats or rugs to place where needed.

H. E. S.

JELLY FROM CIDER.

In the RURAL of March 13th, E. R. Shankland asks for the experience of others in making jelly from cider. Having made it for many years successfully, I submit the following:—Bring the cider from the mill as soon as pressed; place the barrel in position for drawing, and let it stand over night. Take a clean brass kettle that will hold from three to six pailsful; adjust it for boiling; fill, and it is ready for the fire. Skim thoroughly when it commences to boil. Don't add any more cider to this kettleful if you want clear, nice jelly. Boil steadily and continuously. When nearly reduced, dip out a few spoonsful into a basin and place it in cold water to try it. Boil it until as thick as common jelly when cold. It may be kept boiling so that it is nearly to the top of the kettle until the last hour, when the coal, swith a few chips added occasionally, will be sufficient. As soon as thick enough, remove from the fire and dip immediately into stone crocks or jars. If it be allowed to cool in the kettle, it will injure the flavor. It is not liable to burn if you keep it over a steady heat until done. HARVEY MORGAN.

IN answer to inquiry about apple jelly, I would say that a copper evaporator is the only thing that it can be successfully made with, and the "Cook Pan" we think the best. Any kind of clean, unfermented cider will make jelly, except that which is very sweet; that is, that made from very sweet apples which will only make molasses. Two-thirds of sweet and one-third of slightly tart apples make the best quality of jelly and while Rambo or Belmont apples make very good jelly it is much better to add one half of some good quality of sweet apples. The better the quality of the fruit from which the cider is made the better the jelly. D. M. SPONTZ.

DOMESTIC RECIPES.

Rhubarb Jelly.

Prepare as for sauce, cutting up into small pieces. Put into a preserving kettle with a very little water. Boil until very soft. Drain through a sieve; then press through a jelly bag. To every pint of juice allow one and one-half pound of sugar. Boil the sugar by itself until nearly ready to form candy and then mix with the juice. Boil together moderately, keeping well skimmed until the jelly falls from the skimmer in sheets. Put away same as any other jelly. M. L.

Old-Fashioned Indian Pudding.

One quart of buttermilk; two eggs; a few dried berries and a teaspoonful of saleratus. Stir in Indian meal to a stiff batter. Boil two hours in a pudding bag, with a piece of salt pork in the water.

Good Doughnuts.

Take a quart of new milk and one cup of hop emptyings, and prepare the same as for bread. When light, add half a pound of sugar, half a pound of butter, three eggs, a little salt and a pinch of soda. Cut square, and fry in hot lard. Season with nutmeg. A. L. G.

QUESTIONS ANSWERED.

Mending Rubber Boots.

B G. J., Decatur, Ill. Please see directions for mending rubber boots in RURAL of March 13, page 175.

To Banish Fleas.

Do you know of anything that will drive away fleas from a house? We have taken up carpets; used salt, lime and other remedies without effect. C. DUNCAN.

ANS.—Try oil of pennyroyal.

To Sweeten Lard—A Frowy Stone Pot.

Will you please tell me what will sweeten lard that has been kept over, also what will remove the odor of frowy butter from a stone pot. MRS. M. N. WAIT.

ANS.—1. Make a weak lye of wood-ashes, settle well, draw off and put it with the lard into a kettle over the fire. When it boils take from the fire, let cool, remove the lard and boil over a moderate fire, skimming off all impurities until no more arise, when it is done. In many cases two or three good-sized potatoes sliced and cooked in the lard until brown will remove all unpleasant flavor. 2. Fill your stone crock with sour or sweet milk, renewing once or twice, after which wash well and sun.

Abner J. P., Wichita, Kansas, asks how cucumbers are pickled by the barrel in the factories with whisky vinegar. He has a barrel of choice pickles in brine, but to buy vinegar there at 35c. a gallon and sell pickles and vinegar at 30c. a gallon won't pay.

These old people whose blood has become thin and steps feeble are praising Hop Bitters for the good they have done them.

New Publications.

Novello's Music Primers.

1.	**Rudiments of Music,** *Cummings.*	50c.
2.	**Art of Pianoforte Playing.** *Pauer.*	$1.00
3.	**The Organ.** *Stainer.*	1.00

SOUTHERN STATES.

Virginia.

(Continued from page 237.)

PAINESVILLE, Amelia Co.—We had an unusually mild winter up to the first of March, but since then we have had rain after rain almost continually, which has kept the ground in bad order. Wheat—of which there was sown a larger area than usual—is looking well generally, except on low, damp lands, or where it was not properly drained. We have had several frosts of late which, I fear, have killed much of the fruit and many of he tobacco plants. Tobacco is now bringing better prices than last year at this time, and farmers are preparing to put in quite a large crop this year. Most of the oats were sown in February and the beginning of March, and are up. Some farmers, however, have not finished sowing in consequence of wet weather. The prospects are good for a late spring. J. W.

Kentucky.

SPEARS, Jessamine Co.—The winter has not influenced the wheat, but it shows some sign of disease, which I think is caused by the Hessian fly. I do not think its general appearance will compare well with that of other years, it looks dwarfish and spindling. It is almost too forward, I am afraid, for late frosts. More wheat was sown last fall in Kentucky than in any year since it has become a State. J. E. S.

WOODBURRY, Butler Co.—The winter has been very favorable to wheat. It is looking fine, except on rolling land where it was badly washed by the February rains. The acreage is a little over an average. I have not heard of a Hessian fly in this section for years. J. B. E.

Louisiana.

NEW IBERIA, Iberia Parish.—A large portion of the corn crop is planted and cotton planters are ready to go to work. The sugar cane is fine this season, and the prospects for a good crop are very flattering. Cotton and cane, it is expected, will bring a fine profit. Very heavy rains just now are hurting the young crops somewhat. A. E. G.

Texas.

SALADO, Bell Co.—Wheat came through the winter all right. No sign of any disease yet, or of having been harmed by the Hessian fly. Its general appearance is above the average of several years at this time. The acreage is greater than for several years past. E. G. M.

Canada.

LONDON, ONT., Canada.—Wheat here has felt the want of its usual winter coat of snow; but as the ground has not been frozen to any depth, there has been no material injury. There is no disease. The Hessian fly has not put in an appearance. There is reason to expect a fair average crop. The acreage is about one-third larger than in previous years. It had begun to put on a spring-like appearance, but the subsequent cold will probably retard its growth a little. R. S. W.

NEWRY STATION, Perth Co., Ont.—We had an unusually mild winter here, with hardly any snow, and when it came it was only two or three inches deep and lasted only a day or two. Fall wheat has suffered a good deal. Cattle are looking pretty well. There is plenty of rough feed for them and abundance of hay, worth from $5 to $6 per ton. Grain in this section is nearly all marketed, and farmers are looking hopefully to the dairy business expecting to realize better prices the coming season than last. Sheep are selling high this spring. A. J. C.

News of the Week.

AGRICULTURAL NEWS.

Monday, April 5, 1880.

IN Holland here are 12 large factories for the manufacture of oleomargarine. These receive the raw material from this country, and require every week from 50,000 to 60,000 tubs, each containing about 30 pounds' weight—in other words they turn out from 150,000 to 180,000 pounds of the product weekly.....Cattle are dying in many parts of England of rot, just the same as sheep.... ...Many ewes are dying there in lambing, still more of rot.....It is estimated that 75 miles of vessels carried grain from this country to Europe last year, and 25,000,000 more bushels were sent than ever before .....In Ireland farmers whose annual valuation is under £15 and above £4 get as much seed potatoes as will plant half an acre and as many oats as will sow an acre; holders whose valuation is under £4 get enough potatoes to plant a quarter of an acre; but in no case must the value of the seed to any farmer exceed £5. All seeds are to be sold at cost, half the price to be paid next November, and the other half a year later without interest.... ...The steamer Hindoo with grain in bulk from this city to Hull, England, was lately abandoned in a sinking condition at sea, as her cargo had shifted. Three officers and 200 head of cattle lost.....Mr. Jas. N. Lee, Editor of Bell's Messenger, the well-known English sporting and agricultural paper, died on March 11, at the age of 72.....In Uruguay one man owns 3,000,000 sheep and lambs and 250,000 cattle! Where are you, Texas?.....In the Burrawang district in New South Wales, the Messrs. Edols lately got 466 tons of wool from one clip of their 206,000 sheep. The fleeces of the dams averaged 8¼ pounds, those of the wethers, 6¾ and those of the breeding ewes and lambs, 4 pounds, making a general average of 5 pounds....It is estimated there are from 484,000,000 to 600,000,000 sheep in the world, or at the lowest estimate 320,833 miles of sheep, if strung out one closely following the other, or nearly enough to encircle the globe 13 times.....The Mark Lane Express thinks England would be no worse off if every Duchess Short-horn left the Kingdom. ....There is a prejudice just now against the use of mutton in Great Britain, owing to the prevalence of liver rot among sheep. Extensive seizures of carcasses rendered unfit for human food from an advanced stage of the rot, are being constantly made in the chief towns and destroyed by the Health Officers. ..... The fourth annual meeting of the Northern Iowa Butter and Cheese Association was held at Monticello Feb. 25-27. Oleomargarine was bitterly denounced; herds are being weeded out of unprofitable cows giving less than 5,000 pounds of milk a year....At the late meeting of the breeders of Holstein cattle held at Syracuse, N. Y., the following officers were elected: President, E. A. Powell, Syracuse; Vice-Presidents, Hon. G. S. Miller, Poterboro; S. Hoxie, Whitestown; Thos. B. Wales, So. Framingham, Mass. Secretary, Chas. Houghton, Boston. Treasurer, Wm. Brayton, Syracuse. A milk standard was adopted for the breed....Cattle are dying of starvation throughout most of Texas....In Oregon, it is reported that nearly half the herds either have or must perish for want of food. Colorado and Utah cattle, too, are dying by thousands....The Ga. oats crop is reported to be suffering from rust. ...Ga. buys 120,000 tons of commercial fertilizers this year—estimated....Recent frosts have inflicted an estimated loss of $2,000,000 on crops about San Antonio, Texas—all fruits and vegetables have been destroyed....J. B. Killebrew, Com of Agr. of Tenn., has received 30,000 applications for documents relating to the resources of the State, since last Oct. A heavy immigration expected....The "New England Aricultural Society" offers a munificent premium of $50 for the best crop of sugar beets for sugar-making grown upon not less than two acres in New England. Address B. P. Ware, Marblehead, Mass....Detroit has 700,000 bushels of wheat on vessels ready to sail....A heavy immigration of Canadians into this country. Sixty or seventy a day are leaving the country around Montreal for the Far West

Voice of the People.

R. V. PIERCE, M. D.:—I had a serious disease of the lungs, and was for a time confined to my bed and under the care of a physician. His prescriptions did not help me. I grew worse, coughing very severely. I commenced taking your Medical Discovery, which helped me greatly. I have taken several bottles, and am restored to good health.

Yours respectfully, JUDITH BURNETT.

Hillsdale, Mich.

THIS is to certify that R. S. White & Co's. Natural Butter Color was awarded the first premium at the International Dairy Fair, New York, Dec., 1879; that the decision of the judges was unanimous for the above-named coloring, I will further certify that the agent of Wells, Richardson & Co, used, or tried to use undue influence with the judges when we were examining their coloring, sufficient to throw their coloring out of competition with other coloring, if the rules of the Fair had been strictly observed. (*Signed*) JOHN STEWART, Chairman Committee on Butter Color, International Dairy Fair Association, December, 1879.

Anamosa, Iowa, March 12, 1880.

AN EXTENDED POPULARITY.—Each year finds "*Brown's Bronchial Troches*," in new localities, in various parts of the world. For relieving Coughs, Colds, and Throat Diseases, the Troches have been *proved* reliable.

Paralytic, nervous, tremulous old ladies are made perfectly quiet and sprightly by using Hop Bitters, daily.

Ex-President Martin Van Buren was made comfortable by the use of Jonas Whitcomb's Asthma Remedy.

Fertilizers.

Bone ash is nominally quoted at about $22 per short ton, on the basis of 70 per cent. phosphate of lime. Bones quoted at $22 50@$23 for Texas and South American mixed, and $25@$26 do. for shin and shank bones. Refuse bone black at $21@$22 per short ton on merit. Sulphate of ammonia at 3½c. ₱ pound on the basis of 26 per cent. of ammonia. Dried blood at $2@$2 30 per unit of ammonia short ton. Ammonia, axoline, etc., for the former at $2 62½@$2 75 per unit of ammonia, and about $2 25 do. for the latter, all short ton. Nitrate of soda, 4½c. Saltpetre, crude 6¼@6¾. The above are wholesale prices; at retail, goods are delivered at boat or cars at the following rates: pure ground bone 47 to 50 per cent. bone phosphate and 3 to 4 per cent. ammonia, $35@$40; dissolved bone black, 15 to 17 per cent. of soluble phosphoric acid $30@$35; dissolved bone 13 to 14 per cent. of available phosphoric acid $30; ammoniated superphosphate 10 to 11 per cent. of soluble phosphoric acid, 3 per cent. of potash, 3 per cent. of ammonia, $40@$45; German potash salts, 25 per cent. of sulphate of potash, $15@$18 per ton; muriate of potash, 80 percent. 2@2½c per lb. land plaster 7.50; dried blood, 10 per cent of ammonia. $35@45 per ton; fish guano dry and ground like. 10 to 11 per cent of ammonia, 20 per cent of available bone phosphate, $40@45; fish guano, 8 per cent of ammonia, $45; unground fish guano, 6 per cent of ammonia, $25; castor pomace; $19@24; sulphate of soda ground, and in barrels, $15@18 per ton; sulphate of ammonia 4½c. ₱ lb; bone black, 70 per cent of bone phosphate, $30@32; ground South Carolina phosphate, 57 to 60 per cent of bone phosphate, $20 per ton; No. 1 Peruvian guano, 10 per cent ammonia, standard, $55 per ton; Lobos $16 per ton; rectified $65 per ton; guaranteed $56 per ton; nitrate of soda, 5¼@5½ ₱ lb.

FORRESTER'S potato manure, $47.50; cabbage, $50; oat, $47.50; lawn dressing, $47.50; turnip, $52; grass, $45; hop, $47.50; strawberry, $42.50; wheat, $45; rye, $47.50.

STOCKBRIDGE'S manures quoted: Potato, $50; cabbage, $50; strawberry, $40; corn $45; seeding down, $40; orango tree, $35; onion, $50—per ton each.

MAPES'S complete manures for clay soil, $25.50 per 1,000 lbs.; for light soils $23.50 per 1,000 lbs.; "A" brand for general use, $20 per 1,000 lbs.; fruit and vine, $18.50 per 1,000 lbs.; cabbage and cauliflower, $23.75 per 1,000 lbs.; corn, $24.50 per 1,000 lbs.; potato, $24 per 1,000 lbs.; asparagus, $25.50 per 1,000 lbs.; gypsum, Nova Scotia, ground, ₱ ton, $7.50.

BOWKER'S "Hill and Drill Phosphate" $45; Bowker's Phosphate $40 ₱ ton, cash: Bowker's "Food for Flowers," 35c. ₱ package and $3 ₱ doz.; Bowker's "animal meal for fowls," $2 50 per cwt.; Ground oyster shells, $1 ₱ cwt.

BAUGH & SONS' prices for goods delivered at depot or boat, in bags and in 2,000 lb lots: Ammoniated dissolved bones, $35; pure bone meal, from raw bones, $36; Baugh's raw bone superphosphate $40; Baugh's $25 phosphate, $25; Baugh's A. A. nitrogen, 13½ per cent. of ammonia, $48.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, April 3, 1880.

BEANS AND PEAS.—The demand for beans is only about strong enough to support tame rates. The season is advancing and the call may relax at short notice, and holders are free sellers of all grades off from extra. Black beans begin to find a market abroad. Wis. green peas unchanged; $1.75@1,80. The lower rates for Southern B. E. peas do not stimulate trade; 2 bushel bags quoted, $1.90@2. The crop of green peas for 1879 was about 25,000 bbls.: three-quarters of which was handled in New York. Marrow beans, prime, $1.55@1.57; other, $1.40@1.50; medium, prime, $1.40@1.42; other, $1.30@1.35; pea, $1.45@1.65; white kidney, $1.60@1.75; red do., $1.40@1.50; black or turtle soup, $1.95@2. California lima, $5.

Receipts of beans for week, 5,500 bush.: exports, 1,450 pkgs.

BEESWAX.—There is a small business only, with 24 to 25 quoted for Western and Southern.

Exports for week, 17,042 lbs.

BUTTER.—Buyers are directing their attention chiefly to new. This class of stock is variable in quality as supplies increase, and prices are somewhat irregular, not more so, however, than is customary at this season, and at a time when scarce good old creates a hurry on the part of spring shippers to realize. As before, choice express lots sell upon arrival, and some marks ahead. Poor lots—and it is a short jump from fine to low quality—are the more difficult with buyers the longer they miss sale. The tone of the market for new is lower. Old State is quite closely concentrated and is going out well quality considered. The range for State is 23@29c. for useful to best; 20c. very poor; for Western poor to prime 20@26c.

New butter, creamery choice, 35c.; fair to prime, 30@34c.; poor 25@28c.; State, pails and tubs, choice, 30c.; other 25@28c.; imitation Western creamery 25@30c.; fresh Western factory or dairy 27@28c.

Receipts for week, 15,780 pkgs.; exports, 1,630 do.

CHEESE.—The market is without marked change. There is more doing on home trade account; export demand is very slack. The readily diminishing supplies exert firmness. Prices are:

Quotations—State factory: best at 14¼@14½c.; good to prime at 13¾@14¼c.; fair to good at 13¼@13½c; do. poor at 12@12¾c. State farm dairy: good to prime at 13¾@14c.; fair to good at 13@13½c. Ohio factory: Cheddar, fine, 14c.; do., fair to good, 12¾@13¾c.; flat, fine, 14@14¼; flat, good to prime, 13@13¾c.; flat, fair to good, 12¾@13c.

DRIED FRUITS.—In apples there is a good demand for evaporated lots, for which prices are very strong. Peaches are steady in price and demand fair. Small fruits are quiet. N.C. apples, fair to good, 7¼@8½c.; choice, at 9@10c.; fancy at 10@10½c; Virginia, at 7@8c.; New York state quarters sliced at 7¼@8¼c.; patent tent evaporated, choice in cases, at 14½c.; good and prime at 13¾@14c.; evaporated, choice sliced at at 13@13½c., and good to choice do. at 12@12½c. Evaporated peeled peaches, good to choice, at 27@28c.; North Carolina peeled, fancy, at 20c.; choice old at 17@18c.; Georgia prime at 16@17c.; fair to good at 14@15c.; common at 10@12c.; unpeeled halves at 7½@8c.; do. quarters at 7@7½c. Pitted cherries at 15@18c. Blackberries nominal at 14c. bid. Raspberries at 27@28c. Plums at 17@18c.

Exports for week, 61 bbls. apples.

COTTON—Has been in active demand and closed firm at for April, 12.79@12.80c.; May, 12.91@12.95c.; June, 13.09@13.10c.; July, 13.20@13.21c.; August, 13.27@13.28c.; September, 12.91@12.96c.; October, 12.13@12.15c.; November, 11.77@11.80c.; December, 11,74@11.76c.

EGGS.—Receipts for the week, 17,780 bbls.; do. last week 21,023 do. Easter week did not carry off the amount of stock calculated upon; and continued free receipts added to the unsold supply of last week, have kept prices low. If receipts moderate, dealers feel that prices will not further decline. Goose and duck eggs have fallen seriously. Southern eggs not attractive. The South must improve their breeds of hens.

Near Points, ₱ doz., 12@12½c.; State and Penn. 11@11½c.; Western, fresh, 11c; Southern, 10@10½c.; under grade lots, 9@9½c.; duck, 18@20c.; goose, 25@30c.

FLOUR.—The receipts are very fair, and with the lower tendency of wheat, prices have declined and closed weak. Latest prices are $4.20@4.90 for poor to choice superfine State and Western; $5.00@5.25 for inferior to good extra do., odd lots and lines; $5.25@5.50 for very good to very choice do.; $5.00@5.25 for inferior to good shipping extra do., and $5.25@5.50 for good to very choice shipping extra do.; inferior to very good white wheat extras, $5.45@6.25; very good to fancy do. at $6.25@7.50; red and amber winter wheat, inferior to fancy trade and family, at $5.40@7.25; round hoop Ohio, $5.15@5.60; and trade and family brands of do. at $5.60@7.25, the latter rate for very choice; St. Louis at $5.50@6.25 for inferior to very good extra; $6.25@7.50 for very good to very choice; Minnesota clear, inferior to fancy, at $5.10@6.50; Minnesota "straight," inferior to very fancy, at $5.65@7.50, and patent inferior to fancy at $6.25@8.50; unsound stock at from $3.25@5.75; city mill extra at $6.00@6.50 for fair to fancy West Indies; do. for England, $5.00@5.40 for poor to choice; do. trade and family extras, $6.50@7.25; do. for South America, $6.25@6.75; No. 2 at $5.00@4.00 for poor to very choice.

GRAIN.—The exports of wheat the past week have been 840,000 bush; large receipts and easier Liverpool markets have tended to lower prices. Latest sales were of No. 1 white at $1.31½@1.31¾; do., April, at $1.31¾@1.32; do., May, at $1.29¾@1.31¾; ungraded white at $1.30; No. 2 red at $1.35¾@1.37; do., do. April option, at $1.36@1.37; do., May at $1.31¾@1.35½; ungraded red at 1.33¾@$1.34; mixed winter at $1.33@1.33¾; No 2 Chicago spring at $1.27; No. 2 Northwest, May, at $1.26¾@1.27¾; No. 3 spring at $1.20@1.21¾. Rye quoted at 90@92c. for State. Corn has been in very large receipt and has ruled much lower, leading to an active export business, and the shipments for the week reach 1,350,000 bush. Latest prices are of New York No. 2, regular inspection, at 54@54½c.; do., April, at 53¾c.; do., May, at 49c.; do., June, at 47¼c.; New York steamer mixed at 53¾@54c.; ungraded mixed Western at 53@54¾c.; No. 3 at 53¾@53¾c.; low mixed at 53¾@54c.; steamer mixed at 51¾@53c.; No. 2 white at 56¾@57c.; steamer yellow at 54¾@55c. Oats are in active demand and closed firm; latest sales are of No. 1 white at 44@44½c.; No. 2 white at 41¾@42c.; No. 3 white at 40@40¼c; New York No. 1 at 40c. bid.; New York No. 2 at 40@40½c.; do., May, at 39c.; New York No. 3 at 39¾@41c.; ungraded white Western at 41@45c.; ungraded mixed western at 39@41c.; white State at 44@46c.; mixed State at 42½@43c.; No. 2, May, at 49¼c,

HAY AND STRAW.—Receipts are larger, but demand is very fair, and prices not showing important change.

Shipping hay quoted at 70c.; retail lots at 75@80c.; for medium, and 85@90c. for prime; clover at 55@60. Straw at $1@1.05 for long rye; 65@70c. for short rye, and 50@60c. for oat.

Exports for week, 1,537 bales.

OIL CAKE—Western is quoted $30 ₱ ton.

POULTRY AND GAME—Dressed poultry brings good prices for the small wants of the market. Frozen at the moment sells quicker than fresh dressed when prices are about equal.

Turkeys, choice, frozen, small 15@16c.; small, fresh 15c.; medium, 13@14c.; fair to good, small, 12@14c.; large, 10@12c.; Phila., dry-picked, 14@15c.; capons, Phila large, 21c; small, slips, 16@18c.; chickens, winter large, Phila., 22@23c.; Phila. small, 24@25c.; spring, 30@35c.; fall, Phila., d.-p., 16@18c.; yearling, Phila., d. p., 13@14c.; N. J., ₱ lb, 13@14c.; fowls, Phila., d.-p., 12@13c.; N. J, good to prime, 12@13½c.; State good to prime, 11@12c.; Western, good to prime, 10@11c.; poor to fair 9@10c. Ducks, Phila d.-p., 19@21c.; N. J. 17@19c.; State, 15@18c.; Western 14@17c.; Western, poor, 10@12c.; squabs, white, ₱ doz., $3.50@4.00; dark, $1.50@2.50. Live poultry in liberal supply and easy sale fair. Spring chickens, 60c@$1.00, pair; fowls, 9@10c.; roosters, 5@6c.; ducks, 60c.@$1.00; geese, $1.75@2; fancy N.J. State and Pa., $1.50@1.75; Western, mixed, $1.25@1.50, Western, white, 75c.@$1.25; pigeons, 35@45c. such items of game as remain have lost their attraction and prices are easy; ducks regarded well sold at this late date at quotations. English snipe, $1.25@1.50. Wild pigeons, $2; canvas back ducks, Havre de Grace, $1.75@2, other, 75c.@$1.25; redhead, 50@75c.; Mallard, Western, 50@55c.; Southern common ducks, including teal and Mallard 20@40c.

PROVISIONS.—Hog products have ruled weak and fairly active; Mess pork closed at $11.10 for new, and $10.90 for old; $11.30 for new April; $11.32½@11.35 for May and $11.40 for June. Bacon at 7¾ for long clear and 7¾c. for short clear. Lard—Western steam at 7.57½ for spot, 7.55@7.57½ for April; 7,57½@7.60 for May, and 7.62½ for June. Stearine at 7½c. for Western. Tallow at 6¾ for prime.

Receipts for week, pork, 1,550 bbls.; beef, 296 pkgs.; brown and cut-meat, 34,870 pkgs; lard 18,970 pkgs. Exports, pork, 3,858 bbls.; beef, 2,600 pkgs.; bacon and cut-meats, 15,256,254 lbs.; lard, 8,235,570 lbs.

VEGETABLES.—Exports of potatoes for week 3,078. Potatoes very dull with a large supply to be yet moved. Prices weak. Southern truck has a more extended sale, but prices have to favor new buyers.

Potatoes, Bermuda, new ₱ bbl., $6.50@8.50; Florida, new, prime, ₱ bbl. $5@7; poor to fair $2.50@3.50. E. Ross, N. S., bulk, ₱ bbl. $1.35@1.37; Maine, per d.-h. bbl., $1.75@1.87; State do. $1.25@1.50; State, in bulk ₱ bbl., $1.25@1.50; prolific N. S., per d.-h. bbl., $1.25@1.37; do., in bulk ₱ bbl. $1.25@1.37; Mercer, Nova Scotia, bulk, per bbl., $1@1.12; Chili red, N. S., bulk, ₱ bbl., $1@1.12; Peachblow, State, white, per d.-h. bbl., $1.75@1.87; do., State, red, per d.-h. bbl., $1.50@1.62; Snowflake, State, per d.-h. bbl., $1.75@2; Peerless, State, do. $1.00@1.25; do., bulk, ₱ bbl., $1@1.12; Jersey, bulk, do., 50@75c.; Sweet potatoes, S. J'y and Del. ₱ bbl. $3.00@3.50. Fla. tomatoes, ₱ box, 50c.@$1.00; Nassau, 30c.@$1; Bermuda, 60c.@$1; do., beets, new, do. ₱ cr. $1.50; Fla. ₱ crate $1.75@2; cucumbers Fla. ₱ crate $3.00@6; string beans, Florida, round ₱ crate, $2.50@3; flat ₱ crate $2@2.50; green peas, Ch'n and Sav., small per crate, $1.50@1.75; Ch'n. and Sav. $1@1.50; Asparagus, Ch'n., per doz. bchs. $7.00@9. kale, Norf., ₱ bbl., 1.00@$1.75; Baltimore, per bag, 90c.@$1; spinach, Norf., per bbl., $2@$2.75; Baltimore, $1.00@2; radishes, Nfk round ₱ 100 bunches 75c.@$1; do. long per 100 bunches, $1.00@1.50; squash, marrow, per bbl., $1.50@1.75; Hubbard, $2.50@2.75; cabbage, Ch'n and Sav. ₱ bbl. $3.50@3.75; Fla., new, per bbl., $3@3.50 do., old, per 100, $5@10; onions Bermuda, new ₱ crate $3.25@3.50; white, ₱ bbl. $4@6 yellow, $3.25@3.50, red, Eastern, $2.75@3.25; red, Chester, $2.75@3.25; beets, Jersey, $1.50@1.75; turnips, Russia, 62@75c.; carrots, $1@1.50. Hothouse cucumbers, selected, ₱ doz., $4.00; other per doz. $1@2; radishes, ₱ 100 bunches $1@2.50; rhubarb $4@6; lettuce, extra ₱ doz. 37c.@$1; fair to good, ₱ doz. 25@75c.; carrots ₱ 100 bunches $3.50@4.

SEED—Clover is moderately active and easy; sales at 6¾@7c. for Western and 7¼@7¾c. for State. Timothy is dull at $3.

TOBACCO.—The business is entirely in small lots on home trade account, with prices without change.

WOOL.—There is more activity and a strong market. Latest sales are of

X and above Ohio at 55@56c.; XX do. at 59@60c.; common and ¼ blood do. at 55c.; Indiana tub-washed at 65c.; fine State at 53c.; medium unwashed Wisconsin at 47c.; fall do. at 24½@36c.; California pulled at 45c.; fall Texas at 32@33c.; spring do. at 36@37c.; scoured Colorado at 78@82c.; Oregon at 45c; foreign carpet noils at 22c.; scoured East India at 53@60c.; 50 bales Cape at 35@37c.; Montevideo at 40@41c.

LIVE STOCK MARKETS

NEW YORK, Saturday, April 3, 1880.

BEEVES.—Receipts for week, 12,189 head; do. last week, 11,235 do. The absence of Jewish buyers owing to a special holiday, made a marked difference in the late attendance of the market, and with few purchasers, sellers had to seek sales. This, of course, put the market in buyers' favor, compared with Wednesday last. It is estimated that many lots lost $50 to $80 per car; common and light stock dragged badly. Colorado still-fed brought 9@9¾c.; common to fair steers, 8@9c., dr. 55@56 lbs.; good to prime, 9¼@10c.; dr. 56@57 lbs.; Some extra heavy cattle for export use cost 11@11¼c., dr. 56@57 lbs. The shipment abroad for the week has been liberal and varied.

COWS AND CALVES.—The demand is only fair. About one-quarter of the supply sold at a range of $30@50. When the latter price is exceeded the cow is worth quite as much at home. A few common State cows have sold at $25.

VEAL CALVES.—Heavy receipts of live have made low average sales; 7¼c. seldom obtained. Live calves, N. J. and Bucks Co., choice, 7¼@7½c.; prime 6¾@6¾c.; State, choice, 6¾@6¾c.; prime, 5¾@6c.; fair to good, 5@5½c.; poor, 4@4½c.; Mt. Holly, good to choice, 6@8c.; buttermilk, 3@4c.; grass, 2½@3c.

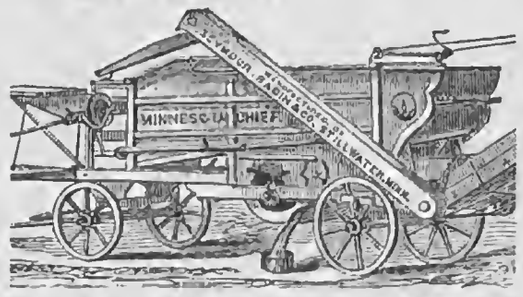
HOG Dressed, N. J., choice, 10c., good to prime, 8¾@9c.; State, good to choice, 8¾@9c.; fair to good, 6@8c.; poor to fair, 4@6c.

SHEEP AND LAMBS.—Receipts for week, 22,160 head; do. last week, 21,134 do. There has been a daily over-stock, and the dull market has had some extra depression, owing to a fall in wool skins. Common to prime unclipped sheep sold at 6@7¾c.; choice wethers only brought 7¾c., and then had been bought ahead. Yearling lambs, 7¾@8¾c.; spring lambs, per head, $4@6. A car-load of Ohio clipped sheep sold at $4.60.

SWINE.—Receipts for week, 31,018 head; do. last week, 27 791 do. Market bare of live; nominal quotations, 4¾@4¾c.

Country-dressed pork, light, 6¾@7¾c.; medium, 6¾@6¾c.; heavy, 6@6¾c.; city dressed, 6@6¾c. Pork tenderloins, 10c.

MINNESOTA CHIEF!



The Best Thresher on Wheels!

It is not a vibrator, neither is it an apron machine, but the best points of both are combined, with new and original features of its own. It is wonderfully simple in its arrangement. It is admirably perfect in its threshing and separating qualities. It saves all the grain, and cleans it ready for market. It runs easily, is constructed durably, is finished beautifully, is the most economical, least expensive, and altogether the most satisfactory machine in the market.

It will handle wet grain as well as dry. In threshing Flax and Timothy it has no equal, threshing and cleaning both as well, and nearly as rapidly, as wheat, and requires no change except the sieves. It has more square feet of separating and cleaning surface than any other machine made, and cannot be overloaded. It is both over and under blast at the same time.

Our clover hulling attachment is a new and very desirable feature. It does the business more rapidly and better than an exclusively clover hulling machine.

Separators of the various sizes fitted for Steam or Horse-Power, as desired.

An Improved Pitts Power, an Improved Woodbury Power, and the Elward Equalizing Power, all mounted on four wheels, are manufactured by us, and are not surpassed by any in the market.

STOCKBRIDGE MANURES
For 1880.

Some years ago the Stockbridge Manures were only known to a few farmers in the Connecticut Valley. Now they are so extensively used in different parts of the country as to require two large factories, one in New York and one in Boston to manufacture them. This increase shows what farmers think of good fertilizers, and is not only due to the fact that they are reliable, well-made, and high-grade manures, but also to the fact that farmers have

FOUND THEM PROFITABLE TO USE.

Now that corn, and other farm produce is bringing such good prices, we anticipate that farmers will invest still more largely in our fertilizers.

Besides the Stockbridge Manures, we manufacture several high-grade Phosphates, and deal in first-class chemicals of all kinds. Farmers who intend to use Fertilizers of any kind, should

REMINISCENCES OF A LITILE GIRL.

MRS. M. J. GALPIN.

CHAPTER IV.

For many weary months they traveled with the surveying expedition, passing through wild, barren and beautiful scenery alternately, now staying by some ruined castle (the abode of some former Irish king), whose walls were festooned with English Ivy and numerous other vines of varied hues; the neglected gardens with here and there the flowers peeping forth, and anon a rose-bush climbing over the ruined walls, all betokened neglect and despair. The former glory had departed and naught remained save the moldering tower and a legendary name. Now and then some old and faithful retainer, who had followed the fortunes of his master through a life-time, might be found living in a little cottage close by, and from this class of people, being fond of story-telling, one could hear the most marvelous tales as to the fame in bygone days of the lord of the castle, before the evil days came, when England interfered and put an end to all their lordly possessions and appropriated all their wealth to fill her own capacious "maw."

I presume nearly all my readers have heard of "Blarney" as attached to the Irish, some being more proficient than others in that accomplishment. Blarney is a village situated about four miles from Cork; in this village is an old castle on the top of which is a large, flat stone, that whoever kisses it, so the legend runs, will always have the gift of an "oily, ready" tongue. The castle is famous in song. The first line in one runs thus:

"The groves of Blarney they are so charming."

I find the following account of the erection of Blarney Castle and give it, as it may interest my readers: "It was built in the 15th century by Cormac McCarthy, surnamed 'Laider,' or the strong. Their ancestors had been chieftains in Munster long before the English invasion. Their descendants, as lords of Muskerry and Clancarty, retained their peace till 1659, when their vast possessions were confiscated and all eventually fell into decay." The scenery around the castle is delightful, and every nook and corner is hallowed by legendary lore. Enchanted cows that belonged to the Irish lords may be seen at night, the story goes, disputing with the cows of the present owners for the luxuriant pasturage, and many an earthly bull has been killed and worsted in the encounter with those from the spirit land. The rings of the "fairies" (so they tell) may be seen any moonlight night from early summer till the end of harvest.

The ready wit of the Irish is an inborn talent, and can be found in the "bogtrotter's" cabin as well as in the homes of the rich. Nearly every one has an aversion to bright red hair, and the Irish always call a person of that color "foxy-head," when the reply comes instantly and without thought, "May you never see the dyer." A gentleman asked a little boy once what made them have so many mountains in Ireland, when he replied, "shure whin they wor makin the world, and they cum to Ireland, they had lots to spare, they just set it down here and there, so as to be handy if they should want it again." Then they tell of the first O'Donaghue, when he was a "slip of a boy,' he was sitting in his nurse's cottage, when she set up a "screech" that "the O'Sullivans were staling the cattle, so up he gets and pulls an ould sword out of the thatch and goes and kills every mother's son of the thaiving blackguards." I wonder if any of my little readers have ever read or heard of an Irish fair. Like fairs of any kind, they are lively institutions, full of fun and originality of character. You will see all grades of people from the lord of the manor in his elegant "turnout" to the poor mendicant begging for alms. Whiskey and fun flows freely. The country people from far and near flock to the fair, some in jaunting cars, some on foot, and some riding on the beast they may want to sell. There is a useful little animal used as a beast of burden in Ireland called the ass (now don't laugh); it occupies there about the same position that the mule used to in the South before the war. They are not much larger than a Shetland pony and some say they are docile and easily managed; but when they become old, like everything in life they are not of much value, and this gives Pat a chance to show his native wit. Taking his old, broken-down animal in hand he proceeds to fix it for a sale; he shines its gray coat, gives it a good feed, and taking his station in the horse market, he cries out its value, enumerating all its good qualities, and putting it through its grand accomplishments. Now this deceitful fellow sometimes carries in his hand a nail, so hid that the buyer cannot see it, and when he wishes to show what a lively ass it is, he strikes it with his hand, of course pricking the poor beast with the nail. The ass jumps and prances wildly under the pain, but smart Pat is quite innocent and says, "whoa! there now, ye wild baste; shure, it's nobody can howld ye at all, at all; look at him, will ye, caperin' round like a young filly; begorra, it's me heart is sore trying to howld ye."

Sometimes a man of the medium or lower class will wear all the coats he has, at one time on his back, while at the fair, and when "for love he knocks you down," he takes one of these garments and hauling it after him, he dares any man that wants a fight, to "step on that coat tail"—the offer is generally taken up, as an Irishman loves a fight as well as he does to eat; then there is a general melee, as the factions of both combatants take sides and the fight becomes general until the priest appears and restores order. But it would take too much space to tell all the funny aspects of the fair. In song, rhyme and poetry the Irish stands foremost. you have no doubt read many a funny Irish piece or song. I now call to mind one about a marriage, of which the first verse runs thus:

"'Twas a fine summer's morning, 'bout twelve in the day.
All the birds 'gan to sing, and the asses to bray,
When Paddy the bridegroom and Norah the bride
In their best bib and tucker set out side by side."

I only wish I could let my little readers hear the jolly air or tune of this song, it would do more to cure sickness than all the pills in the doctor's shop. For love making Paddy stands without a rival. He will use more "blarney" and persude his lady love that the moon is made of green cheese, quicker than any other man under the sun. But after marriage, it is not seldom that he uses his fists to his wife. Yet such an anomaly is woman's nature, that if some well-meaning person interferes in these conjugal rows, he is sure to be whipped by both of them for his kindness.

But how far have I wandered from my subject! I have thus deviated from the main track, to relate what might be of interest to my little friends, as I love to please the children. The memory of my own childish years is still as bright as if it were but yesterday, and how often I remember sitting on the stool at uncle's feet and hear him relate wonderful stories of the "banshee," the "pooka," or adventures of the "fairies" in some sylvan glen. The surveying expedition was long and wearisome, but Uncle Tom by this time had entered the office of the civil engineers as draughtsman, and being, as I said before, a beautiful penman, he commanded praise and good wages for his time. We will now leave them, and in my next chapter we will meet at the famous "Lakes of Killarney," the most beautiful and romantic in the world. Perhaps you'll think my little heroine is never coming, but ere long you will make her acquaintance.

LETTERS FROM THE COUSINS.

UNCLE MARK:—I have not forgotten you although I have not written in a long while. I have been very busy all winter in school and have neglected writing until now. My plants are doing finely this winter and I must say I have not seen any look so well as mine. I had a little Begonia leaf given to me in the fall. I put it in a bottle of water where it rooted, and it has now four leaves and one coming up through the dirt beside it. I have a Calla and a few other plants in a southeast window where they get plenty of light and sun.

I wish the cousins would tell of their pets as well as plants. I have got some pets I think everything of. They are a pair of canary birds and they are quite tame. I got them for a Christmas present. Don't you think it was a very nice present, Uncle Mark? I have a pretty hanging basket and a big ivy that covers one window. It is so twined around the basket that I think I shall have to cut it off in the spring. My window garden is very pretty, there are so many different kinds of plants in it and some of them are about a foot high. I must thank you for the seeds you sent and hope we shall have good luck with them. Father had a large package sent to him from Washington about the time yours came, so we will have quite a time experimenting. No more this time for I believe you send all long letters to the waste basket. Sincerely yours,

Onida Co., N. Y. CLARA WOOD.

DEAR UNCLE MARK:—I do not often see letters from this part of the "Badger State," and have been thinking for some time I would like to join the company of cousins. Will you accept another member? Am going to try gardening this year on a small scale. We live on a farm so I have all the room I want. Don't believe I would like to live in a city. I have several kinds of house-plants. Does an Amaryllis require more heat and moisture than Geraniums? What kind of treatment does a Calceolaria want to have it blossom well? Is Sweet Alyssum easily grown for hanging baskets? I am afraid you will shake your head and say, "too many questions for the first time." Should this be accepted I will write again.

Sheboygan Falls, Wis. MYRTLE.

[The Amaryllis does need a somewhat warmer temperature than Geraniums. Calceolarias are grown for winter blooming. Seed can be sown in the fall. Give the plants rich soil, and change to larger pots several times till they are in five-inch pots. Alyssum may be used for baskets.—U. M.]

DEAR COUSINS:—I see a good many new cousins' letters in the RURAL, and while I enjoy reading their letters, and hope they will write often, I would like to see some from our old time friends. What has become of them all anyway? I read some time ago that Madcap Mollie was keeping house. Now Mollie I have been helping to keep house, too; and although I know it keeps a person busy, I think you might take time to write your cousins a letter once in a while. And our Swiss cousin!—did the briny ocean swallow him before he reached his home. If it did not I wish he would write and tell us about his voyage, and some more about that country. We received the seeds from the RURAL all right, and I am going to try and raise some flowers from them. I did not succeed very well with those we received last year; only four kinds grew, but I think it was my fault instead of the seeds'. I am in hopes that I will succeed better this year.

Crawfordsville, Iowa. NELLIE WILDWOOD.

UNCLE MARK:—We have received our Rural free seeds all right. I put the Magnolia seeds in sand and will plant them as soon as the ground gets warm enough. I have some flower seeds planted in pots in the house, and some are coming up. Papa has had my beds all spaded up and is going to fill them with leaf mold from the woods. I have 18 different kinds of house plants; they are all doing nicely now. Uncle Mark, will you please to tell me where and how I can get some Tea Plants this spring. I will tell you about my Roses in my next, and how I got them. NELLIE.

Hamilton Co., Ohio. [Perhaps the Commissioner of Agriculture, Washington, D. C., will send you a Tea Plant if you ask him.—U. M.]

DEAR UNCLE MARK:—As I like to read the letters from the cousins in the RURAL, I will write one, too, and ask if I may join the happy band. My mother died when I was seven years old, and left me in the care of Mrs. Squires, but I chose to retain my father's name. I am twelve years old. I go to school about half a mile distant. We have quite a good many house plants; among them are seven varieties of Cactus. I have had a flower bed ever since I was nine years old, but will have a larger bed next summer. I must close for this time, and if I see this in print I may write again. So good-bye, with love to all the cousins.

Wyoming Co., N. Y. LUCY L. HALLER.

DEAR UNCLE MARK:—Please put my name on the Club list, and I hope I am not too late for the seed distribution among the members of the Club. Papa has taken the RURAL a little over one year, and likes it very much. He has given me a piece of ground to raise the seeds I get. I am 13 years old and live on a farm near Easton, Md., on the Fred Haven River. I will try and give all the attention I can to my garden, and hope I will be successful with both vegetables and flowers. I will write and tell you how I succeed.

GEORGE W. BAKER.

Talbot Co., Md.

DEAR UNCLE MARK:—I would like to join your Horticultural Club. My father has taken the old RURAL for twenty years and we all like it very much. Mamma has twice got some seeds from the RURAL and also some potatoes. They did quite well. I like flowers very much. This is my first letter to the RURAL. From your niece,

Canaserago, N. Y. MAY.

DEAR UNCLE MARK:—I have been reading some of the young folk's letters and thought that I would write one to you. My age is twelve years. We are to have a large flower garden this summer, to make it a little more pleasant around our new house. My oldest brother takes the RURAL and likes it very much. One of your young friends.

Lewis Co., N. Y. EARNEST G. DODGE.

The Puzzler.

RHOMBOID.

ACROSS: 1. The awn; 2. a portion of land; 3. the tip of the ear; 4. a slattern; 5. obtained from the maple; 6. obliterated.

DOWN: 1. A letter; 2. a prefix; 3. passion; 4. the young of shell-fish; 5. earth; 6. a short dagger; 7. pyramidical; 8. a suburb of Constantinople; 9. a word applied to small girls; 10. an abbreviation; 11. a letter. "GUS."

Waterloo, Ind.

☞ Answer in two weeks.

HIDDEN HOUSEHOLD ARTICLES.

1. It is to ventilate the building.
2. I need Lettie to do the housework.
3. Mab rush to the barn this minute.
4. Tab lets all the mice live in peace.
5. O! vengeance is a dreadful thing.
6. Mary got up late and was tardy at school.

A DOUBLE ACROSTIC.

1. A color; 2. a "Will 'o the Wisp"; 3. the semi-diameter of a circle; 4. dry weather. Initials and finals, four members of the animal kingdom.

☞ Answer in two weeks. LITTLE ONE.

SQUARE WORD.

A cape of Spain. A cape of New England. A number.

☞ Answer in two weeks. L. O.

PUZZLER ANSWERS.—March 27.

BRIEFLETS.

PROFESSOR RUMSEY says: "Large towns are in themselves a monstrous evil—an evil continually growing through wrongful laws or customs. A town of 20,000 inhabitants is large enough for every good and desirable object."

. . "The Chicago Board of Education has adopted a rule which declares that when a young lady teacher marries she will be considered to have resigned her position as teacher." This is rather hard in these days when many young ladies who wish to marry have to reflect whether they can afford to support a husband or not. . . Frenchmen do not often speak of their wives, lest they talk about them before gentlemen who know them better than they do. . . How can he look with confidence to a heaven above who tries so hard to make a hell below! . . A difference:—Alexander Hamilton once said, "Men are reasoning, not reasonable creatures; but women are reasonable, not reasoning creatures." . . Speaking of the baby elephant reminds us that we shall soon have occasion to introduce a White (baby) Elephant to our readers. . . Gains of Cunning—If you win by cunning, you also lose by it—lose that which is more valuable than any object gained by it—character. Thoughts and Events. . . The Sharpless, so far as we have been able to learn, fails in the South. . . Longfellow and Warren are respectively a late and early berry spoken very highly of by the few who have as yet tried them. The RURAL will will be able to report this season. . . The extravagance of a woman's dress gives rise to the suspicion of extravagance of conduct. . . In the spring coughs, colds, bronchitis do their office of disaster: In the spring a young man's bosom finds relief in mustard plaster! . . We learn that immense quantities of the Gregg Raspberry are being sold by nurserymen. . . Love pleases more than marriage, for the reason that novels are more amusing than history. . . Charles Lamb said; "Women owe to us the most of their faults; we owe to them the most of our virtues." . . Mr. Meehi himself says: "When farmers give up the belief that Mr. Meehi is a mere theorist, it will be better for their pockets, and then I shall be much gratified." No doubt. . . La Bruyère says: "I would wish to be a girl, a beautiful girl, from thirteen to twenty-two, and after that to become a man." . . Celery seed may in a week or so be sown in the open ground. It is only needful to keep the plot free from weeds until transplanted in July. It is well also to cut off the tops so as to insure stocky plants. In the latter part of June, prepare the ground thoroughly and plant five or six inches apart in the row—the rows 3½ feet apart. . . "The higher the elevation the lower the degree of heat necessary to boil water" remarked Gen. LeDuc at the Elmira Club. "You all know you cannot cook potatoes by boiling on the top of the Rocky Mountains."

Col. Piollett—"Why?"

Commissioner—"Because you can't get heat enough to cook the starchy matter in them."

Col. Piollett—"That is the first time I ever heard that." (Laughter.) . . "Bredderin," said the old negro preacher, "if we could only see into our hearts as God does, it would skeer us to death! . . The vice of this dispute between labor and capital is that the first is apt to lose its temper, and the last to show its arroganec. They are mutually dependent, and they cannot long separate or disagree without mutual injury. . . Mr. Forney's paper, Progress, says: "Lord Beaconsfield will carry the elections in the next struggle, but he is clearly providing a terrible reckoning for Great Britain in making Imperialism the party gospel of his followers. Adherence to that feudal folly in an age like the present is a crime before God and man, and will surely lead to the independence of Ireland and to the ultimate loss of all the British colonies. Mark the prophecy!" . . Mr. Dalrymple, the farmer of Dakota, will put in something less than 17,000 acres of wheat—not 30,000 as has been stated. The Prairie Farmer makes the correction. . . Incubators have been called Infernal machines by disappointed French people who have returned to the good old way of hatching eggs. . . "THERE'S RUE FOR YOU" is the title of an English novel soon to appear.

Mr. Ranby—You excuse yourself too heavily, my dear. You have sins to be sure.

Mrs. Ranby—(in a raised voice and angry tone); And, pray, what sins have I, Mr. Ranby?

A speculative rise or a speculative fall in prices always outruns intrinsic value. The pendulum goes backwards and forwards, and intrinsic value lies between the two extremes. . . . To some people the times are never ripe, and the fruit of the tree of knowledge is always too green for public digestion. They acknowledge the fruit and the tree whereon it grew; they make no question about that; but the fitness of period and the ripeness of condition perplex them sorely. . . Field peas and oats go well together on rich land. . . It is high time to sow Verbena seeds in boxes or pots to be transplanted later. Seedlings are far stronger than rooted cuttings. . . Few annuals equal in beauty the Sweet Pea. . . Portulacea, Petunia, Pansy, Mignonette, Phlox Drummondii, Candytuft, Balsam, Morning Glory, Aster, are among the glories of the summer garden. Try whatever novelties you will—none can take the place of these.

PERSONAL ITEMS.

A. R. Corbin, who married Virginia, the sister of General Grant, died at Jersey City on Sunday last at the age of 71 years.

General W. S. Hancock owns a farm near Windsor, Henry County, Mo., and has ordered some extensive improvements to be made on it with the view of ultimately making it his home.

By the will of the late Dr. John M. Broadhead, ex-Comptroller of the United States Treasury, $3,000 are set aside for the use of his cousin Olive and niece Cornelia on the following conditions: They are each to set apart a garden 60 feet square, which they are to plant with currants, strawberries, thimbleberries, raspberries and other suitable fruits. A daughter of Olive "is to post herself on the planting of fruits" and to allow no weeds to grow up in this plantation, "thus correcting carelessness on the part of her father."

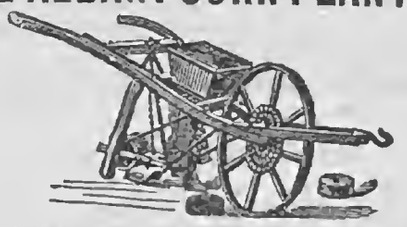
Charles C. Frost, a learned shoemaker, has just died at Brattleborough, Vt., at the age of 74 years. He began to take morning walks through the fields on account of ill health and so became interested in botany. He sent to London for a standard work on botany, and when he found that the work was in Latin he bought a Latin grammar and began the study of that ancient tongue. He mastered Latin, French and German and received the degree of A. M. from Dartmouth and Middlebury Colleges. In botany he was a leading authority.

Neuralgia—A Remarkable Cure.

The following extracts are from a letter received from S. A. Russell, Mescalero Agency, New Mexico, dated June 5th, 1879:—"I felt satisfied that if the remedy (Compound Oxygen) was really what you claimed it to be, it was just what I wanted for a daughter who had been a *sufferer with neuralgia for more than fifteen years.* I wrote you for a copy of your Treatise on Compound Oxygen. After reading this little work, and the certificates of such men as Judge Kelley, T. S. Arthur, and others, I felt that if these were genuine, there must be REAL MERIT in the remedy. * * * I then ordered the remedy sent to my daughter in Kansas. That was about one year ago, and since using the supply then ordered, *my daughter has not only not had neuralgia, but considers herself in perfect health.* * * * Regarding my daughter as having, through the blessing of God, been *permanently cured of as stubborn a case of neuralgia as it is possible for any person to be afflicted with and live, by the use of your Compound Oxygen,* I esteem it a PLEASURE and a DUTY to send you this statement." Our Treatise on Compound Oxygen, which contains a record of many remarkable cures, sent free. Address DRS. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.

Implements and Machinery.

THE ALBANY CORN PLANTER



PLANTS ALL KINDS OF SEEDS WITH PRECISION.

Awarded the Highest Medal at the Centennial, as being the best Planter.

SAVES ITS COST IN PLANTING FIFTEEN ACRES OF CORN. One man and a horse can plant from seven to ten acres of corn in one day, with the Planter, at a cost of from $3.50 to $4.

COST TO PLANT FIFTEEN ACRES BY HAND:

Marking, man and horse, 2 days, at $3	$ 6.00
Planting, twelve men, at $1	12.00
Board, ten men, two meals each, at 25c	5.00
Wasted, one bushel of corn	1.00
Total cost by hand	$24.00

Self-Operating SULKY RAKE.

IMPROVED LION,

Best Rake Made in the World.

Send for Circular, etc., to O. H. P. CORNELL, Proprietor Albany Agr'l Works, Albany, N. Y.

LA DOW'S JOINTED

Pulverizing and Smoothing HARROW.

Light, Simple, Cheap. Durable and Flexible

Being jointed in the center, is adapted to both smooth and uneven surfaces. Acknowledged the best of the kind, and will pulverize and cover seed better in one operation, than going over twice with others. Made with both Chilled Metal and Cast Steel Discs polished. Send for circular and price list. Manufactured by

WHEELER & MELICK CO.,

Albany, N. Y., for the United States.

By EVERETT & SMALL, Boston, Mass., for the N. E. States, and by BUDLONG & CO., Aurora, Ill., for Ill., Iowa, Wis., Minn., Neb., Kans. and Mo.

"Also, La Dow's Disc Corn Cultivator"

INVALID ROLLING CHAIR.

(RECLINING)

A Priceless boon to those who are unable to walk. Hon. A. H. Stephens, M. C., and hundreds of others use them. Send for Circular to

FOLDING CHAIR CO., New Haven, Conn.

Implements and Machinery.

INGALL'S PAT. LINK AND CHAIN

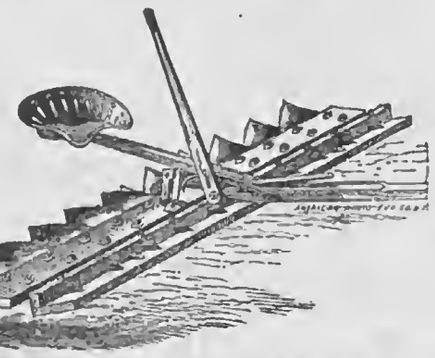
Will make or mend your chains, of all sizes, without tools. Inquire at your Hardware store or address

INGALL'S MFG. CO., Providence, R. I.

"ACME"

Pulverizing Harrow,

Clod Crusher and Leveler.



Has twelve steel coulter teeth and ten steel cutting spurs. Cuts over six feet wide, and two to four inches deep. The only implement combining Pulverizer Crusher and Leveler! performs all three operations at one time in the most perfect manner. Works perfectly on light soil, but is *especially adapted to sod and hard clay where other Harrows fail.* Agents wanted. Send for circular. NASH & BRO., Harrisburg, Penn., and 22 College Place, New York.

"Victor" one-horse Wheat Drills

(3 and 5 hoed,)

For Sowing Wheat, Rye, Barley, in fallow ground or in standing corn.

Force feed; simply constructed. The five hoed is adjustable for different widths, and is just what every small farmer ought to have, saving the price of a two horse Drill.

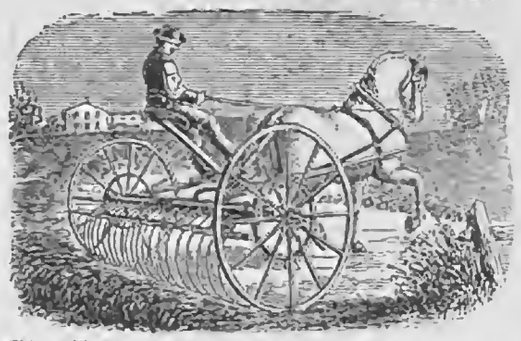
Manufactured only by EWALD OVER, [Send for circulars.] Indianapolis, Ind.

'THOMAS' PORTABLE ENGINE.

This is the lightest, most durable and economical Farm Engine made. It is from 1000 to 1500 lbs. lighter than other engines of the same power. It is warranted in every respect, and on account of improved method of utilizing steam is more economical in fuel and water. It is made especially to meet the wants long felt by Threshermen Farmers, &c., for an engine that would combine lightness with absolute strength and durability. Made in three sizes. Circulars giving full description sent on application to J. H. THOMAS & SONS, Manufacturers, Springfield, O.

Be sure and mention this paper.

THE GREGG



Self Dump Rake.

A boy or girl can operate it. This rake has been thoroughly tested, and is warranted to be first-class in every respect, made of the best material, and to do good work under all circumstances. Also, the

Meadow King Hand-Dump Rake.

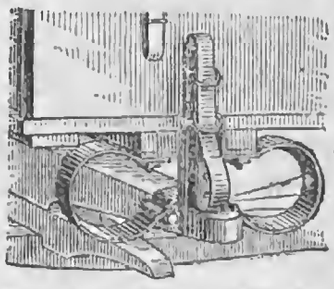
If there is no local agent in your vicinity, send for circulars giving full description, to

GREGG & CO., Trumansburg, N. Y.

SOMETHING NEW!

PULLIAM'S PATENT

BOLSTERS SPRINGS for FARM WAGONS.



This valuable device is suited to wagons of any size—made of the best steel and warranted—are attached by four bolts through the bed—can be put on by any person. They remain on the wagon for all uses and work equally well whether with empty or loaded wagon. There is no use for a spring seat—they make a comfortable spring wagon out of a farm wagon—and save largely in wear and tear. We want Agents everywhere. Send for description and prices, and mention this paper.

SEMPLE & BIRGE MFG. CO., St. Louis, Mo.

THE BELCHER & TAYLOR AG'L TOOL CO.

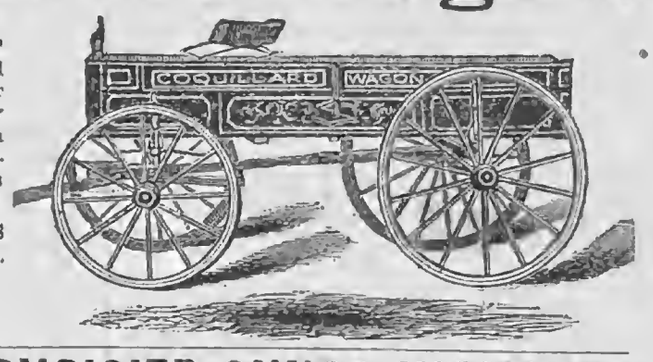
Manufacture this Plow of the *best Car Wheel Iron;* also of *Patent Hard Metal.* The handles vibrating from one side to the other as the plow is turned at the end of the furrow, enables the plowman to walk squarely behind the plow—a feature not possessed by any other Side-Hill Plow. It does as good work as any Land-Side Plow. For further particulars and prices send for our new *Illustrated Catalogue.* Address

GEO. S. TAYLOR, Agent, Chicopee Falls, Mass.

Implements and Machinery.

The Coquillard Wagon.

THE FARMER'S FAVORITE.



These wagons are made of the best Wood and Iron to be procured, and put together by the most experienced workmen. Every one warranted to give satisfaction, both in regard to quality of material and workmanship. They are also noted for their lightness of draft and ease of running.

Carriages, Buggies and Sleighs

Of superior workmanship always on hand. Send for Circulars and Price List.

Humorous.

"I'm a ruta-baga, and here's where I plant myself," said a tramp, as he entered a farm-house near Freeport, Ill., and seated himself at the table. "We allers bile ours," said the farmer's wife, and soused him with a dish-panful of boiling water.

A young lady just home from boarding-school, on being told by the servant that they had no gooseberries, exclaimed: "Why, what has happened to the goose?"

"Digby, will you take some of this butter?" "Thank you, ma'am, I belong to the temperance society—can't take anything strong," replied Digby.

Miasma Rendered Powerless.

The most certain way to render powerless the miasmatic vapors which produce chills and fever and other malarious disorders, is to fortify the system against them with that matchless preventive of periodic fevers, Hostetter's Stomach Bitters. The remedial operation of the Bitters is no less certain than their preventive effects, and they may be relied upon to overcome cases of fever and ague which resist quinine and the mineral remedies of the pharmacopœia. Dyspepsia, constipation, bilious complaints, rheumatic ailments, and general debility, likewise, rapidly yield to their regulative and tonic influence. They are an incalculable blessing to the weak and nervous of both sexes, an excellent family medicine, and the best safeguard which the traveler or emigrant can take to an unhealthy climate.

TREES

The largest and most Complete stock of Fruit and Ornamental Trees in the U. S. Priced Catalogues sent as follows:

THE FRENCH PARADISE APPLE AS A STOCK.

THE references which we have of late made to the French Paradise as a stock for dwarfing Apples, have brought us so many inquiries that we are assured the following remarks and correspondence, together with the accompanying illustrations, will prove of general interest. This stock is to the Apple nearly what the Quince stock is to the Pear, except that more varieties of Apples do well upon it than of Pears upon the Quince. The English Paradise, or Doucin, is used as a dwarfing stock; but the trees, while they grow larger, do not fruit as soon as those worked upon the French Paradise.

Professor Koch, of Berlin, has said respecting this tree that the name Malus paradisiaca appears to have been first used by Ruellius in the year 1537; that it is a native of south-eastern Russia, the Caucasus, Tartary and the Altai Mountains. He had often seen it in the Caucasus and near the Don and the Volga, where it forms bushes and dwarf trees, frequently accompanied with suckers. Mr. Robinson says that the Paradise stock has been known in France for between 200 and 300 years and that, when fairly tried, it proves to be of all stocks yet known the hardiest, most dwarfing and most powerful in inducing early fertility. This stock, he says, if planted in the coldest and wettest of soils, instead of sending long roots down into the sour, clayey earth, like the Crab and, in a lesser degree, the Doucin, keeps its wig-like mass of small roots near the surface, and, without root-pruning, will bear fruit long before the others. As to early bearing, we may say that of our five varieties on Paradise, all bore the second year and have borne every year since; but, except the Lady (Pomme d' Api), none has borne more than three or four apples. The Lady, not over four feet high, bore last year about a dozen.

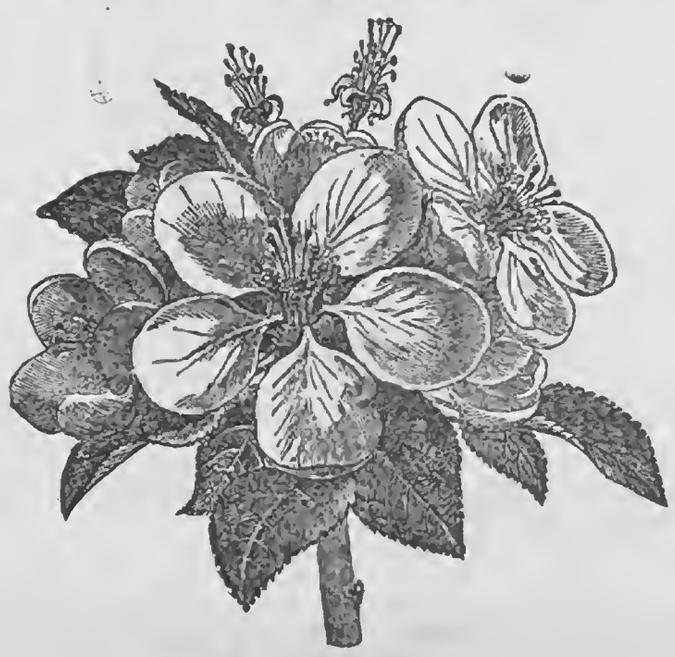
Mr. Robinson in his "Parks and Gardens of Paris," presents a letter from Mr. J. J. Thomas, to whom he wrote for information as to the value of Paradise stock in "the colder parts of North America." Mr. Thomas replies as follows: "The French Paradise stock grows well with us on strong soils, with suitable pruning and cultivation. Neglected and on light soils it frequently fails after a lapse of several years. The oldest trees with which I am acquainted in Western New York are on the grounds of Ellwanger & Barry. Trees which have been worked on it, thirty years old, still possess a fair degree of vigor, having stems six inches to eight inches in diameter, and the trees are about eight feet high, with about the same extent of branches. Twelve-year-old trees are five or six feet high and four or five inches in diameter."

Dwarf Apple Trees--French Paradise Stocks.

PRES. T. T. LYON.

THE problem, how to provide the possessors of limited grounds with an assortment of home-grown apples, adequate to their wants, and, at the same time, to avoid the necessity of introducing into such limited grounds trees whose natural growth will be sure soon to occasion a disproportion between them and the plat they occupy, as well as the desire of the nurseryman and pomologist to rapidly test the varieties with which they may have to do, and that without the necessity of devoting a large space to the purpose, have induced a resort, with the apple, to the process now so commonly applied to all our leading fruits—that of dwarfing, and at the same time hastening fructification by budding or grafting the varieties upon dissimilar stocks.

For the reason—as I imagine—that most buyers are in the habit of requiring large-sized trees, even when dwarfs are called for, it is the custom of nurserymen in general to use what is known as the Doucin stock, for dwarfing Apples, since the young trees so treated sooner reach the requisite size. On this stock, however, the vigor of the growth and the ultimate size of the tree are but slightly diminished; nor is the period of fructification very considerably hastened; while, as an inevitable consequence, the distance apart at which they should be planted, is only proportionately diminished.



FLOWER OF THE FRENCH PARADISE APPLE.—FIG. 111.

For the owners of village or city gardens, who of necessity can devote to fruit only a few rods of ground, in which a full-sized tree, or even an over-grown shrub, would appear out of keeping with the surroundings; and also for the trial grounds of the nurseryman and Pomologist, in which *quantity* of fruit is of less consequence than early fructification, and in which also close planting insures a considerable diminution of the expense of cultivation, a little thought or experience suffices to allay the anxiety for large trees.

FRUIT OF THE FRENCH PARADISE APPLE.—FIG. 112.

To supply the want of this large and increasing class of planters, resort is had to a yet more dwarfish variety of the Apple—the French Paradise Apple—which usually attains a size very little larger than that of a well-grown currant or gooseberry bush, and which, for that reason, may be planted from five to six feet apart each way, and yet leave sufficient space to accommodate the ultimate growth of the tree.

The French Paradise stock seems to be at home in almost any soil adapted to fruit growing; although, in light or poor soils, it will, doubtless, sooner and more constantly demand the employment of fertilizers. Like all dwarfs, its roots extend but a limited distance, and hence, in any soil, they will the sooner exhaust the fertility within their reach, for this reason requiring constant, careful and through cultivation.

Unlike the Pear dwarfed upon Quince stocks, all varieties of the Apple seem to be alike successful on the Paradise stock; the chief ground of preference being, that from natural habit of growth, some varieties are more easily kept in the desired form than others.

As a matter of convenience, Apples are generally worked upon this stock by budding during the growing season; although they may, when desirable, be grafted without difficulty. The buds are forced into growth the following spring by cutting back the stock to just above the insertion of the bud; and the shoots, after one year's growth, are, the following spring, again cut back to the proper hight for the commencement of the top, which should in no case exceed one or one and a half foot.

Dwarfs on Paradise stocks, when planted out, should always be set with the point of union at, or very slightly below the surface, for the reason that, if planted higher than this, they are less sure to hold their position firmly; while they are likely to show an unsightly enlargement at their point of union, with an increased tendency to sprout from the stock above the ground. On the other hand, if planted so low as ultimately to cause roots to push from above the bud, the influence of the dwarf stock is overcome, and the tree assumes the habit and vigor of a standard. A well managed dwarf apple tree on this stock, will generally show fruit the third year from the bud, and if well cared for at suitable times, may be kept in proper shape with very little, if any, use of the knife. Of course, to do this, reference must be had to the normal habit of the variety. When the trees are permitted to assume their natural form, without an attempt to put them into a "straitjacket" and mold them to a single model, the occasional lopping off or thinning out, of a superfluous shoot, and the "pinching in" of the excessively vigorous or misplaced ones, will in the main, suffice for this purpose, although, now and then, an open or straggling grower may require to have its shoots cut back in spring, to bring it into more compact condition; while the most upright or compact growers may need to be *spread*, either by thinning, or by staking and tying down the shoots, to open them sufficiently to the light.

It is believed that the dwarfing influence of this stock, while it diminishes the capacity of the tree for the production of fruit, tends rather to increase its size and brighten its color. How far this last may be true, I will not attempt to decide; but I feel quite safe in saying that, with the increased ability to produce the requisite variety of sorts upon a limited space, and within a comparatively short period, the use of the French Paradise stock offers to tradesmen, professional men, and city and village residents generally, the best possible means of securing an abundance, as well as a variety of fresh, seasonable fruit, such as no public market can be expected to supply.

South Haven, Mich.

A Note from Dr. John A. Warder.

MY personal experience with the French Paradise stock has not been nearly so extensive as my observations of its behavior in the grounds of others, both in this country and in Europe. Many years ago, when desirous of testing a great many varieties of Apples as quickly as possible, a large order for dwarfs was filled by one of the greatest nursery firms of our country. These were planted, and as the majority of the trees were worked on the Doucin stock, they grew famously in our strong soil, and were not fruited much, if any, sooner than if they had been on the common apple roots, and they made as large trees. Those worked on the true Paradise were dwarfed as desired, without any trouble of summer pinching, though that should always be practiced with espaliers, quenouilles, cordons or bushes in the perfect fruit garden or orchard-house.

Except for such refined gardening, or where the planter has a very limited space on which he wants to test a great many kinds, the Paradise is not a desirable stock, certainly not for general orchard planting. The Paradise tree or bush is too decidedly a dwarf, and is naturally lacking in the vigor and thriftiness which are sought for by the average American orchardist and fruit grower.

A Note From Ellwanger & Barry.

IN reply to your inquiries, we beg to say that the Apples on French Paradise stocks bear freely with us. They commence bearing at two to four years from bud, and bear every year, unless permitted to bear too much—which they are apt to do. We regard them as invaluable to nurserymen who desire to test varieties quickly; also to amateurs who desire a few choice Apples in their garden where standard trees cannot be grown; also to

persons taking up their residence in a new place where there is no fruit. A common error in the management of dwarf Apples is to let them root *above* the bud, or graft, when they will cease to bear freely, becoming, in fact, the same as standard trees. Another thing that may be said is that irresponsible parties sell and deliver trees as dwarf Apples which are not.

A Note From J. J. Thomas.

In reply to your note, I would say that my impression is not very favorable to Paradise stocks for *general* culture, and I would not recommend them widely—but they are interesting and convenient for amateurs who will prune and give them proper care.

PEARS.

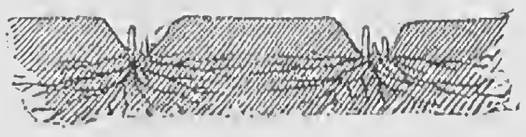
Ellwanger & Barry, of Rochester, N. Y., offer this season for the first time the Hoosic Pear, of which No. 3 in the accompanying sketches is a profile. It is a seedling of Bacon's Incomparable, and was raised by the Hon. A. Foote of Williamstown, Mass. Fruit large, obovate, having considerable exterior resemblance to Beurré Diel; stalk one and a quarter inch long, moderately stout and set obliquely in a slight depression. Calyx large, open, in a shallow depression. Skin greenish-yellow, dotted and marbled with russet. Flesh fine-grained, melting, juicy, with a rich almond flavor, like that of Edmunds, in quality ranking as best; tree an erect, *free* grower, very hardy, and remarkably prolific. Season October.

Messrs. E. & B. have fruited it for several years, and they think its many good qualities justify them in offering it to the public. The outline No. 1 is that of Pitmaston Duchesse. It resembles Duchesse d'Angouleme, which is said to be its parent, though of better quality; is a free, irregular grower, and, like its supposed parent, does admirably on Quince. It is ripe in early October. The outline No. 2 is that of Duhamel de Monceau. This is a French pear (Andre Leroy, '65)—large, long-pyriform; skin rather rough, nearly covered with brownish russet; flesh melting, juicy, with the flavor of Winter Nelis. The tree is a moderate grower. In use in November and December.

Horticultural.

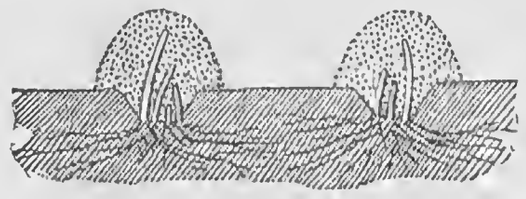
ASPARAGUS AND ITS CULTIVATION.

Were I to cultivate but one square rod of land and grow but one kind of vegetables, asparagus would be the one. In no other way could I get, from so small an area, such an abundance of green stuff, or such a variety of delicious dishes for my table, and all this with comparatively little labor.



ASPARAGUS PLANTS.—FIG. 113.

Many Americans set the plants not over three or four inches deep and break the young sprouts off close to the ground, when six or eight inches high, whilst gardeners in the Old World have the crowns of the plants about eight inches deep and cut the shoots when just appearing above ground. *De gustibus non est disputandum*, however,—there's no accounting for tastes. Whilst having a personal preference for the latter method, I am willing to admit that the lower part of the sprouts, when grown slowly and in unsuitable soil, is always stringy and unfit for food, yet I claim for the shoots, when grown quickly and without exposure to the light, a delicious tenderness and a flavor lacking in those broken off from above ground.



BLANCHING THE SHOOTS.—FIG. 114.

The essential conditions for success are warmth, abundance of stimulants and some materials eight or ten inches deep above the crowns, that will offer the least resistance to the growing sprouts, absorb much heat and keep out light.

Have plants in extremely rich, loose soil in rows 2½ feet or more apart, leaving the crowns free, or but slightly covered. See fig. For the material to blanch the shoots, I am inclined to the belief that dry forest leaves, packed quite loose, would be the best, provided they are kept from being scattered by the wind, either by the use of wires or some other device—boards will not answer.

Having last spring, a quantity of fine sawdust, which had been thrown in the track of the horse-power and mixed by the horse's hoofs largely and thoroughly with loam and horse-manure, I put this in ridges over the rows, as shown in fig. The material kept very light and loose all through the season, and the plants, stimulated by frequent applications of strong liquid manure between the ridges, pushed their shoots vigorously upwards. Many were cut measuring 18 inches in length and one inch in largest diameter, blanched to the tips and of a delicious tenderness and flavor. When a sprout breaks through the covering, the latter may be removed a little, thus laying one side of the sprout bare almost to the roots and affording a good opportunity for cutting it, the covering then is easily put back in it proper position.

It will be seen by fig. that the roots between the ridges, are but a few inches below the surface and therefore more exposed to the influence of the sun's rays than they would be with level cultivation. In the fall a heavy dressing of fine compost may be applied between the ridges and the bed leveled off. Whatever market gardeners may think of this treatment of asparagus, I at any rate am highly pleased with the results obtained.

Field Crops.

HOW AND WHEN TO SOW GRASS SEED.

H. L. WYSOR.

The following article is offered in the hope that some of its suggestions may prove of value even to those whose experience has been long and extended, while, it is hoped, it will enable the beginner to avoid the errors into which the writer himself fell.

It is the general practice of farmers here, and perhaps throughout the United States, to sow their clover and other grass seeds in the spring among the growing wheat, rye, or oats. Ten years or more ago, the sowing was done from the middle of February to the middle of March, when the frost had left the ground open in cracks and seams, into which the seed fell and took root. Now, however, a majority of farmers harrow their wheat, and the grass seed is sown before the harrow from the 1st to the middle of April in this latitude. In this way a catch of grass is nearly always obtained, though I have never observed that the wheat derived any benefit from the harrowing, as is frequently claimed. The common, straight-toothed harrow tears up much of the wheat, besides covering the remainder with earth, which seems for a while to retard its growth. The Thomas Smoothing Harrow is the best implement for this pupose; its teeth, inclining backwards at an angle of about 45 degrees, cover the seed lightly, but sufficiently, and do no injury whatever to the wheat, even if they do it no good. At any rate, our graziers would much prefer to lose the wheat crop than to lose a catch of grass, and therefore care very little about any injury that may be done the wheat in the process of harrowing.

It is not at all a difficult matter to obtain a good set of grass in stiff clay soils, and this, too, when the soil may be very thin. The grass rarely ever perishes, save in seasons of long-continued drought. But on sandy and gravelly soils, the case is quite different, and, with the ordinary methods employed in securing it, a good stand of grass is rather the exception than the rule. Such soils, from their thirsty nature and lose texture, do not compact around the small plants, but allow them to perish for want of moisture except in unusually wet seasons. In my earlier attempts at sowing grass, I threw away many bushels of clover seed before I found this out. On land of this description it is always best to harrow in the seed and follow with the roller. I have frequently noticed that where a road had been trampled through the field and the soil made close and firm, there was a good catch of clover, while on either side there was an entire failure.

One of my neighbors, instead of sowing his corn field in wheat in the fall, as is usually done, always sows it down in clover after the last working of the corn, and he seldom fails to secure a good stand. To follow this method, it is necessary to keep the corn perfectly clean and free of weeds, and to cultivate flat, so as to leave the surface smooth. The corn protects the grass from the heat, and at the same time does not crowd it, as is the case in fields of small grain. By fall the clover has complete possession of the ground, and does not have to struggle for a fitful existence with the rag-weeds, which spring up in vast numbers in the stubble fields. The farmer, however, loses his crop of wheat; it would be better therefore, if one wishes to sow grass seed in the corn, to reverse the old rotation, and instead of the order, corn, wheat, grass; put wheat, corn, grass. I presume that the uncertainty of being able to plow sod land in the summer season, has alone kept farmers from doing this.

It is not an uncommon thing for the summers to be so dry that even stubble fields are plowed with difficulty. But there are certainly obvious advantages in turning over the sod first for wheat. In the first place, the plowing being done in July and August, more weeds and other pests of the fields are destroyed, and they are turned under to rot and enrich the land. In fact, this is the only way in which the running brier, or dewberry vine, can be killed at all. Many fields all over the country are literally covered with these briers, to say nothing about the Blackberry. Now, turning these briers under in the spring is the best possible way of setting them out and cultivating them; for at every point they will send up a new sprout to be the nucleus of innumerable runners. If the plowing must be done in the spring, they should be cut off with the scythe before the ground is plowed. Two or three summer plowings will exterminate them on the worst-infested field. Then the corn, being always planted on a stubble, is never troubled with the wire and cut-worms, which always exist in sod land. The grass seed may be sown in the corn as above suggested, or the sowing may be deferred till the succeeding spring, when the corn stubble should be plowed and the grass sown by itself. Some men would prefer, in this case, to put the corn stubble in oats and sow the clover along with them; for my own part, I do not think the sowing of grass seed with oats advisable, although some good farmers advocate it, and secure good catches in that way. In case of drought, however, the oats, standing on the ground longer than wheat or rye, make heavier draughts on the soil, absorb all the moisture, and thus take away all nourishment from the grass, which is either entirely killed or loses its vigor for the remainder of the season.

A plan, followed by myself for several years past, has been to wait till after harvest before sowing my grass seed; then to break up my stubble either with the swing plow or with bull-tongues; harrow, and sow down with clover and orchard grass, or clover and Randall grass. If one can afford it, especially where his fields are thin, it is always best to sow grass seed alone. There are very few farmers who have failed to notice that in the spots in wheat fields, occupied at seeding time by corn shocks but left naked in the spring, the grass is higher and thriftier than elsewhere.

Timothy should always be sown in the fall, and may in this climate be sown with safety as late as the middle of October. It seldom does well when sown in the spring. All the other grasses must either be sown in the spring or not later in the fall than the last of August or the first of September.

The following quantities per acre are sown here: Clover and timothy (alone or together) one bushel to eight acres; clover and orchard grass (together) one bushel of the former and five bushels of the latter to ten acres; orchard grass alone, if the seed are perfectly clean, one bushel to the acre, otherwise two bushels to the acre. The same proportions are observed for Randall grass. Clover, one quart per acre; orchard, one peck per acre; Randall, one gallon; Red top, one gallon, per acre.

Pulaski Co., Va.

MAXIMUM YIELD OF WHEAT.

The question how large a crop of wheat can possibly be grown upon an acre, is so often asked that I have had the curiosity to compute the rate per acre of wheat harvested by the German chemist, Hellriegel, in his somewhat noted experiments (See Professor Johnson's "How Crops Feed"), made several years since with the view of growing a perfect grain crop; that is to say, the largest possible crop obtainable when the plants are provided with all the food and air and water they can make use of, as well as with plenty of light, heat, and standing-room in soil of the best quality. The experiments were, of course, made on a scale small enough to permit absolute control of all the conditions of fertility above enumerated, and that the plants might be completely protected from injury by frost, wind, rain or hail. They were carried to the utmost perfection with barley to which crop, indeed, most of them relate. Only comparatively few experiments were made with wheat, and in the very brief account of the trials, which is accessible to me, no mention is made as to which variety of wheat was grown. It is not even perfectly clear that a somewhat larger yield of wheat might not have been got in case the wheat experiments had been carried on further, with the same painstaking elaboration and repetition which were devoted to the barley trials. Nevertheless, it appears plainly enough that Hellriegel harvested wheat-grain at the rate of 125 bushels (of 60 pounds each) to the acre; and that he harvested barley at the rate of 195 bushels (of 48 bounds each) to the acre. One of his barley plants, apparently of exceptional merit, is described as having borne 636 grains.

Farm Topics.

WESTERN FARMING—IV.

W. I. CHAMBERLAIN.

Spring Work.

I should like to turn aside from the general purpose of these articles, viz: the comparison of modes and styles of farming, to give a few hints on spring work; and wish to make them general in character, like those on autumn work in these columns last fall.

A General Plan of Work

is most useful, and should, I think, be carefully prepared and *written down* in the farmer's dairy or elsewhere before the spring work begins to press. Then, as the weeks pass, it is well to check off the finished work and see how nearly we have come up to our ideal. A general estimate of expenses and earnings should be made, too, in advance. We should make up our minds what permanent improvements we ought to make and *pay for*, or what debt we can pay up, or what increase make in number and value of our live stock. Of course, accident, or sickness, or partial failure of some important crop, or death of a valuable animal, or like misfortune, may partly thwart our plans and make us fall short of our hopes. But we shall do far more if we have a plan,

and make an estimate, and try for a definite gain or improvement, than if we work at random.

We should be systematic and orderly. Spring work of some kinds must be done at just such a time. Other kinds can be done any time. The first kind should always, of course, take the precedence when its time comes. It is an excellent rule, too, to finish one job before another is begun. Change of weather or other sufficient cause may justify departure from the rule; and often several processes or crops must be watched and carried on together or alternately. But there are certain natural divisions of labor, and *unnecessary* change of work usually involves loss, and waste. For example, work in the sugar camp, if there is one, can usually be *finished* before regular spring farm work is begun. Dull days, when sap does not run, may be used in cutting and stowing the wood for next year's boiling. Prepared a full year beforehand, it is worth almost twice as much for blaze, and blaze is what we want. When the run is really over, the washing and stowing of buckets, utensils and implements should be prompt and thorough, and everything be put in perfect readiness for next year. Then, and not till then, are we ready to begin spring farm work in earnest.

The weather and the season's progress must, of course, decide the order of this. Grapevine pruning precedes even the sugar work. Spring wheat, oats and barley should be dropped in very early to secure the best crops. March or early April, is the time in latitude of 40 and 41 deg. at the West. Fruit trees should be pruned before the bark will peel. I am of those who believe in a light annual pruning rather than in a "big job" once in five or ten years. If trees are shaped and pruned aright when set, and the limb suckers kept down each year by thumb-pinching of buds in summer and the light use of the pruning shears in spring for shoots that have escaped the pinching, large limbs will seldom need to be removed with the saw.

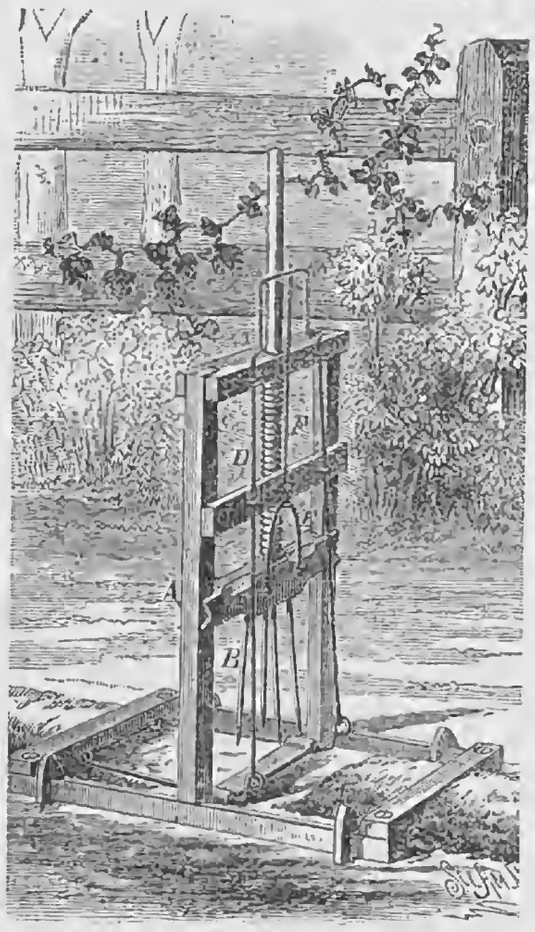
Post holes should be dug before the ground is dry and hard, and new fences built and old ones repaired in weather too dull and damp for tillage. The same conditions of weather and soil, too, favor tile drainage, if any of this work remains over from the fall and winter's "stint."

The Farmer's Garden

is usually, or at least often, "a by-word and a hissing." It *is* small business to potter by hand here when farm work is pressing and your team might plow two acres for corn or drill in ten acres of oats or barley, or plant twelve of corn with the patent two-horse "rower." But if the garden is *long and narrow*, and planted *in rows, not beds*, the plowing and harrowing and most of the marking and cultivation can be done with the team, and a very little time each week will give us the essentials. The perennial or permanent vegetables, like asparagus, rhubarb, etc, and all berry plants and bushes should be at one side or both *in rows* with spaces for horse cultivation, and the long rows of annuals down through the middle. A row each of beets, onions, Swedes, cellery, cabbages, cauliflowers, and salsify, and half a row each of cucumbers, squashes, melons, tomatoes, radishes and lettuce, will do nicely, and two rows each of peas (in succession), Lima beans, sweet corn and early potatoes will make out quite a respectable farmer's garden—all that most farmers can afford to plant and till. Then two or three hours each week with horse and man and cultivator and hoe, will make a far better garden really than as many days of a gardener with spade and hoe, working on patches and beds and alleys, laid out to please the eye. If you can afford the latter, all right. Most farmers cannot, and the row plan described is, I think, the only one likely to secure good kitchen-gardens on most farms. If the garden is unfenced except from the road, and these garden rows can be joined on to rows of corn or potatoes in an adjacent field, the garden is sure of tillage at least when the field gets it, and the extra labor is little felt. And it is easier to fence the *fowls* than the vegetables.

Field Cultivation of "Hoed Crops"

should be almost exclusively *without* the "hoe." In many parts of the West the large fields of corn, potatoes, broom corn, etc., never see a hoe at all. How the East may learn from the West! Corn is planted with a two-horse "rower" that plants 13 acres a day better than it can be done by hand. It puts the seed down two inches into damp soil, below the reach of the harrow teeth soon to follow and sure to uproot or displace ordinary surface-planted corn. Potatoes are covered with a horse. Both are harrowed thoroughly several times before and after coming up. The Thomas Smoothing Harrow is best for this. Indeed, it is the only implement I know that is a perfect success as a broadcast weeder and tiller of *growing crops*. It kills the young and tender weeds, if used every few days, and leaves unharmed and greatly benefited the firmer, deeper-planted corn, potatoes, oats, wheat, etc., and it mellows the soil *in the hill* as no hoeing can. Then (for corn, potatoes, etc.) the two-horse cultivator, with earth guards, throws the soil close up about the rows, but does not cover or break down the stalks, and gets over the ground twice as fast as the old one-horse cultivator. Finally, the shovel plow with adjustable wings, hills up the potatoes completely. And so our Western "hoed crops" are not hoed at all, and if properly tilled *from the first* with these implements, will not be weedy at all, and will be far better tilled than with the hoe. It is a good rule never to do by hand what a horse can do *cheaper*. Not laziness but true economy dictates this rule.



MOLE AND GOPHER TRAP.—FIG. 116.

Work for Rainy Weather.

I am not of those who think it hurts a farmer or his hired man, or men, to rest when it rains. When rain sets in in the afternoon, I believe it is often best to rest till night and give teams and men the time to do the same. But often there are whole days of rain, and for such times work should be planned. Cord wood in a good shed may be sawed and split into stove wood, or old rails into sugar wood. Seed potatoes may be cut, potatoes "sprouted" and hay, straw and stalks chaffed for cut-feed to last for some days or even weeks to come. Barns and cellars may be cleared out and put to rights and the latter whitewashed. Work harness may be washed and oiled, axes and other tools ground and put in order for use, and many jobs of tinkering be done in barn or shop, if only they are down in your memorandum or your mind, so that you will not have to stop and "think them up." Profitable work, too, must be planned for times when, though it does not actually rain, the soil is too wet for tillage. There must always be promptness and wisdom of decision on the part of the successful farmer. His men must never see him at his wits' end to plan work for them, or dallying in doubt. If he dallies here, they will dally at the work. Hired men work far better when they see that they accomplish something than when from the mismanagement of their employer, they cannot earn him their wages, even though they may not have to work so hard in the latter case. They prefer, too, to work for the farmer who works with them, or at least is with them most of the time, than for him who is off at town or elsewhere half of the time. And as for the farmer himself, the old "saw" is still true,

> "For he that by the plow would thrive,
> Himself must either hold or drive."

On large farms in England and elsewhere the superintendence of the work may be enough for the farmer, but on small American farms the farmer himself must usually be a worker. But he must be a thinker and a superintendent too, and at no time of the year is it more important for him to have clear and well-arranged plans and promptness and decision in their execution than now. For in the spring time the preparations are made and most of the crops put in whose growth and sale and use, must pay his hired help, support his family and lay by something for a "rainy day" or for old age.

Farm Economy.

FARMERS' EXPERIMENT PLOTS.

EVERY season for three years past the RURAL NEW-YORKER has suggested to its readers that they should experiment for themselves in order to ascertain what concentrated manure their soils stand most in need of. Some fields may most need potash; others phosphoric acid, etc. Some may need only one—some two—some all, or what has been termed a complete fertilizer. If by test it were found that a given field would produce as much corn by the addition of 250 pounds of bone flour as by the addition of a thousand pounds of a complete fertilizer, it is plain that the difference in cost could be saved for one year or for more, according as the supply of the other fertilizing ingredients was greater or less. The diagram will sufficiently show our readers the best method of conducting such experiments. Each parallelogram may represent 1-40, 1-10, 1-4 of an acre or an acre, if so much land could be spared to the experiment.

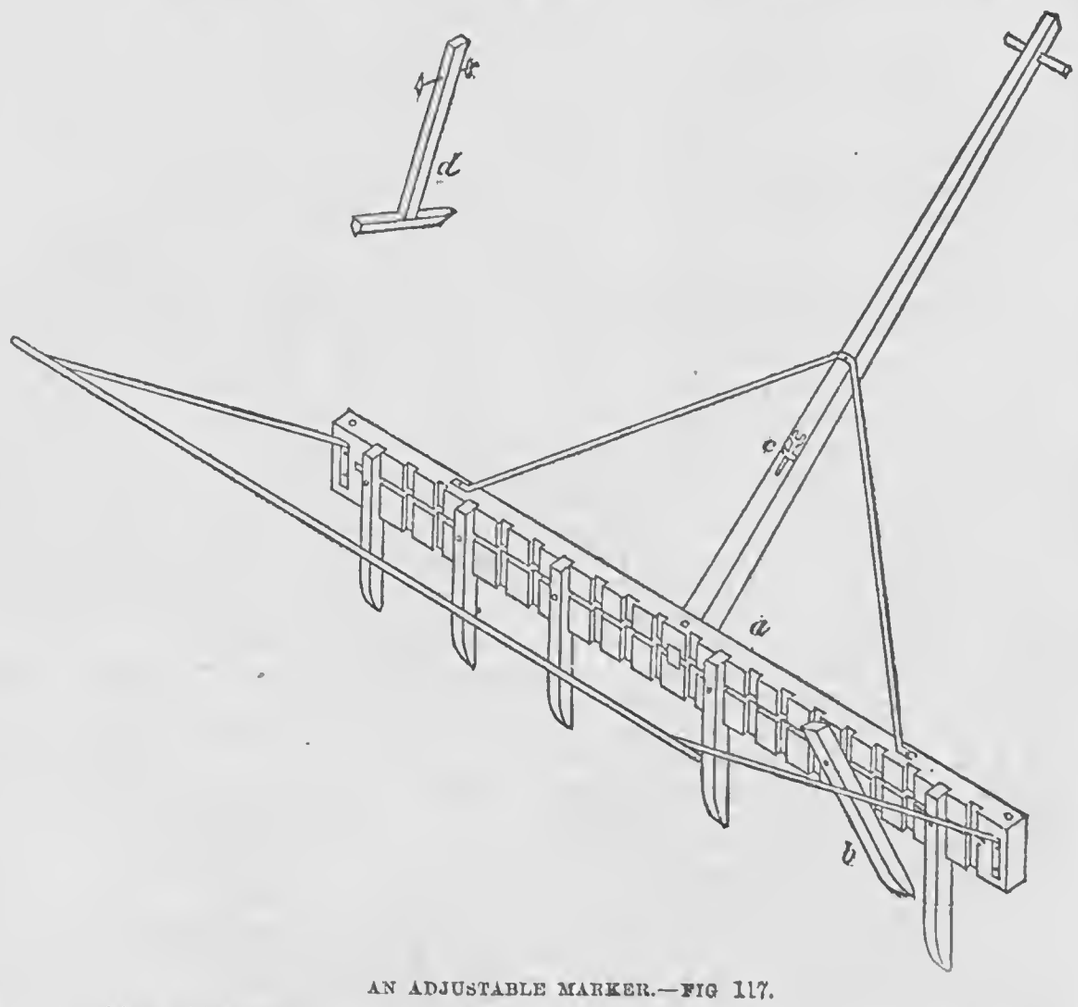
Any of the first-class fertilizer firms of the country will furnish the different ingredients as needed, since such firms are naturally desirous of familiarizing farmers with the use of their own goods For phosphoric acid, bone black is perhaps the best. For nitrogen, nitrate of soda. For potash, muriate of potash. The diagram will suggest combinations, and others still may occur to the experimenter.

EXPERIMENT PLOTS.

No manure.	Farm Manure.	Phosphoric Acid
Potash.	Nitrogen.	Nitrogen and Potash.
Nitrogen, Potash and Burnt Bone.	Bone Flour.	Leached Ashes.

NEW MOLE AND GOPHER TRAP.

IN the RURAL of March 20, we published illustrations of two very efficient mole traps, and we here present another devised for catching moles and gophers, the construction of which is plainly more complicated than that of either of the others, though, of course, the device may be equally serviceable.



AN ADJUSTABLE MARKER.—FIG 117.

The trap has a spring-acted follower guided by the vertical frame, A, and carrying four sharp tines or spikes, B. In the lower portion of the frame is pivoted a lever or trigger, C, which is jointed to the sliding wire frame, D. A bail, E, jointed to the follower is engaged by the catch, F, when the trap is set, and the long arm of the catch is retained by the upper part of the sliding frame, D.

A short section of the ridge of the mole track is pressed down by the foot and the trap is pinned down over the flattened place. When the mole returns it presses the lever, C, upward in the act of opening the path, thus releasing the catch, F, when the tines, B, spring downward and impale the animal. For the gopher the trap is fastened down over the mouth of the hole where it carries out earth. When it emerges with a load it presses up the trigger and springs the trap.

This useful invention was recently patented by Mr. Albert G. Rogers, of Lathrop, Mo.

AN ADJUSTABLE MARKER.

F. A. GULLY.

THE accompanying cut represents an adjustable hand marker, the teeth of which may be set at any distance apart, from nine inches, through all the multiples of three to 57 inches (the cut lacks one tooth), and they can be changed in a moment without taking out any bolts or removing the teeth from the marker, and they cannot be mislaid or lost.

The beam, *a*, is 1¼x5 inches, 63 inches long and made of pine or any strong, light wood. A slit, a half inch wide, is cut through its center except three inches at each end. The notches for the teeth to rest in are three inches apart from center to center, a quarter of an inch deep and an inch and a quarter wide. The teeth are 12 inches long, made of hard wood, each being fastened with one ⅜ inch bolt passing through the tooth and the slit in the beam, with a large washer and a nut on the front side of the latter. They are made to fit snug in the notches to prevent any side motion.

To change the teeth, the nuts are loosened—not taken off—when the teeth may be slipped along any desired distance; if but part of the teeth are needed the others may be tipped up sidewise, as shown at, *b*, and the nuts tightened to hold them in place.

Attached to the tongue, at *c*, is a leather loop to hold a small, flat wrench for changing the teeth. The tongue should be placed at such an angle with the beam that when the marker is being used, the teeth will slant back about 20 degrees from the vertical. This will give the marker a more steady motion than when the teeth are upright or point forward.

At *d*, is shown a tooth with a shoe or runner; the under side of the latter is beveled to an edge, and shows the exact center of the mark. When the seed is to be sowed with a drill, or by hand when the ground is dry, I prefer the teeth with shoes, as the marker can be drawn more easily as well as steadily, and more nearly in a straight line. The objection to using the shoe is that if the ground is at all moist, the bottom of the mark is packed too hard; if, however, a drill is used, the nose, or seed spout, will loosen up the soil when the seed is dropped.

Where much marking is done, it will pay to have a handle attached to the hand marker, as shown in the cut. Two men can then do the work faster enough to more than make up for the extra hand, and with much greater accuracy.

I have also used a one-horse marker made on the same plan. The handles of both are nearly as long as the beams, as shown in the engraving. In marking, after crossing the field or bed—following a stretched line the first time across—one tooth is drawn in the last mark made, for a guide; with the handle shown, the man who guides the marker takes hold of the end of the handle and walks behind the guiding tooth. By looking ahead he sees all the crooks in the mark previously made, and can vary the marker to make them straight. When the marker is turned to come back, he takes the other end of the handle, and so on. With this form of handle any careful man can make straight rows on even ground, while not one man in one hundred will do so with the ordinary marker with the handles at the center.

Lansing, Mich.

Spreading Manure.

I BEG leave to disagree with F. H. D. on spreading manure from a wagon. I think he is mistaken when he says it saves much time and is much easier. It is the custom of our largest and best farmers to unload their manure from the wagon in heaps, making from four to six piles to a load. A good man, with a manure or potato hook, can unload a large load in this way in five or ten minutes, and the spreading may be done at leisure, to fill in time. Most farmers keep hired help, and it is sometimes very convenient as well as profitable to have some light jobs in store to work at in odd spells to fill in time. When manure is spread from the wagon the team has to remain idle about half of the time, or while the driver is unloading; but when the manure is unloaded in heaps; which is done by removing one side board and hauling it off with a potato hook, the time required for unloading is so short that the team is kept busy most of the time.

G. A. G., JR.

The Swine-Herd.

PIG FEEDING.—No. II.

DR. J. B. LAWES, OF ROTHAMSTED, ENG.

In my last letter on the subject of pig feeding, I made some reference to the effect produced on the animal by the presence of more or less indigestible matter in the food supplied. I think it may be desirable to make some further allusion to his subject, as the question is one of considerable importance, and also because misconception, with regard to results which affect to bear upon the point, may easily lead any one to false conclusions.

I will give an instance:—Some time ago a friend, who took an interest in pig feeding, informed me that he was often in the habit of giving to his pigs a few pounds of coals, which had the effect of increasing their appetites.

I said to him, in answer, "I have no doubt that your pigs may consume more food, but you may be assured that the consumption of so indigestible a matter, will cause the food to pass through the system too quickly, the result of which will be that the animal will not receive benefit in proportion, and the food itself will be wasted."

Some years ago we tried at Rothamsted experiments with a celebrated condiment which was said to increase the digestion, improve the appetite, and enable the pigs to give a larger increase upon a given weight of food. The result of adding the condiment to the ordinary food, was to increase instead of to diminish the amount required to produce a given increase of the animal.

In the table which I gave in my last communication I showed that, for equal weights, a pig increased about six times as fast as an ox, and consumed twice as much food; but notwithstanding this fact the pig, further, left less excremental matter from the consumption of 27 pounds of dry food, than the ox from his food of less than half that weight.

Now, bearing in mind what I stated in my last letter as to the different character of the foods which the pig and the ox are adapted to digest, it is evident that when, what may be called the machinery of the animal, is employed in extracting nutriment from a large amount of comparatively indigestible matter, such as is found in the bulky diet of the ox, the rate of increase will by necessity be slow. A mill of a certain capacity cannot extract the same amount of gold from quartz rock, in a given time, where there are only five ounces of gold to the ton, as it could if there was double that quantity of ore. I think, therefore, it may be considered that in order to obtain the greatest increase in a given time, as well as the greatest increase upon a given amount of food consumed, such food must contain very little indigestible matter.

It is true that there are substances which might be used economically as food, both when a pig is growing and also when he is finally fattening; but many of these substances, in this country, we cannot use—at all events in the final stage—and for this reason, that the food consumed by the pig appears to have a more marked effect on the quality of the meat produced, than the food given to oxen and sheep, which, by comparison, affects but little the quality of the beef or mutton. Looking at the value of the manure obtained from beans and lentils, it would often pay the farmer better to use them as a fattening food than corn or barley used; but as consumers have found out that bean-fed pork is hard and unpalatable, butchers naturally object to purchase animals that have been fattened in this way.

The general result of our investigations at Rothamsted led us to the conclusion that, while the growing pig might be fed upon any or everything, the most appropriate food for fattening was corn or barley meal. I may further add that we obtained very good results when small quantities of bran were added to the corn-meal; but whether such addition was absolutely necessary to give the best results we are not prepared to say.

Veterinary.

ABORTION IN COWS.—II.

D. E. SALMON, D. V. M.

Having made a hasty review of our knowledge bearing on the causation of this great scourge, I must freely confess that this knowledge is exceedingly unsatisfactory; that there is no definite evidence on any point, that can serve to clear up the mystery surrounding the disorder, or that points to a practicable remedy. The discovery of bacteria is in itself without importance—these may exist in health as well as in disease, in common as well as in specific maladies; but if a particular kind of bacteria were discovered to be always present, if this were cultivated outside of the animal body for a number of generations and then, when inoculated, it produced the disorder, we would have a discovery of some importance. Again, smearing the generative passage with a decomposing, irritating discharge might cause abortion, irrespective of a specific contagious principle; and, even chlorate of potassa might act beneficially in other ways than as an antiseptic.

Now, I think I see a smile of derision on the faces of hundreds of dairymen as they read this confession of the ignorance and inability of the veterinary profession; I hear them ask, in my imagination—what I have often heard in reality—"Of what value is your profession to us, then, if you know neither the cause nor the remedy for a disease that results in losses amounting to $10,000,000 or $15,000,000 annually.

Allow me to say a few plain words to this class of men, for I know their number is legion. If the veterinary profession has no specific remedy for this contagious affection, it is not inferior in this respect to the medical profession which, so far, has failed to discover an agent that would control a single contagious disease, if we except the itch—isolation and quarantine are their only means of fighting these maladies, and to these the veterinarians can add slaughter, which makes their work far more effective.

But what has been done is no measure of what can be done—the different departments of science are daily throwing new light on the means of investigation, on the nature of contagious germs, and on the means by which these can be destroyed. The investigations that have been made with this, and most other diseases, are far behind the possibilities of the times. Why, then, does not the profession keep its knowledge up with the means of investigation? I will explain.

The investigation of this class of diseases requires special knowledge—it is the most delicate and difficult work yet undertaken by science—beside it, chemical analysis is an easy matter. It requires weeks, months, years even, of patient, unremitting application; long, weary hours at the microscope; the cultivation of the lowest forms of life in special apparatus, beyond the reach of the most minute germs floating in the air; determination of the conditions favorable and unfavorable to their existence; the testing of a large number of medicinal agents in solutions of various strengths; in short, a careful search for the vulnerable points of the organism. But time is money; apparatus and chemicals are money, and special skill may be classed in the same category.

Now, notwithstanding the great, direct and continuous losses sustained by the dairymen from this disease; notwithstanding the fact that they would be the chief gainers by any discoveries in regard to the nature or proper treatment, neither the veterinary profession, nor any member of it has ever been offered, to my knowledge, a single dollar to pay the expenses of the needed investigation! When an investigation of the diseases of animals is to be made, it is generally contended that a farmer, a physician and a *farrier* must be on the commission—the farrier being a cross between a farmer and a blacksmith. There is little appreciation of the proper qualifications of persons appointed to investigate such disease; as a result there are few specialists in the country to conduct them, and the money so seldom and sparingly appropriated does not produce practical results. In marked contrast to this policy, however, is Commissioner Le Due's appointment of veterinarians to conduct such work, for which he certainly deserves the thanks, not only of the profession, but of the country at large.

I have full faith in the ability of modern science to overcome these plagues, and I know that when there is any assurance of continuous and liberal support, the proper men can be found to take hold of these questions and persevere till success crowns their efforts. When the problem is to prevent an annual loss of $10,000,000, the yearly appropriation of $10,000 or even $20,000, for such investigations, sinks into insignificance, whether this appropriation is continued for two or twenty years.

It is a parsimonious, short-sighted policy in our different legislative bodies, that will see a thousand dollars destroyed and will not expend one dollar toward preventing such loss. But, primarily, the stock-owners themselves are the cause of this policy, for a united demand from them would secure any needed legislation; but neither Congress nor the State legislatures will appropriate money (except for political purposes) unless they know that they will be sustained by their constituents.

There are too many dairymen that have such unbounded confidence in themselves, as to believe that because they have been baffled by this disease, the veterinary profession will be equally unsuccessful; there are others who think that the individual members of the profession should make these investigations for the abstract love of science, which they are supposed to possess; still others hold the discovery should be made as inventions are, and the reward obtained by selling the knowledge to interested parties. But, it must be remembered that a professional man at once becomes a quack, when he sells either secret remedies or secret methods of preventing disease, and no man of honor would stoop to this; and, although he may have ever so much love of science, a professional man, like other mortals, must have a subsistence, and must see some return for time and expenses before he undertakes such investigations; finally, the extraordinary and unexpected success that has lately rewarded the studies of contagious diseases is sufficient to inspire the most inveterate doubter with confidence of the ultimate success of systematic, persistent and intelligent investigation, not only of bovine abortion, but of all other contagious diseases.

Treatment.

When a cow shows symptoms of aborting, remove her to a quiet place, at a distance from the other cows; give repeated doses of laudanum (two ounces, three times a day); give the other cows one half ounce of chlorate of potassa, daily, for a week, as a preventive. If the cow aborts, keep her at a distance from the others for, at least, a month; disinfect and bury deeply the fœtus and membranes, and keep the stable, in which she is, well disinfected with carbolic acid, chloride of lime, the fumes of burning sulphur or the three combined, and let her be cared for by a person who does not go near the other cows.

It is impossible to say what is the best disinfectant in a particular disease, except after careful investigation, which is yet wanting with this trouble; those agents which are very destructive to some germs are almost harmless to others. The ones recommended above, however, are most promising.

Injections of weak solution of carbolic acid, chlorate of potassa, or salicylic acid into the vagina after abortion, would lessen the discharge and possibly destroy its infectious properties, and might thus be of considerable advantage in preventing the extension of the trouble. At all events, if the affected animal was, at the time of the abortion or within a few days of this time, in a stable where other cows are kept, and if there is no reason to attribute the trouble to a blow, fall or similar cause, then, this stable should be thoroughly cleaned, scraped, the particular stall deluged with boiling water, and the whole stable whitewashed with the ordinary lime mixture, to which has been added one-half pound chloride of lime and four ounces crude carbolic acid to the gallon: the whole to be followed by closing the stable and thoroughly fumigating it several times with burning sulphur. When practicable, remove the healthy cows to another stable or lot where no diseased animal has been to infect it. When the trouble is once fairly under way, it is often the best plan to sell the whole stock, thoroughly disinfect as above, removing all manure first, and buy a new lot of animals.

These are the best directions that can be given at present; but, I repeat, there is reason to believe that a thorough investigation might improve on these in many respects; it might discover that, as with some other maladies, a certain agent has a peculiar activity in destroying the infectious principle of this disease; and, when found, such an agent might be successfully used as a preventive, and as a curative medicine after the symptons have appeared, and as a disinfectant.

If the most general form of abortion is really contagious, as seems to be the case, then it is caused by a living principle, which can only be produced by a pre-existing organism of the same kind; and this inspires the hope that, with increased knowledge, we may be able to destroy every one of such organisms, and thus rid the world of the greater part of the contagious diseases of men and animals. There have been many important discoveries in regard to the contagious maladies within the last few years, and nearly all strengthen this view. What we need is more earnest investigation; more faith in the resources of nature; a determination to exhaust every possibility before folding our hands in discouragement. One day the greater part of such diseases will probably be exterminated; and if we of the present generation hope to aid in this extermination, and to share the benefits of it, we have no time to lose.

Dairy Husbandry.

HOTEL BUTTER.

R. GOODMAN.

Stopping a day or two since at a new and somewhat pretentious hotel at Albany, N. Y., I was struck by the poor quality of the butter. That put on the table for the use of the guests was not better than very ordinary cooking butter, and both taste and smell united in pronouncing it unfit for the palates, if not for the stomachs, of the four-dollar-a-day patrons of the establishment. A gentleman at the table, hearing me ask the waiter if that was the best article of the kind in the house, thus having his attention called to it, remarked to his neighbor, that nothing gave a hotel such a "black eye" as poor butter. And yet how few public houses even in cities, give a good quality of table butter to their guests, and how rare to find it savory enough in country hotels and city or town restaurants to allow its spreading on the bread. I hear great complaints of the most prominent of the hotels in New York City on this score, and the clubs only avoid the disgrace of frequent animadversions by taking their supplies from private dairies, by which means they obtain an article of which the quality is not only good but equable. And this is found to be more economical than to furnish an irregular and common article of tub butter, and waste it, as is the ordinary custom. The waiters at hotels cut from the dish on the table about a quarter of a pound, "more or less," and "dab" it on the small butter plate of the guest, and the latter "musses" it over; and it is removed with the rest of the remains of the dinner, and ought to go into the "slush; but whether it does or whether it turns up again in the "cooked dishes," "no feller can find out." On the other hand, when nice butter from private dairies is served in little "pats," they are daintily picked out and those not used are untouched and can be served again as fresh and clean as if just taken from the package.

There can be no question that the hotel or club which provides itself with the best butter and has it come in rolls from which nice slices can be cut, or in pats of an eighth of a pound, will find that its butter bill at the end of the year is less than when an inferior article is purchased and wasted according to the usual custom, unless it is made to do double duty, like the proverbial "bread wastes" of boarding-houses, which are said to form the next day's pudding. Our hotels, restaurants and clubs are compelled by the force of public opinion to provide themselves with the best of bread, and they would be relieved of many guests if they furnished only the old square loaf bakers' bread and did not set before them French and Vienna rolls, Boston brown bread and other popular varieties. But as yet the "*gout*" of those who congregate at those caravanseries has not been educated up to the high-water mark, and it is a sad truth that Americans eat more bad butter than any other civilized people.

We are striving through the public press, which enters heartily into the matter, and by means of lectures, dairy meetings, and the like, to make the farmers ashamed of their slovenly habits of butter-making, and the business is becoming a specialty, and soon those who do not preserve cleanliness in their stables and in the processes through which butter is made, will fall back into poverty and shiftlessness generally, whilst those whose practice is the reverse will succeed. But, like all other reforms, even that of the Civil Service, the improvement should begin and be carried out at both ends, and whilst it is useless to enact reforming rules for tide-waiters and custom-house officers and let their superiors do as they please, it is equally useless to carry out these new measures of dairying, unless those for whose eventual benefit they are intended appreciate their value and assist their progress. If the guests of these expensive hotels, where four and five dollars a day should be an equivalent for the best of everything included in "bed and board," and if those of expensive restaurants would insist upon having the best butter as well as the best bread, the proprietors would soon come to terms. A guest at any of these places immediately turns up his nose at a too flavory chop or steak and sends it back, and would growl fearfully if a "wet" instead of a "dry" wine were put before him when ordering the latter; but his education is so incomplete in the matter of butter, and his natural taste so defiled by the quality he has been in the habit of eating, that he is not apt to detect the poor quality of that put on the table, nor of the much worse with which his delicate viands are drenched and injured. We mean to keep stirring up the farmers to compel them to furnish better butter than formerly, but their efforts must be appreciated, and the public everywhere demand that only good, sweet butter shall be put on the table at all times and in all places.

Lenox, Mass.

Petitioning Against Oleomargarine.—The following petition is being circulated for signature among dairymen, farmers, and butter dealers throughout the country:

To the Honorable the Senate and House of Representatives of the United States:

Your petitioners, dairymen, farmers, manufacturers of and dealers in butter and cheese in the United States, respectfully represent that serious injury is being inflicted upon the dairy industry of this country, and that gross imposition is being perpetrated upon consumers in America and Europe by the manufacture and sale of a compound known as oleomargarine—a mixture of fat with butter or milk—and generally sold under the name of butter, and urge the passage of a law

Prohibiting the admixture of fats with butter, milk or cream.

Prohibiting the use of all coloring matter in the fat of animals designed for food purposes.

Prohibiting the sale of oleomargarine as butter, and the use of the word butter in marking, branding or selling any other article than natural butter.

Prohibiting the exportation of oleomargarine, whether invoiced as oleomargarine butter, butterine, oleomargarine oil, or under any other name.

Prohibiting the use of ingredients other than the caul fat of healthy beef cattle in the manufacture of any article of human food.

Placing the manufacture and sale of oleomargarine, and other admixture of fat or grease offered for sale for food under the supervision of the National Board of Health, to prevent the use of refuse or diseased fats in their manufacture, and such other enactments as are necessary in the premises for the full protection of all producers and consumers.

The above petition, we are assured, was sent out by the National Dairy Fair Association. In it there are several objectionable features. Some of the prohibitions prayed for would, if enacted, injure rather than benefit the dairy interests of the country while others could receive no consideration from shrewd business-men of any class. Doubtless, however, it is merely designed as a basis for future legislation, as showing, in a broad way, the views of the dairymen of the country with regard to the manufacture of oleomargarine, and to express in an emphatic manner their sense of the tricky and fraudulent means by which the compound is being foisted on the public much to the loss of those engaged in the production of genuine butter. It is to be hoped, however, that the bill relating to this subject, which will probably be drawn up for Congressional action, will be free from the unwise provisions that mar this petition.

The Poultry Yard.

POULTRY ON THE FARM.

To keep poultry on a farm is economical. When a farmer keeps a herd of cows, a flock of sheep together with horses and hogs, there is always room on the farm for a good stock of poultry. Even when all the cows, sheep and hogs are kept that there is room for, there is still room for poultry. It is almost a necessity for every family to keep a pig in order that the refuse and house slops may be utilized; it is in the same sense that poultry are valuable—they are the scavengers of the farm. There is no class of fowls that require very much room on the farm. Still they do require room and attendance, and they may be kept in such a shiftless manner that they will be found unprofitable. All kinds of poultry may be kept provided they may have the run of the barn-yard; but they must be kept in such a manner as to prevent their ravages in garden and grain-fields. Turkeys, ducks, geese and hens may be kept all summer without using one square yard of room available for any other purpose. Care should be observed in providing for ducks and geese that they may not have the privilege—for such they will deem it—of fouling the water required for the stock, or making themselves a nuisance in any other manner.

Young chickens and turkeys will require some care for the first few weeks of their existence; after that, they may be trusted to care for themselves to a great extent. Poultry may be raised and a flock of hens kept producing eggs all summer without the outlay of one dollar for grain. Sour milk from the dairy is very good for young poultry, and there are many other articles of refuse on the farm that can be profitably used in the maintenance of fowls. Now, why is it that farmers do not indulge in the luxuries of fresh eggs daily during summer and also of fresh poultry more than they do? I know that it is too often the case that all the eggs produced on the farm are sold for groceries and other small items of household expenses. I know that too often all the poultry are sold to the butcher, and that sometimes the farmer does not taste a fresh egg or a chicken during the entire year. This is unwise. With a little care sufficient eggs can be produced only to make a profitable item in the farmer's income; but also to enable him to gratify his taste for fresh eggs as well. Poultry may be produced as cheaply as any other class of meat.

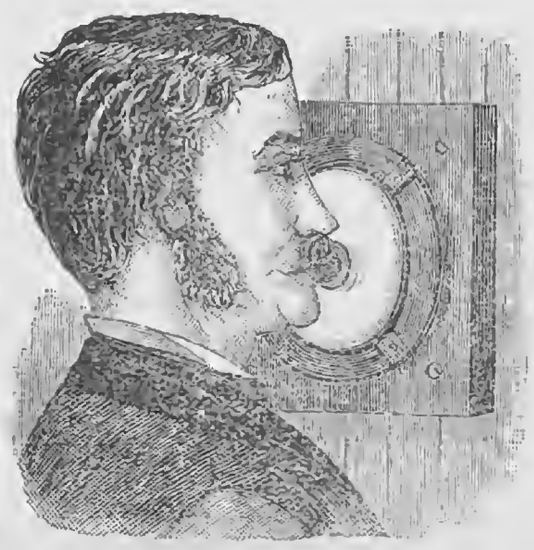
St. Lawrence Co. N. Y. F. K. MORELAND.

SOFT FOOD FOR POULTRY.—A writer in a contemporary says this gives diarrhea, and is the cause of much sickness and death among all domestic poultry, whether land or water fowls. I have fed for years past scarcely anything else than soft food, winter and summer, to my hens, and do not recollect a single case of disease or death from it. Occasionally there has been a slight softening of the feces when two much sulphur had been added to the pudding, but this ceased in a day or so after stopping the admixture of sulphur. My feed has been wheat bran and Indian meal, half and half, in cold weather and two-thirds to three-fourths of the former, with one-third to one-fourth of the latter in hot weather, mixed up with skim-milk when I had it to spare; if not, with water, hot in winter, but cold in summer. To every gallon of this I added four tablespoonsful of brine, and a spoonful of sulphur occasionally, as a guard against lice. Towards night they were fed at the rate of four quarts of oats to 50 fowls scattered on the ground for them to scratch and pick up. They had a high-roofed, well ventilated house to roost and lay in; a large, dry, sunny yard, and a grass plot to run on. Cabbage leaves for green food in winter. This is all. I kept three distinct breeds of fowls, Light Brahmas, White Leghorns and White Hamburgs. A. B. A.

Industrial Implements.

PROF. BROOK'S LOUD-SPEAKING TELEPHONE.

THE accompanying cut represents Prof. William R. Brook's loud-speaking, acoustic telephone—a reliable, durable and excellent instrument for conveying the direct human voice over lines of 50 to 5,000 feet in length. It is the direct sound wave, dispensing entirely with costly batteries and all magnetic appliances. Neither are the latter required for the



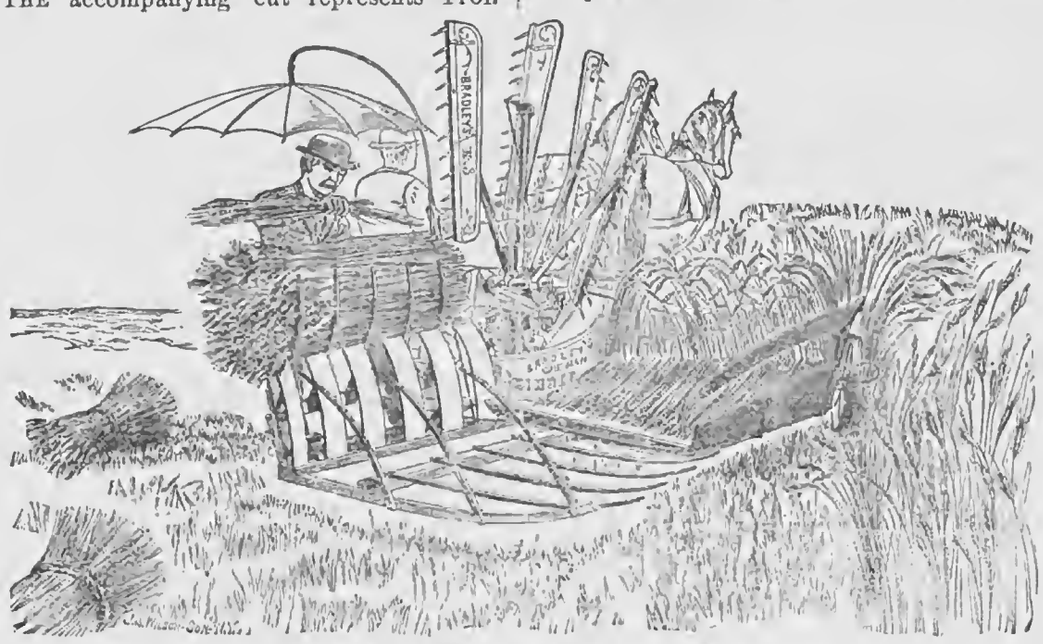
PROF. BROOK'S LOUD-SPEAKING TELEPHONE.

"signal" or "call"; but all is contained within the instrument. Not only is the voice transmitted with great volume and power, but it retains all its individuality so that the person speaking can be recognized. Singing and music are transmitted with wonderful effect. The wire used for the line is No. 20 copper wire, and may be obtained through any hardware store, or it will be furnished by the manufacturer. Large numbers of them are now in use and giving the highest sasisfaction. Any person can put up the line and telephone by the aid of the clear and simple directions sent with each pair of telephones. The low price at which they are offered brings them within the reach of all. For connecting offices, shops, factories and residences, for holding communication with your distant neighbor or friend in the next street, or the adjoining farm, they are very valuable. They are large and powerful instruments and made for practical business or social use. Good agents are wanted in every county, to whom liberal inducements are offered. The price is $5 a pair, and they will be sent to any address, by express on receipt of price. Can be sent by mail for 40 cents extra. For further information, circulars and testimonials of their efficiency, address, with stamp, Prof. William R. Brooks, Phelps, N. Y.

BRADLEY'S AMERICAN HARVESTER, NO. 3

With One-Man, Straw-Band Binder Attachment.

THE stress of keen competition between the various manufacturers of reapers and mowers gives these enterprising, wide-awake gentlemen no rest on the march of improvement in their several machines. Each is always on the outlook for some betterment which will render his own particular implement of greater value to the public than those of his rivals, and, therefore, secure for him a larger share of patronage. In the front rank of manufacturers of this sort of machinery Bradley & Company, of Syracuse, N. Y., have always held a prominent place, but they now expect to reach a still more conspicuous position by putting on the market, the coming season, an entirely new machine—a sweep rake reaper, to which can be attached a device by which one man can bind the grain as fast as cut, using a band of straw.



BRADLEY'S AMERICAN HARVESTER, NO. 3.

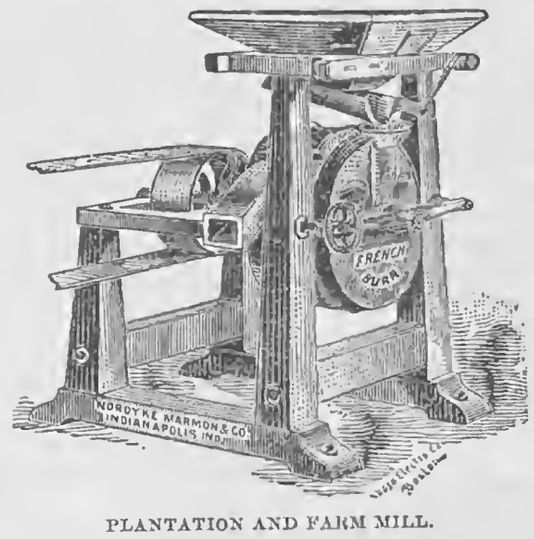
This machine will be known by the name at the head of this notice, and its appearance is shown by the accompanying illustration. The binder being seated at the rear of the machine, the gavel is swept from the platform on to the forks at the rear of the latter. While the grain is lying on the forks, the binder takes his band from it; the set of forks farthest from him then tip up, throwing the gavel upon the other set of forks which raise it on to his lap. The first set of forks then fall back into their place, while the other set are held in position for an instant, compressing the grain, and giving the binder an opportunity for putting the band around. These forks then fall back into their place, and it is the work of an instant to tie the band and let the bundle drop preparatory to a repetition of the operation. When it is desirable not to bind the grain as fast as cut, the binding arrangement is easily and expeditiously detached, whereupon the machine at once becomes a perfect sweep rake reaper. Its construction is simple, its weight, with the binder attachment, is not more than that of an ordinary reaper, and in view of its many merits we predict a wide popularity for it, and invite our friends to obtain fuller information about it by dropping a postal card to the manufacturers.

The Oneonta Clipper Plow.

Among the plows we strongly recommend to the favorable notice of our readers is the Oneonta Clipper, a reversible swivel plow, made by the old and well known Belcher & Taylor Agricultural Tool Co., of Chicopee Falls, Mass. The action of the shifting handles, vibrating from the center of the beam, bringing the coulter into position at each turn of the mold-board, enables the plowman to walk comfortably behind the plow, with both feet in the furrow. The hook and latch being worked by the foot, the plow is turned ready for use without taking the hands from the handles. This plow is easy to handle, light to draw, firm, strong and durable, made of the best charcoal iron, with the wearing parts chilled. Send for descriptive circulars and price list to the above address.

THE NORDYKE AND MARMON CO.'S MILLS.

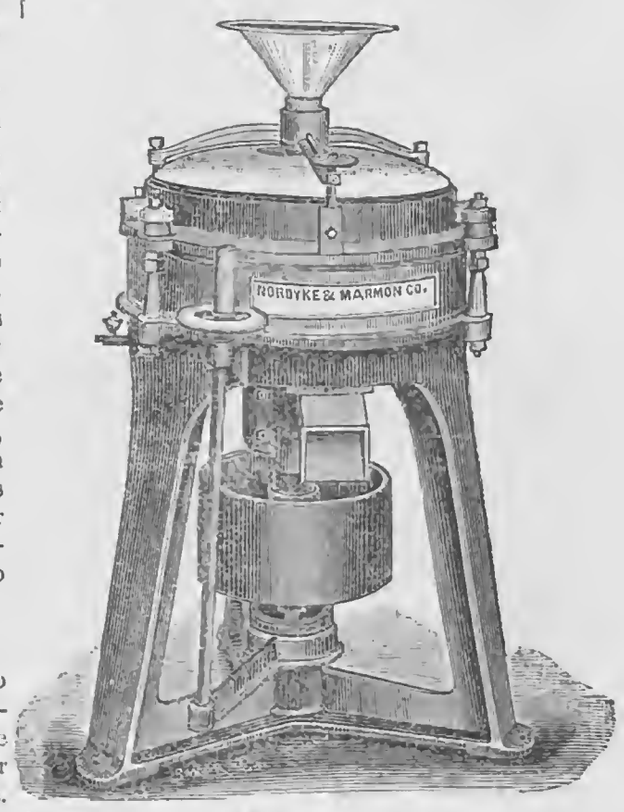
ONE of the best services an agricultural paper can do for its patrons is to call their attention from time to time to the best specimens of the tools, machines and other appliances connected with their business. In no case do we commend an article until one of our own staff has carefully examined it and reported upon its merits. As the opinions we offer on all industrial implements are quite reliable, so far as our investigations have extended, it would certainly be wise in our readers to send for circulars which are always furnishsd gratis and give far fuller particulars than the space at our command here will allow us to give of each article. Of the many advantages of portable grinding mills we have spoken so often, that it would be superfluous to repeat them in recommending to the favorable notice of our readers the widely known Nordyke mills, manufactured by the well known makers of mill stones and mill machinery, the



PLANTATION AND FARM MILL.

Nordyke and Marmon Co., Indianapolis, Ind. As there are upwards of 2,000 of these mills now in use, the intending purchaser can rest assured that in buying one he is making no experiment, but that he will get an article which has always given satisfaction. The grinding surfaces are the best, close, sharp French buhr stones, and capable of being run by any suitable power, and a boy can grind with them and keep them in order.

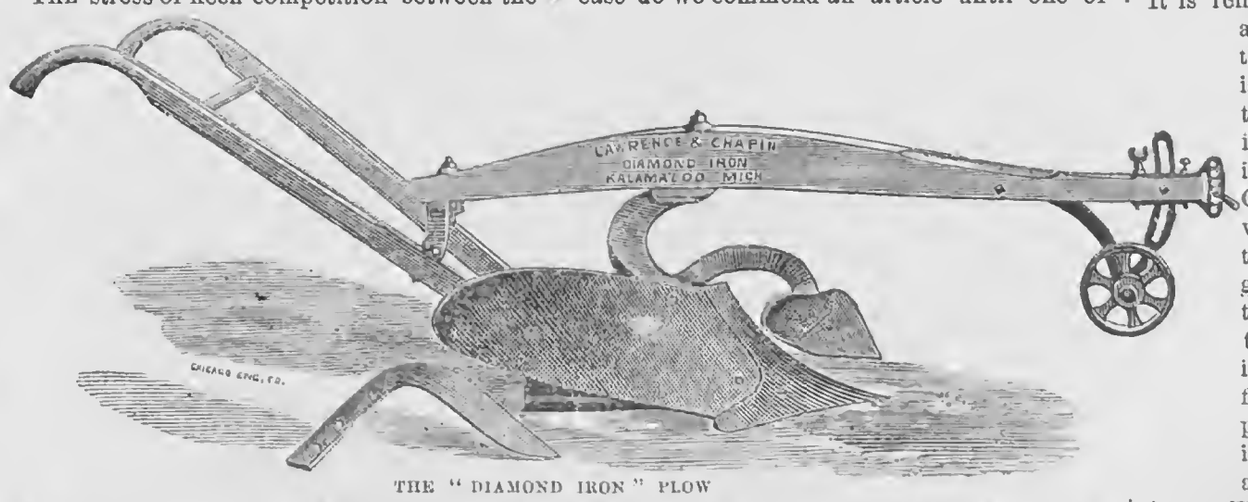
Of the mills made by the company we illustrate two here—the 20-inch New Era Mill for wheat, middlings and corn, and the Plantation and Farm Mill. Both mills are strictly first-class specimens of their kinds in material, workmanship, finish and efficiency, and we advise all who may be in need of so desirable a possession to send for full information about them, which will be promptly furnished gratis, on application.



NEW ERA MILL.

LAWRENCE & CHAPIN'S "DIAMOND IRON" PLOW.

IT is rather doubtful whether there is any agricultural implement on the perfecting of which more thought and ingenuity have been bestowed than on that of the plow. Among the numerous excellent sorts made by various firms the "Diamond Iron" manufactured by Lawrence & Chapin, Kalamazoo, Michigan, has by its intrinsic merits won a high reputation. The "diamond iron" is made of steel, wrought iron and cast iron, so cast, under a patent process, that homogeneity is insured. It is remarkable for its fine grain, hardness and strength, its breaking strength being three thousand pounds. So hard is it, it is claimed that it will make good tools without tempering and annealing, while the edge of a knife made of it will cut wood without crumbling. Of this excellent material all the wearing parts of the plow, including the share, are made, thus insuring great durability. Its weight is less than that of any "chilled" plow of the same size, while the perfection of its form makes it run steadily and do first-class work with a minimum expenditure of power. It scours well in any soil. The coulter is solid steel and the jointer arms steel or wrought iron. We have heard so many laudatory reports of the durability and efficiency of this plow that we strongly urge our readers to send for circulars giving a full description of it, to the manufacturers at the above address.



THE "DIAMOND IRON" PLOW

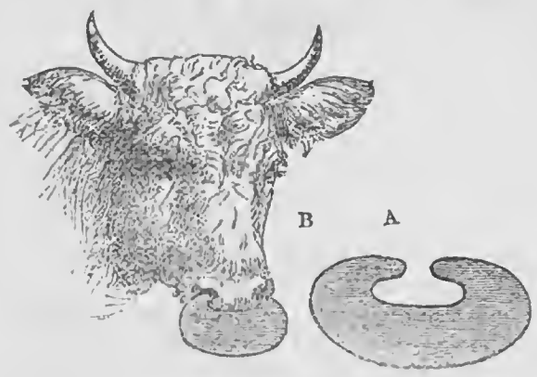
The Querist.

ANSWERS TO CORRESPONDENTS.

How to Prevent a Cow from Sucking Herself.

G. H. W., Salem, Ill, asks how to prevent a cow from sucking herself.

ANS.—Two excellent devices for this purpose were described and illustrated in the RURAL last year—one in the issue of July 26 and other in that of Dec. 6. In the first a stout stick of tough wood is suspended between the fore legs, one end being attached to a surcingle buckled about the animal's body, and the other fastened to a strap which is buckled to the halter. The strap uniting the stick to the halter should be at least 12 inches long to allow the necessary movement of the head to graze freely, while preventing the cow from bringing the head to the udder. For the benefit of our many new friends, we re-introduce the cut of the other device, redrawn from Prof.



ANTI-SUCKING DEVICE.—FIG. 118.

J. P. Sheldon's Dairy Farming, because a cut describes it better than words could, and because it is vouched for as thoroughly effectual. This device is made out of a piece of oak board, eight inches long five wide and a quarter of an inch thick, shaped as in A. The cow's nostrils should be sprung or bent until the piece is fitted as at B. Care should be taken not to make the two points too far asunder, as it would then easily slip off the nose. The points should be about half an inch apart, and nicely smoothed and rounded off, so as not to hurt the cow.

The Wager Peach.

E. H. C, Shepherdtown, Pa., wants some information about the Wager Peach. He expresses his doubt as to its ability to reproduce itself true from seed.

ANS.—Having referred this question to Mr. Downing, he writes us as follows: "I have not eaten or seen the Wager peach, and have only heard of it within the past few seasons, but from the notices given of it I would think it one of those hardy varieties that reproduce themselves from seed, like the Columbia, or Indian Peach of the South, and also like the Hill's Chili and others of the North. The Hill's Chili is said to be about eighty years old, and has reproduced itself from seed, or nearly so, since it was first introduced, and the Wager may be a seedling of it, as the descriptions are very similar." Mr. William C. Barry, of Rochester, N. Y., in a brief essay on new fruits, states that the "Wager Peach was originated by Mr. Wager, of Miller's Corners, Ontario Co., N. Y. It is a bright yellow peach, shaded with red on the sunny side; flesh, juicy and sprightly, and of fair quality; free, very hardy and productive; ripens about the same time as the Crawford."

Selecting Seed Corn.

W. S. M., Dutchess Co., N. Y., referring to Prof. Blount's remark in the RURAL of March 6, with regard to his White Prolific Corn:—"The top ear only of those stalks that ripen first and are most uniform, should be used for seed," asks what kind of ears are best to select for seed from the corn grown by him, the ears of which vary from eight to twelve rows each, the eight-rowed having a small cob and plump, solid and flinty grain; while the ten and twelve rowed have cobs from medium to large with long, dented grains.

ANS.—This corn has not yet established itself as a permanent variety, but it may probably be made to do so by continued selection. The more rows that can be grown, the greater is the product, and it would occur to most people to select seed from those ears having the most rows. A twelve-rowed ear has 50 per cent. more corn than an eight-rowed one, and if this excess could be added to the crop, 60 bushels would be increased to 90. This consideration might be worth study in selecting seed. The top ear is selected by Professor Blount probably on account of its greater vigor and earliness.

Apple Trees Dropping Fruit.

M. B. J., Vineland, N. J., asks how to treat an apple tree to make the fruit fair and prevent it from falling off before it is ripe.

ANS.—Some varieties of Apple have the constitutional fault of dropping a considerable part of their crop before ripening. The Tetofsky will usually drop three fourths of its fruit in this way, though they usually hold on until large enough for pie fruit. When this defect is characteristic we know of no remedy, though we believe that picking off about half the apples when one-quarter grown will secure the ripening of the other half. In trees where the defect is not inherent liberal fertilization and cultivation will usually cure it. Even the Tetofsky does not drop quite so badly in the garden as in the orchard. As to making apples fair, all is done that can be done when good culture is given and the depredations of insects prevented.

Remedy for the Apple and Peach Tree Borer.

J. E. Du Bois, Waverly, N. J., asks how to keep the borer from working in apple and peach trees.

ANS.—We use a wash of lime, sulphur, soap and carbolic acid, colored with lamp-black and red mineral paint. The first wash is applied in May and the trees are afterwards washed as they seem to need it. Placing tarred, oiled or painted paper or paste-board about the stem, and other remedies are advocated by many, but they are of doubtful value, all things considered. The peach grub works in the inner bark mostly, just at or a little above or below the surface of the ground. Its presence is indicated by gummy exudations and it may easily be traced and killed with the point of a knife. An orchard examined in this way in the spring and summer will not suffer seriously from this cause.

Weak-legged Turkeys.

W. C. M, Wallsville, Pa., has a flock of turkeys that were hatched quite late last season, and some time ago he noticed that they did not eat well and were poor and lean. Some, of them walked on the ends of their toes and on looking for the cause he found an unnatural white excrescence resembling "scaly legs" in hens; he applied sulphur, spirits of turpentine and grease without any good effect, and he asks what treatment would be likely to benefit them.

ANS.—Late-hatched turkeys often become weak for the want of proper natural heat while growing; their legs from that cause become weak and swelled. Give them warm, nourishing food with chopped onions; rub their legs with crude petroleum.

Miscellaneous.

J. H. S. Glenville—one of eight in the Union—asks 1, will it pay to sow plaster on meadow—both on new and old—also on oats—the first year; 2, how to make vinegar from a barrel of cider that lay out-of-doors last year from June till frost; 3, another barrel of the same age is quite sour, but tastes bad; it has plenty of "mother" in it, but the latter is of a black color, and he asks can it be cleansed.

ANS.—1. No one can say positively if it will pay to use plaster on any particular soil or crop. The probability is it would pay to use 100 to 150 pounds per acre on either grass, clover, or oats, as these crops are specially benefited by plaster. As the cost is very small, it would be desirable to try the plaster and note the result for future guidance. 2. If the cider was put into a clean barrel and is not moldy, it can be made into vinegar by keeping it in a warm place, and putting a piece of brown paper spread with yeast into it to start fermentation. The bung hole should be covered with gauze to admit air, while keeping out flies and dust. 3. Draw off the vinegar into a clean, sweet barrel, leaving the "mother" in the old barrel. What you think to be mother is probably a mass of fine apple pulp which was not strained out of the juice and has decomposed and become rotten. It may be necessary to filter the vinegar through pounded charcoal to free it from the bad flavor.

W. W. E., Pamprapo, N. J., says he is not a farmer, but he is anxious to buy a farm on which to make a comfortable home. He can command a capital of $3,000, and asks where, within easy reach of N. Y. City, can an eligible place be found for beginning moderately mixed farming with considerable attention to the raising of fancy poultry, pigs and small fruits.

ANS.—We would gladly give you the advice you ask, were we competent to do so. We regard farming as a paying business—as a safe, dignified, noble pursuit. But there are thousands who fail in it the same as in other occupations. Success depends upon the man and upon the farm chosen. The sum of $3,000 is a small amount to begin farming with, and unless you are exceptionally well fitted for the work, you would fail. We would advise you to work for not less than one year under some intelligent, generous farmer, who would give you a home and his advice for your services.

L. E. McO., Ghent, Ky., received a bill of peach, apple and pear trees and Sharpless Strawberries, from Truetts' Son & Morgan, of Nashville, Tenn., which were set out with due care on the day they were received, but the Strawberries failed to show any signs of life, and the trees rightaway began to turn black and the bark to slip off as if they had been scalded. He cut off some of the branches and mailed them to the firm, requesting them to refund the money or send sound trees and plants such as he had contracted for; but no answer having been vouchsafed to this letter, he asks whether there is any means by which he can get back his money or its worth.

ANS.—The firm should at least reply to your letter. If you can prove the above statements to be correct, you can recover. The trees etc., may have been delayed along the route, for which the firm could not be held responsible.

G. G. B., Manchester, Vt., asks 1, what is the value of the Iron-clad Manufacturing Company's metallic shingles; 2. do metallic spouts injure maple trees more than wooden ones; 3, what would be the likelihood of success with blue grass, orchard grass and red top sown in the fall with winter grain.

ANS.—1. We cannot say from actual knowledge; but are inclined to think them much better than wood or slate. 2. No. 3. Spring sowing is preferable. There is too much risk in fall sowing, unless made as early as August 15, with an open winter. Much of the winter's seeding done last fall is killed outright by the open and changeable winter.

W. C. W., Boston, Mass., asks, 1. for a reliable nursery where he can get just what he orders; 2, where can he get the Duchess Grape illustrated in the RURAL Dec. 6th, 1879? 3 Name five varieties of Grapes that are likely to succeed in Massachusetts, besides the following which he already has:—Concord, Hartford Prolific, Delaware, Diana and Catawba. 4. Name the best white Raspberry.

ANS.—1. We must refer you to our advertising columns. We advertise none but reliable firms. 2. Of Farley and Anderson, Union Springs, N. Y. 3. Try Rogers's No. 9, Martha, Maxatawney, Rebecca, Walter. 4. White Antwerp and American White. Both of them are surpassed by varieties of darker color.

J. S., Urbana, Kans., says, "My peach trees have a gluey, waxy substance oozing out, right at the top of the ground; on examining, I find a white worm working on them just beneath the surface of the ground. It looks much like a grub worm, only smaller. Will you please inform me through the RURAL what the remedy is?"

ANS.—It is the peach borer. Paint the trunk with sulphur, lime, whale-oil soap. Paste-board around the stems and breaking lime about them are recommended. Wherever the gum exudes (or near it) a borer-grub will be found. Follow with a sharp knife and destroy all found.

F. B, Louisville, Ky., asks the price of Willards Practical Diary Husbandry and Willard's Butter Book, and whether there is any later and better work on dairy matters.

ANS.—Willard's Dairy Husbandry, $3; Butter Book $1. Prof. Arnold has published a later work of which good reports have reached us. The latest, best and in every way the finest work on the entire subject of dairy husbandry, however, is Dairy Farming, by Prof. J. P. Sheldon, now being published in monthly numbers by Carsell, Petter, Galpin & Co., of this city. Nine numbers have been already issued, price 40c. each, and the work will be completed in about 24 numbers.

G. W. M., Greenville, O., asks, 1, what is a good work on tobacco culture, and, 2, whether there is any paper devoted to that industry.

ANS.—Tobacco Culture by Fourteen Experienced Cultivators, 25c., is the only work on that particular branch of the subject we know of, though there is a large number of European works that treat of the culture, manufacture and adulterations of the weed. The Am. News Co., N. Y., will supply the above work. Almost every year all good agricultural papers tell the whole story. 2. The Tobacco Leaf, 142 Fulton Street this city, a weekly, $4.20; the Commercial and Tobacco Leaf, Richmond, Va., a weekly, price $1 a year.

H. C. B., Poteau, Ark., asks, 1, whether there is any cheap way of killing or getting rid of sassafras sprouts; 2, what it is the best kind of fertilizer to apply to corn in the hill, to give it a start; 3, what is the best means of restoring vigor to an apple tree—tree about 15 or 20 years old.

ANS.—1, We know of no cheaper way than by cutting them down as soon as they are in full leaf. 2, Fine bone flour; or hen manure, applied as often directed in these pages. 3, Cut out all dead branches and thin out where the branches are too thick. Then give the ground a generous spread of manure.

E. C., Cylone, Polk Co., Neb., and his neighbors have for three years given their strawberry beds the best care, the plants have blossomed freely, and still there has not even a sign of a berry. The plants were sold for Wilsons. He wants to know what can be the matter.

ANS.—The plants are all staminate, that is, the flowers possess only the male element or stamens, while the pistils are entirely wanting; a kind of bachelor brotherhood from which no fruit can be expected. The Wilson Strawberry has perfect flowers.

M. B. T., North Loup, Neb., would like to know the proper season to transplant evergreens.

ANS.—Evergreens have been moved successfully at almost every season of the year. Some persons advocate one period and others another. The early spring, however, seems to be the most favorable time. Winter or late autumn is recommended for the removal of large trees. Some kinds admit of being moved at midsummer; but care must then be taken lest the young growth droop.

J. W., Martins Ferry, O., is going into the gardening business, and more particularly, in the raising of strawberries, asparagus, rhubarb, celery and grapes; but he complains that he doesn't know how to go to work, and asks information as to the details of the cultivation of each.

ANS.—We would recommend an apprenticeship of a couple of years with a first-class gardener. The information we could offer on so many broad subjects in the space here at our command, would be of no advantage.

J. K. M., Falmouth, Me., asks, 1, whether seedling plum trees will produce fruit like that of the parent, or should they be budded; 2, will Lucern and other grass seeds "catch" when sown in sod or unplowed ground.

ANS.—1. Highly uncertain; budded. 2. The ground for Lucern should be thoroughly tilled. See History of a Poor Farm and article by Prof. Beal in a late issue for sowing other grasses.

C. D. Carrin, Lockport, N. Y., asks which kind of fertilizer is the best and cheapest.

ANS.—That will depend on the crop for which it is intended a good deal, but mainly upon the condition of the soil to which it is to be applied. The question is far too broad to admit of a satisfactory answer in these limits. Barnyard manure is doubtless in most cases the best and cheapest. For commercial fertilizers see our advertising columns and Market Reports.

M. L. H, West Salem, Wis., asks, 1, would the Japanese Maples be hardy there; 2, can the Rhododendron be grown in the house the same as the Oleander; 3, he has tried the Cow-pea there but it did not ripen.

ANS.—1, Perhaps some of our Wisconsin friends can answer this question. We should doubt it. 2. Not satisfactorily. 3. It is worth a good trial.

G. O. T., White Plains, N. Y., referring to our statement in RURAL of Jan. 19, 1878, that we had two Bassett American Plum trees, asks whether they have borne fruit yet and if they are curculio-proof.

ANS.—Yes, they have fruited with us. The plums are very small and *not* curculio-proof.

I. F. W., Palmyra, Neb., wants to know who manufacture the Centrifugal Creamer.

ANS.—There are two kinds of centrifugal creamers—as stated in a late RURAL. One is made by Whitman & Burrell, Little Falls, N. Y.; we do not know who makes the other, if it is manufactured at all in this country.

E. F., Kingston, N. Y., asks how to raise Bouvardias and Azalcas.

ANS.—Bouvardias and Azaleas require no special treatment. Mellow soil, a sunny window and water—the same as Geraniums need—are their chief requirements. Most Azaleas are hardy. The Bouvardia may be used for bedding purposes, from frost to frost.

J. N. B., Worcester, Mass., asks where the Ring Willow can be had.

ANS—We suppose our correspondent means Salix annularis. It can be had from The Parsons Son's Co., Flushing, L. I.

F. A. M., N. Y. City., asks whether it would be advisable to sow the flower seeds of the Free Seed Distribution in pots in the house instead of in a hot-bed during the warm weather.

ANS.—Yes.

Nell, Cameron's Mills, Pa., asks how to destroy the little white worms that infest the roots of house plants.

ANS.—Use tobacco water. Lime water is excellent.

R. E. C., Waynesville, Ohio, asks how the seed of Cobæa scandens can be obtained.

ANS.—Plants started in the greenhouse and put out in May generally mature seed.

J. M. B., Economowoc, Wis., asks whether the Canton Tea Company of this city is reliable.

ANS.—Yes.

Miscellaneous.

WHAT OTHERS SAY.

SELECT LIST OF NEW, RARE, OR VALUABLE PLANTS OF MANY KINDS.—The following new, rare or valuable plants are taken from the catalogues of the season, which have been noticed from time to time in the RURAL NEW-YORKER. They are only those which seem to us worthy of special notice.

NEW ABUTILONS (for bedding, for the sitting-room or green-house). 1. Anna Crozy—An elegant new English variety, with immense globular flowers of a very soft rose color. It blooms freely and continuously all the season. 35 cents. 2. Arthur Belsham—Flowers, large and of good form, clear crimson, without markings on outside; brilliant and attractive, of vigorous habits Distinct. 35 cents. 3. Blandii—A magnificent flower of a deep yellow color, richly veined with dark crimson, and reticulated with light crimson. Blooms freely. Fine. 35 cents.

NEW AGERATUM.—"QUEEN." This is as near as can be described, a silver or a gray, quite a new color, not easily defined, and when planted in a mass (it averages 10 to 12 inches high) it has a good effect. Blooms most profusely far into November in England.

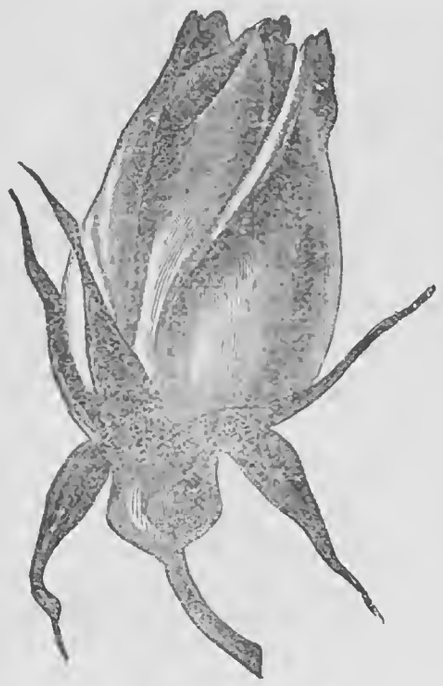
GRAND DUKE NICHOLAS.—A new Hybrid Perpetual Rose introduced from Paris; grand size, very full form, perfectly double, exceedingly fragrant; color, dazzling crimson, brightly flamed with intense scarlet.

DIANA.—Cupped form, large, very double and fine; beautiful, deep pink, changing to clear rosy flesh; petals prettily bordered with purplish crimson.

MRS. LAXTON.—Extra large and fine; perfect shape, very full and fragrant; deep rosy crimson, beautifully flamed and shaded with bright scarlet.

NEW ROSE, "PERLE DES JARDINS." The buds of this Rose are nearly equal to those of Maréchal Niel, but as it is a true Tea bush Rose and not a climber, it is more valuable for general purposes; blooming freely when planted out from young plants the first season, which the "Maréchal Niel" will never do. Color deep yellow; buds large, full, and finely formed.

TEA ROSE, "NIPHETOS." This is the Rose par-excellence. Color of the purest white; large, full, fragrant. It grows dwarf and compact, and flowers in great profusion, nearly



TEA ROSE NIPHETOS.—FIG. 119.

every shoot producing a bud. It is now grown almost exclusively as being the best White Tea Rose, either for winter or summer. Ever in bloom, and possessing all the qualities in a Rose. (*See Cut*).

GEORGE PEABODY.—Extra large flowers; fine cupped form; very full and double; splendid glowing crimson, changing to purplish scarlet; exquisitely Tea-scented; a superb Rose.

JULES CHRETIEN, NEW HYBRID PERPETUAL.—An exceedingly beautiful flower, very bright crimson shaded with purple; very large, full, and of the finest form, among dark brilliant Roses this is the finest. A vigorous grower and free bloomer. A superb Rose.

RUELLIA MACRANTHA.—A Brazilian plant. Flowers freely, of a fine violet-carmine, a pleasing color. This plant is of free growth in a warm house, flowering profusely. One of the finest winter-blooming plants of recent introduction.

NEW WHITE HYDRANGEA, "THOS. HOGG."—It has now been very generally distributed over the country. To those who have not yet obtained it, we would say, that the flowers are pure white, often measuring 10 inches in diameter; the plant, when fully grown, covering a space of five feet in diameter—making it a valuable plant for cemetary decoration or other purposes. It is hardy with a slight protection of leaves in winter.

NEW COLEUS—DREER'S HYBRIDS.—The color combinations of these are very remarkable. They seem to be offered by all florists.

NEW MONTHLY CARNATION, "SNOWDON."—Its merits are that the flowers are of the purest white, borne in profusion on plants that rarely ever exceed one foot in hight. This quality of dwarfness makes it exceedingly valuable.

CATALPA, — Syringæfolia aurea — Leaves large and entirely suffused with a permanent golden color, giving a beautiful warm tint to the foliage. A remarkably handsome tree, with noble foliage of peculiar character and long clusters of fragrant, white, varicgated flowers in August.

CORYLUS—Avellana pendula.—A handsome weeping variety of the Filbert.

DAPHNE GENKWA.—A beautiful, slender, upright-growing shrub, with numerous long, downy twigs, which in early spring before the leaves appear, are thickly garnished with violet-colored tubular flowers, rather more than one inch long. It seldom attains the hight of more than three feet, has fine delicate foliage, and may be classed among the best of our flowering shrubs.

MAGNOLIA HYPOLEUCA.—One of the most attractive of this large family, on account of the fragrance and lateness of its bloom. Flowers milky white, resembling those of Conspicua, but larger, with a most delicious, banana-like odor, and appearing about the middle of June. Foliage bright and attractive, with the underside of the leaf whitish. A great acquisition.

NEW DOUBLE GERANIUMS — Candidissima plena.—Very large, full, and finely formed flowers of the most pure snowy whiteness, not becoming tinted with rose as the flowers fully expand. A really first-class Geranium. Grows vigorously and profusely all the season. We know nothing of this plant, and merely give the catalogue description. Striped Vesuvius—Very distinct from all other Geraniums. Quite double, scarlet ground striped with white and salmon. Will prove acceptable to the most select collection of Zonals, either for the conservatory or for bedding purposes.

NEW IXORA—I. Regina.—An extremely attractive and distinct plant, freely producing large, dense trusses of flowers of a rich violet salmon color.

NEW LANTANA—Surprise.—A fine new variety of robust growth. It produces immense round fringed trusses of fine large flowers of a bright yellow color, changing to rich red with dark center. This is fine as a bedding plant blooming constantly.

TURNIP—"Extra Early Purple Top, Munich."—A remarkably handsome and very early turnip, with a bright purplish red top, and fine mouse-tail root. It has been grown during the past season in the Gardens of the Royal Horticultural Society at Chiswick, where it proved to be three weeks earlier than any other variety sown on the same day and side by side with it.

MELON, "NEW SURPRISE."—Said to be the finest of all musk-melons for Northern localities, with thin light-colored and fine-netted skin and deep salmon-colored flesh.

PEAS, "LAXTON'S MARVEL."—A new three feet, main crop, wrinkled Marrow Pea, raised by Mr. Laxton by crossing Prolific Long Pod with Veitch's Perfection, and tried by the Royal Horticultural Society at Chiswick and awarded a first-class certificate. The pods are large, and contain from eight to ten peas of exquisite flavor It is said to be the best of Mr. Laxton's productions.

CABBAGE, "EARLY ARCTIC."—A new very hardy cabbage from Russia.

BEANS, "DWARF FRENCH EMILE"—Superior and very tender dwarf, and well adapted for forcing. Per quart. 7 cents.

CUCUMBER, "EARLY WHITE JAPAN."—Very early, and assuming a pure white color from the time of formation; quite distinct.

SQUASH, "LITTLE COCOANUT."—A beautiful little winter squash, the size of a cocoanut, cream-colored with green bottom, fine-grained, and of first quality.

WHITE RUSSIAN SPRING WHEAT.—In our tests of spring wheats two years ago, this stood about first in yield. It has since been tried over an extensive range of spring wheat territory, and the reports are all very favorable.

LETTUCE. — Black-Seeded Simpson. — This Lettuce was offered last season for the first time. Like the ordinary Curled Simpson, it does not properly form a head, but a compact mass of leaves; but differs in being very much lighter-colored, the leaves being almost white; stands the summer heat excellently and attains a size nearly *double* that of Curled Simpson.

CORN,—Egyptian Sweet.—This has been grown near Baltimore, Md., for some time. The ear is of large size, and the flavor peculiarly rich and sweet.

CHINESE HULLESS OATS.—The berry comes from the heads as clean as wheat, without hull or chaff adhering. The grain is white. These were among the oats tested at the Rural Farm last year. If left until fully ripe, a good deal of grain is lost.

GOURD.—Dish-Cloth.—There is nothing new about this Gourd, but it is curious, and always more or less inquired about. It forms rather curious, novel-looking fruit, the lining of which is sometimes utilized as a dish-cloth, hence the name.

CONVERSION OF CANE SUGAR INTO GRAPE SUGAR IN COOKING.—At a sanitary convention in Grand Rapids, Michigan, recently, the President of the State Board of Health called attention to a bad practice among cooks, by which cane sugar is converted into grape sugar in cooking, thereby losing more than half of its sweetening power. Some women, he said, will put the sugar in with a mass of acid fruit to be cooked, and keep cooking and keep adding sugar while it keeps on growing sourer, until at last they will use two and a half times as much sugar as they ought to, to secure the desired result. The cane sugar has been changed to grape sugar. Now, if the sugar had been added after the fruit was cooked, much less would have been required, and the result would have been far more satisfactory.

GLUCOSE FROM RAGS.—The *Revue Industrielle* states that a German manufactory is turning out over a ton a day of glucose made from old linen rags. These rags, which are composed of hard vegetable fibers, are treated with sulphuric acid, which converts them into dextrine. The latter product thus obtained undergoes a washing with milk of lime, and is then treated with a fresh supply of acid stronger than the former, when the mass is at once transformed and crystallizes into glucose, of which "rich" confections and jellies may be made. The process is said to be a very cheap one, and the glucose chemically identical with grape sugar. A strong outcry, however, has arisen against the manufacture of grape sugar from rags, and the enterprise is understood to be in danger of being interfered with by the German Government.

PEARS FOR MICHIGAN.—For succesion I can give nothing preferable to the following, says President T. T. Lyon in the Michigan Farmer, arranged in the order of ripening: Doyenne d' Ete, end of July and beginning of August; Tyson, middle and end of August; Fondante d' Automne, (Belle Lucrative) middle of September; Louise Bonne de Jersey, end of September and October; Seckel, October; Beurre d' Anjou, November and December. To lengthen the season to February keep the last, or add Winter Nells.

THE fortune of England's Queen is a profound secret. It is known that she has an allowance of £385,000 a year from the nation; that she receives about £40,000 a year from her Duchy of Lancaster; and that the legacy bequeathed to her by the eccentric miser, Neild, amounted to £500,000; but beyond that the public knows nothing. The royal revenue is appropriated to three departments; the Lord Chamberlain, Lord Steward and Master of the Horse. Besides this, £36 000 are left over for contingencies, and £60,000 a year are for the Queen's private expenses.—The Hour.

Sorghum Sugar.

Mr. C. M. Schwarz, Edwardsville, Ill., who is one of the foremost and most successful manufacturers of sugar from the Amber cane, and who has several times given to our readers the results of his experience, writes us as follows: "I send you two samples of Early Amber sugar, which I have been draining out to day on a hand centrifugal. It drains very readily in about two minutes. The sample on top was not boiled for sugar, but only for table sirup, at 228° density, and will yield only about two pounds of sugar per gallon. The other sample at the bottom of the box was boiled dense, as for sugar, at 233° Fahr., and turns out about five pounds per gallon; both were boiled in the open fire-pan. The process is the one that has already been published in the RURAL NEW-YORKER. I feel now perfectly sure of success, and am about enlarging my works with the assistance of two other gentlemen of large experience. I do not advise any one without the necessary experience to invest heavily in the business, for he would fail, unless sirup was aimed at. This would probably turn out a small percentage of sugar without injury to the sirup." The two samples of sugar were duly received, and we found them to differ perceptibly both in color and flavor. The sample that had been boiled at a density of 232° was decidedly the lighter in color and the sweeter. Both were of excellent quality and will compare favorably with sugar from the Southern cane.

PITURI: A NEW NARCOTIC.—It is a marvelous circumstance that the black man of Central Australia should have dropped upon the same narcotic principle (nicotine) as the red man of America. Piturl, is a plant not far removed from the tobacco plant, which grows in Central Australia. The leaves of the plant are chewed, by the aborigines who trade with it far and wide. The plant yielding it has been determined by Baron von Mueller to be the Anthocercis or Duboisia Hopwoodii, *alias* D. Pituri. Chemical analysis shows that the alkaloid, on which the peculiar poisonous properties depend, is nicotine, the same substance to which tobacco owes its effects. Pituri causes extreme retraction of the eyeballs. It is much sought after by the natives, who will give anything they possess for it, not for the purpose of exciting their courage, or of working them up to fighting pitch, but to produce a voluptuous dreamy sensation, such as the opium eater experiences. The natives in some districts are said never to travel without it on their long marches, using it constantly to deaden the cravings of hunger and to support them under excessive fatigue. King, the survivor of the Burke and Wills expedition, who had lived seven months with these natives when rescued by Howitt, states that when his food became so scarce and bad as barely to support life he sometimes obtained a chew of Pituri, which soon caused him to forget his hunger and the miseries of his position.

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

BULLETIN 38.—APRIL 3, 1880.

Fertilizer Analysis.

347. 354.–Concentrated Privy Guano, manufactured by Pollard & Cook, Providence.

No. 347 sampled by the manufacturers and brought to the Station Jan. 16, by F. C. Cook, 119 Ellsworth Ave., New Haven.

No. 354 sampled by F. C. Cook, in February, from lot of ten tons purchased by him. Cost, $65 per ton.

COMPOSITION.

	347	354
Moisture	5.10	
Organic Matter (Nitrogen—0.50)	7.93	
Ammonia " 4.06	4.93	
Nitric Acid " 10.03	38 70	
Phosphoric Acid, soluble	7.76	
Sulphuric Acid	4.71	
Chlorine	.22	
Soda	2.06	
Potash	24.90	
Lime	3.10	
Magnesia	trace	
	100.00	
Total Nitrogen	14.59	14 29

VALUATION OF 347.

	lbs. ℔ T.	Val. ℔ lb.	Ton Val.
Nitrogen of nitrates	200.6	26 cts.	$ 52.15
" ammonia	81.2	23½ "	18.27
Organic Nitrogen	10.0	20 "	2.00
Sol. Phos. Acid	155 2	12½ "	19.40
Potash	498.0	7½ "	37.35
Total Estimated Value			$129.17
Cost			65.00

This Privy Guano has an unmistakable privy odor, but, unlike night soil, it is almost entirely soluble in water, and unlike both night soil and urine, it consists mainly of nitrates and phosphates of potash, ammonia and soda. It is not manufactured from night soil, although it is flavored with this last named substance. Its commercial value is almost double its cost, a fact that would be very welcome to the consumers of fertilizers if it could remain a fact. But a "Privy Guano" of this composition cannot long be afforded for much less than $130 per ton, and the extraordinary value of the two samples that thus early have found their way to the Station, should put purchasers on their guard against a sudden and great decline in its composition and value.

Any parties who have laid in a supply would do well to have samples analyzed before waiting for a crop, and should remember that the first fertilizers bulletined by the Station (in August, 1877,) were Pollard's "Composition for Grass," of which the cost was $32, and the estimated value, $1 03, and Pollard's "Composition for Vegetables," cost $32, estimated value, $0.99. S. W. JOHNSON, Director.

CATALOGUES, ETC., RECEIVED.

NOTE.—Readers are referred to our advertising columns for any particulars omitted in the following necessarily brief notices:

HOOPER, BRO. & THOMAS, West Chester, Pa. Better late than never. We are in receipt of several catalogues from this good old firm. One is a circular of the choicest flowers in collections at wholesale prices—a capital idea. For instance 12 Roses in 12 varieties are offered for $1 00. Another is a Cheap List of Evergreens and Fruit trees and the prices are, indeed, astonishingly low. Last but not least is their Hand-book of Beautiful Flowers, Greenhouse and Bedding plants, 80 pages, illustrated. Our readers may promote their own interests by sending for them all.

SEYMOUR, SABIN & CO., Stillwater Minn. Catalogue of 20 pages setting forth to all interested in grain-trashing machinery the many advantages of the Minnesota Chief Separator. This machine has been well-tried both at home and abroad and has well proven the validity of its claim to stand at the head of modern thrashing machines. The catalogue is fully illustrated and will be sent to all applicants.

BRIEF ESSAYS on New Fruits, Ornamental trees and plants, by William C. Barry, Mount Hope Nurseries, Rochester, N. Y.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

CONDUCTED BY
ELBERT S. CARMAN.

Address THE RURAL NEW-YORKER,
78 Duane Street, New York.

SATURDAY, APRIL 17, 1880.

REMOVAL.

On and after May 1st of this year the Rural New-Yorker will occupy its new quarters, No. 34 Park Row, corner of Beekman Street.

SPECIAL NOTICE.

We beg to state that we should be pleased during the coming season to receive from those engaged in raising or testing new fruits of any kind, average specimens of such as may seem to be worthy of general cultivation. We should also be pleased to receive specimens of new grain, roots or vegetables, that seem to be superior to well-known varieties of their respective kinds. Our object in making the request is that we may have them drawn and engraved for the benefit of all who may be interested. It is desirable that specimens so sent, and the letters describing them, should be so numbered or designated as to provide against the possibility of error when opened in this office.

It is reported that the Superintendent of a beet-sugar factory at Ingendorff in Germany, finding that mice were somewhat redundant on his premises, offered a bounty of a quarter of a cent for each mouse, with the result that in the course of ten days 84,000 dead mice were handed in to him.

There are a score or more of horticultural writers who, whenever they deliver an address, write an essay, note or article of any kind, send manuscript copies of it to the leading agricultural journals of the country. The articles are usually of some value and are very generally published. Notoriety or free advertising—though ingeniously disguised—is, as a rule, the compensation anticipated for the trouble and expense incurred. We beg to state that the Rural New-Yorker does not stand in need of such articles and that the authors, by leaving us out of their lists, will place us under obligations.

We are always pleased to secure short, practical notes from our readers, and are always glad to find space for an interchange of experience, criticism and opinion. But we take for granted that what is freely given away is no longer the property of the donor.

There would be a "boom" just now in wool if there were enough of the domestic product in the market to supply the demand. There is, perhaps, no branch of agricultural industry that is likely to pay so well for at least the next decade as wool growing. For the coming season high prices are assured. All over the country manufacturers are contracting for the next clip at very high figures, while wool growers are in many places in no hurry to close bargains, preferring to wait for still better prices later on. With the constantly increasing demand for wool in this country and the present great inadequacy of the home production, all enterprising men can engage in wool raising without any fear of overstocking the market for the next ten or twelve years. If in the meanwhile wool goes down, it will be because other products do so likewise, not because the supply will exceed the demand. Foot-rot has destroyed a large proportion of the sheep in England, drought has done the same for thousands, aye, millions, of those in Australia and Buenos Ayres; while Russia also has lost heavily from disease, so that with an increasing demand for wool, the supply for some time is likely to be smaller.

A bill is now before the legislature of this State for the suppression of tramps. The safety of the rural population, the abatement of an intolerable nuisance, and the well-being of society urgently demand prompt legislation to this end. Already the hordes of shiftless, filthy, idle, lawless vagabonds, that during the severity of the winter have found a wretched shelter in the slums of our cities or in their charitable or penal institutions, are meandering into the country, a grievous burden to the rural population and a terror to lonely wayfarers and isolated homesteads. Most of the New England States have already been cleared of these vagrants by laws, which for the last year or two, have made the Eastern highways hard roads to travel for them, and, unless similar enactments are enforced against them here, we shall not only be troubled with our usual proportion of these rovers, but shall be overwhelmed with the New England quota, likewise. During the "hard times," now happily over, there is little doubt but not a few really respectable workers were forced to "take to the road" in search of employment, but in these days the number of these, always comparatively small, has dwindled into insignificance, and the tramps of today may, with certainty, be set down as a lazy, unscrupulous, dangerous crew, whom it is the duty of the State for the protection of its citizens to suppress with a prompt and vigorous hand.

The New Jersey county bill to encourage the production and treatment of fibers in the State, has become a law. By its provisions, cultivators of hemp, flax, ramie and the plants of the mallow family, will be paid out of the State Treasury from five to ten dollars for every ton of fiber stalks grown, and from two and one-half to ten cents for every pound of cleaned fiber prepared, subject to certain requirements. The idea of advancing the interests of any special branch of agriculture by the bounty system, may strike some as decidedly un-American, and inconsistent with our usual methods of doing things. There are many arguments in favor of the payment of bounties in particular cases, and for intelligent fiber cultivators it seems appropriate enough at the present time. The mighty dollar is a powerful spring with which to start the machinery of any new enterprise. Farmers are loth to enter new fields of industry until there is the promise of speedy return for their labor. There are numbers of new fibers which experiment has demonstrated can easily be grown—some of them indigenous—which in such a country as France would have been utilized long ago. Machinery has recently been invented for the proper cleaning of these fibers, and manufacturers say they will be glad to purchase them, judging from samples submitted. Under such circumstances, it is thought that a little fostering help from the State will set in motion the wheels of a new industry, which will result, in time, in a large return for the outlay.

There has been a great deficiency in the supply of American hemp, which has forced the manufacturers to import largely from Russia and Italy. There is a consequent demand for Kentucky hemp, and it is stated that the farmers of Kentucky are going wild over hemp cultivation. Large contracts have been made for the crop of 1880 at $5 for 112 pounds; seed is being purchased at $3 per bushel, with a prospect of its rising to $5, and land rented at $10 to $12 per acre. This is all very well if it is not "run into the ground" completely and the "fever" does not spread throughout other hemp-growing States. It is one of the unpleasant phases of fiber production in this country, tending to produce an irregular supply and in a measure to demoralize legitimate industry, that when the price is high, there is little fiber upon the market, and everybody goes into its production pell-mell. In the mean time the manufacturers "load up to the eyes" with the foreign product, making contracts ahead. The new crop comes on; good, bad and indifferent are pushed upon the market, and—"There's no money in hemp, sir—I've tried it."

What is most needed in flax and hemp cultivation in this country is more knowledge and experience, both in growing the plants and in preparing them after they are grown. It is in one sense a trade that is to be thoroughly learned and followed after it is acquired. It is only by long practice and experience that the Irish and Dutch flax-growers are enabled to hold their own in any market. It is too much the practice of many farmers to dive into the latest sensation—hap-hazard, trusting to luck and good prices—ready to leave it as quickly for the next golden promise, be it sugar-beet culture or wool growing. It is not to be understood that the farmer must grow flax or hemp and nothing else, but he must stick to the cultivation of a certain amount with other crops—if he wishes to grow it at all—year by year gaining new experience and skill which will eventually enable him to compete with European cultivators, climatic condition being equal. Thus a steady supply is created, which in the long run will be productive of a legitimate industry and prove a source of wealth to the country.

Of the 22 members of the Congressional Committees on Agriculture and Manufacture, six came to this city last Friday to accept the invitation to a "glorious spread" at Delmonico's, tendered to them by the Commercial Manufacturing Company, one of the most extensive manufacturers of oleomargarine in the world. As a perfunctory preliminary to the main object of their visit, they walked through the fat factory, which had been nicely prepared for their cursory inspection, and, just as they acted in Baltimore, the other day, under similar circumstances, they were civil enough to please their courteous entertainers with effusive assurances of their entire satisfaction with what they there beheld. To sharpen their appetites for the evening's feast, the legislative junketers next took a pleasure trip down the Bay, but returned in ample time for the soup and the "salmon." The names of this galaxy of worthies should not remain unknown to rural fame, so here they are:—the Hon's. James B. Richmond, of Virginia; D. Wyatt Aiken, of South Carolina; Jonas H. McGowan, of Michigan; Walter L. Steele, of North Carolina; Albert P. Forsythe, of Illinois; and John A. Anderson, of Kansas. They were accompanied by the Hon. S. W. Downey, of Wyoming, and Col. G. C. Ellison, clerk to the House Committee. They all claimed to be farmers; but while the Congressional dictionary acknowledges that Aiken and Forsythe do some farming, it puts the others down as lawyers. What did they say at the banquet? Why, what could they say except to extol the works and ways of the gentlemen who were entertaing them so generously, regardless alike of expense and public decency. For it is not often that the methods of the lobby are so flagrantly brought to bear upon the formation of congressional opinion in a matter in which so vast an interest is vitally involved. It will not be the fault of the oleomargarine men if these complaisant Representatives of the People do not report in their favor, and, anyhow, they have already got from them a first-class advertisement.

A PARK AT NIAGARA FALLS.

Niagara Falls, the pride of America and the wonder of the world! Who that ever, for the first time, visited these majestic cataracts was not impressed with awe and admiration at the scenery presented! The mighty rush of the waters, the roar, the rocks, the chasm, the mist, the forests, all unite to form one of the grandest scenes to which nature has given birth. Add to this the historical interest connected with the place, and that marvel of modern engineering skill, the large Suspension Bridge, and there are but few places in the world, and none in the United States, more apt to attract visitors, both from home and abroad. The beauty of the natural scenery has, however, in the last few years been much defaced by the cutting away of the forests, the erection of dwellings, manufactories, sluiceways, etc., which now make their obtrusive appearance on the cliffs and in the whirling waters. The water-power here afforded has proved too great a temptation to American enterprise. But if this enterprise is allowed unchecked sway the defacement of the scenery will continue and increase year by year till the once beautiful surroundings will be robbed of their attractions and the place littered with rough manufactories. The Governor of New York called attention to this fact in his message of last year, and by the direction of the State Legislature a Commission was appointed "to inquire, consider and report what, if any, measures it may be expedient for the State to adopt for carrying out the suggestions contained in the annual message of the Governor with respect to Niagara Falls." The members of this Commission have now made their report to the legislature. They find that the private holding of land has worked great destruction to the scenery, that this destruction is accelerating, and recommend that the State purchase the land surrounding the Falls, including the islands in the river and convert it into a national park for the benefit of the public.

This proposal merits universal support. It is only what should have been done years ago before obtrusive buildings had been erected and the scenery defaced. It is only what the general Government has done in similar cases. In 1865 the settlers near Yosemite Falls were dispossessed and the land reserved for the public; a large portion of the region of the geysers on the Yellowstone River has also been set aside as a national park. Niagara, being better known and more easily accessible to all the world than either of these, it is of much greater importance that the scenery should here be preserved. Moreover, if the land becomes public property, there are faint hopes of a reduction of the outrageous charges to which visitors must now submit if they will enjoy the sights to advantage. These charges have become proverbial for their unreasonableness. Every foot of space from which a charming view of the Falls can be had, is private property and is made to yield the highest possible income by letting it to visitors. Private enterprise is lawful, commendable and necessary; but when it works to the discomfort of the public and to the destruction of natural beauty, as in this case, it becomes the duty of the authorities to modify and curb such enterprise to the extent it is detrimental to the public.

From the fact that the legislature has manifested so great an interest in the subject we trust that measures will forthwith be taken for the conversion of the land into a public park. The Dominion Government, we understand, is willing to co-operate with the States in the undertaking, and to preserve the Canadian side of the falls. And if New York State should ultimately find that the purchase of the land and the keeping of a park would make too heavy a draft upon its treasury, then let the general Government take the matter in hand. The world-renowned Niagara Falls should forever remain accessible to and enjoyable by the world.

BREVITIES.

The Yellow Paradise stock is recommended by M. Carriere. It is said to be hardier than the common Paradise stock and can be grafted during a longer season.

Very few farmers, we are forced to believe, know what good salsify or vegetable oyster is—that is salsify properly sown and cultivated. If they did, we are confident it would be raised as generally as is lettuce or celery.

Our Farm Story by Charles Richards Dodge will be commenced in the Literary Department of the Rural New-Yorker on May 1st. We trust it will be found worthy of perusal by every farmer, young or old—male or female.

The latest reports about the winter wheat crop are even more favorable than their predecessors. The rains that have, within the last week or two, visited nearly every part of the country, have helped the crop wonderfully in many places.

One more superfluous patent to annoy farmers with! The device for preventing cows from sucking themselves, which was illustrated in the Rural as long ago as December the 6th and which is reproduced in the Querist Department of this issue, has been actually patented by a Yankee worthy, who is now advertising for agents to annoy farmers with the thing. The device itself is good, but why patent it, as it is an English invention fully described in Prof. J. P. Sheldon's Dairy Farming?

The following paragraph from "Thoughts and Events" well support the views the Rural New-Yorker has often expressed:—The aim of a paper should be much higher than that of merely making money for its proprietor. There are better fields of activity for merely mercenary men than journalism, where they can do far less harm to the public, as well as to themselves, and to these let them confine themselves. The press should be in itself a representative, as it is already in higher quarters an advocate, of co-operation, each man engaged upon it working always with an eye and a feeling for the general interest, as well as for his own.

From statements in the Pacific Rural Press it appears that large quantities of "bone-meal and flesh fertilizer" are exported from San Francisco to New Zealand, the home demand being small, though increasing. Another curious fact is that the Chinese are in the habit of exporting from California some $600,000 worth of shrimps, shrimp shells, small fish dried and their bones, for fertilizing the tea-gardens of China. The shells and bones are thought to supply the ingredients of which the plants exhaust the soil, and are sometimes carried a thousand miles into the interior. One year the exportation of this material amounted to the value of $900,000.

There is a bill now before the N. Y. legislature to force the manufacturers of oleomargarine under a heavy penalty to mark every package of the compound with the word Oleomargarine in distinct letters three inches long, and making it an offence punishable by fine or imprisonment for any dealer to sell from packages not marked in this legible way. A bill on the same subject before the legislature of Massachusetts stipulates for letters only one inch long. We expect that the oleomargarine men will give a hearty and unanimous support to both these measures, especially to that requiring the branded letters to be three inches long. They will thus show that they do not lie in saying that they are anxious to sell the product on its merits and will give to the public an honest opportunity of deciding whether this new-fangled bullock's butter is really "superior, sir," to the old sort from the cow.

Everywhere.

RURAL SPECIAL REPORTS.

CAL., Smith's Ranche, Sonoma Co.—We have had one of the coldest winters ever known in California. The cold snap came on about Christmas and continued until about March 25. Consequently feed is short, stock poor and dairy products reduced about one-half; a considerable amount of grain, too, has been winter-killed, and had to be resowed. The late frosts have damaged the early fruits, and in some sections peaches, apricots and almonds are nearly ruined. The acreage in wheat is much larger than last year. The wheat craze has been general. Less potatoes and barley than usual. Good prices for wool have put sheep on the up grade, and many will sell their cows and invest in sheep. Grain, although backward, promises a good crop; but the season will be over a month later than usual, but should it from this on be favorable, the grain crop will be immense. E. H. C.

CAL., Cedarville, Modoc Co.—We do not sow fall wheat in this section. We sowed it two years; but the frost killed it. Since then we have put in our crop in the spring. The spring is backward, we commenced plowing only on March 22. The Hessian fly is not known in this section. The acreage will be much larger than on any former year. We have had a great deal of snow this winter. The prospect for large crops is good. A part of this valley has been troubled with grasshoppers for the past five years and they have destroyed our crops, but as the winter has been very severe, we feel confident we shall not be troubled with the pests this season. C. & B.

CAL., El Dorado, El Dorado Co.—Wheat in our section is backward on account of the very cold winter we have had; much of the late-sown was injured, early-sown wheat is in fine condition. No disease or injury by Hessian fly is now apparent, and with a favorable spring none is feared. In general compared with other years, it is fair to average, a slight advance, in fact, if any thing, acreage larger. Generally a good crop is looked for. W. C. L. D.

CAL., Brighton, Sacramento Co.—We have had a very cold winter; frost almost every night for the last three months, and very little rain for a California winter. The farmers finished putting in their crops, "which is barley mostly," and are summer-fallowing now. In this vacinity we are having considerable north winds which are very detrimental to the growing grain, unless we have more rain, of which there are tokens now. A. M. D.

CAL., Penryn, Placer Co.—The wheat in our section looks better than usual, not being affected by our unusual season. We have no disease and no Hessian fly. Appearances indicate at present over an average crop. Acreage about the same as last season. I. W. B.

CONN., Guilford, New Haven Co.—Wheat as far as I know has wintered well. No trouble from the fly or from rust except in one field. In 1879 wheat was good and yielded well. The acreage is doubled. I sowed clover in the fall of '77 and it did well; in '78 I sowed two fields to rye seeded with clover, the one that was covered with snow did well, the other was entirely killed. J. A. P.

CONN., New London, New London Co.—Wheat doesn't usually do well in this section, consequently there is seldom any sown; rye is raised instead, and that is looking very well. Potatoes rotted badly last year; some farmers lost nearly their whole crop. Hay, strawberries and potatoes are the crops to which we turn our attention. B. G. S.

DAKOTA, Brighton, Union Co.—No fall wheat growing here this season. It is but experimental with us as yet. Grasshoppers destroyed nearly all kinds of grain last year, and as all the fall wheat was lost, we are still undecided as to the variety best suited to this locality, or whether it will pay to grow it largely in preference to spring wheat, which has heretofore held sway and probably will continue to do so. The season being late, we are now busy sowing wheat. Owing to past losses the acreage will probably be one-half; corn will preponderate. Cattle largely increasing. J. M.

DEL., Hollandville, Kent Co.—Wheat in this section looks well. Early-sown has some fly, but looks promising. I sowed the last week in September, again about the 5th of Oct. and again about the 15th of Oct. That sowed in Sept. showed fly late in the fall, but looks tolerably well at present. That sowed about the 5th of Oct. is perfectly healthy and grows rapidly. That seeded about the 15th of Oct. looks well, though not as large as either of the others. So far as my observation extends, the acreage is somewhat largor than last year. G. M.

ILLINOIS, Ludlow, Champagn Co., April 2.—The winter here being open and changeable, was unfavorable to wheat, but its appearance has greatly improved of late and many fields thought to be nearly ruined, now show promise of half a crop; while some fields look really well. The early-sown generally looks the best. Fruit is thus far safe, as the buds have not started enough to be injured. The demand for live stock seems to be unusually good this spring, especially for horses. The low prices of late years seem to have checked the rearing of horses to such an extent that the supply of good, sound, heavy horses has run short, such being wanted now at from $125 to $200 each, while sound plugs and light horses bring $100. Common cows bring $30 to $40; live hogs, $3.90 to $4 ₩ 100 lbs.; chickens, 5c. ₩ lb; corn, shelled, 30c.; oats, 30c.; hay, $7 to $8 ₩ ton. Potatoes vary much in price according to quality; Early Rose, 30c.; Peachblows, 40c. The trimming and laying of hedges and the husking of corn form the principal occupation of farmers here during the winter. A good part of the past winter the corn-fields were too soft to get over with a team, consequently considerable corn remained in the field during winter, and some farmers who, in other parts, might be called shiftless, had to finish husking before commencing spring work. Perhaps in justice to such, it would be only fair to mention that the spring of '79 was late, and the frost in the fall came early; a considerable amount of late corn was scarcely ripe when frost came, and such dried slowly and was unfit to crib in fall or early winter when the work should have been done.

The trimming and laying of hedges is no small item in the round of farm work in this prairie country. The road and outside farm fences are almost entirely of the Osage Orange thorn, and when properly grown it forms a perfect barrier to all kinds of stock. When a few years old, or when the plants are about two inches in diameter at the ground, they should be trimmed and cut nearly off close to the ground, bent over nearly horizontally, and held in place by stakes or woven between stems left standing upright for the purpose, about two or three feet apart. From the horizontal stems upright shoots start thickly, which soon form the complete fence which thereafter only needs an annual trimming to keep it in repair. Many farmers neglect this annual trimming and do the job only once in four or five years; but while the high hedge makes a good wind-break, it occupies more ground, and, on the whole, but little labor is saved as the annual trimming is light compared to the heavy one. G.

ILL., Deer Park, La Salle Co.—Winter wheat looks bad and in some instances is killed outright. Rye promises well. The fruit prospect is very good; apple trees are full of buds. U. S. E.

IND., Canton, Washington Co.—Wheat looks splendid at this writing; there was considerable complaint of the fly last fall, but it shows no effects of it now. Not hurt by the winter, in the least. Acreage at least 20 per cent. greater than in 1878, many farmers use bone meal as a fertilizer, which doubles their crop. This is a good fruit country. Fruits are uninjured so far, and promise a good crop. W. J.

IOWA, Florence, Benton Co.—A great many supposed that the Strawberries were winter-killed entirely; but since the rain they have come up. I think there will be enough of the vines for quite a crop if no mishap occurs. Before the rain the woods and fields were as dry and dusty as they are in August. S. T. S.

KAN., Meadow Brook, Johnson Co.—Our hay crop last year was light, but our grain crops of all kinds were good. We have had plenty of rain, and prospects for cereal and fruit crops are very fine. Land has advanced 40 per cent. H. S.

KY., Paducah, McCracken Co.—We have had a very mild winter—no snow but a great deal of rain. Wheat looks well and bids fair for a good crop, unless it should be injured by rust, as it nearly always is after a warm winter. The Amber wheat yields more than any other sort per acre—from five to twenty-five bushels, according to the land and the season. On March 17th, while Apples and Peaches were in full bloom, we had a sleet storm which injured about half the Apples. The tobacco plants are up and have not been injured by the insects yet. Cow-peas are as common as corn or tobacco with us. A. R.

MAINE, Atkinson, Piscataquis Co.—The fields in this section are well covered with snow and have been all winter, so what little winter wheat was sown is probably safe. The fly injures wheat in some seasons. The acreage is about the same as last year. A. T. P.

MICH., Montgomery, Hillsdale Co., April 2.—Ten days ago the farmers were quite dishcartened in regard to the wheat crop; but the thorough rain of one week ago, followed by an equally effective one of to-day, completely changes the outlook. While predictions continue to be made that we are to have a cold, late spring, the wonderfully mild, pleasant weather of the past month, keeps abreast with the advancing season; and we are fully justified in saying that Southern Michigan will do her full share in meeting the expectation of an abundant coming harvest. It is doubtful if the dairy interests will immediately recover from the discouraging outlook of last September, although some at least regret that they did not wait a little longer before deciding that there was more money in wheat. C. H. E.

MICH., Eckford, Calhoun Co.—The past winter here was the warmest known to the oldest settler. Last harvest was a good one—wheat yielded 18 to 40 bushels per acre, of extra-good quality of grain. Markets:—Wheat, $1.15; oats, 40c.; corn, 45c. per 70 lbs.; clover seed, $4.50; butter, 22c. per lb.; eggs, 10c. per doz. The wheat on the ground looks well, except on low land, on which it had been heaved up by frost and killed badly. Clover is killed very much. W. H. T.

MINN., Ash Creek, Rock Co.—There is very little winter wheat sown in this part of the State, and what little is sown is only in small patches and tried simply for experiment. Our past winter has been very severe and most of the wheat has been killed out, and from all that I can ascertain, I should call the winter wheat raising in this part of Minnesota a failure. Nevertheless, I will put in 15 or 20 acres this fall and give it a fair trial. Seeding was commenced here on the 25th of March, and was pushed vigorously. I started my drags, five seeders and five drags, on wheat on the 24th. This is the region of large farms, although we cannot boast of quite as large a farm as that of Oliver Dalrymple, on the Red River; yet we have in this county the following large farms;—Rock Co. Farming Co., who have a farm of nearly 30,000 acres; the Eau Claire Farming Co. whose farm covers nearly 3,000 acres; the Harrison Farm of 3,200 acres, and also quite a number of farms of from 320 to 640 acres, and lastly Sunnyside Farm of 2,000 acres of which we have about 600 under cultivation, and it will be seeded about as follows:—350 acres of wheat; 80 acres of oats; 30 acres of barley; 20 acres of flax (which is raised here for seed only); 20 acres of millet; 80 acres of corn; 10 acres to garden and trees, and about 10 acres to be used as an experimental ground in which I will test different varieties of oats, corn, flax, sugar cane, spring and fall wheats, potatoes, etc. M. L. R.

NEBRASKA, Lincoln, Lancaster Co.—Wheat little injured by the winter. Early sowed the best. No signs of disease. No Hessian fly in this section of country yet. The appearance of the wheat is as good as the average. Spring wheat is sown here more than fall wheat. The acreage of fall wheat this year is more than double the previous years, and less spring wheat is sowed. O. B.

N. Y., Johnson's Creek, Niagara Co.—Wheat in this section got a very large growth last fall. The winter has been very open with much freezing and thawing, still its color is good, and it is not much heaved out. No disease or Hessian fly that I have heard of. The prospect is much better than usual; acreage about one-fourth larger than common; variety mostly Clawson. J. M. B.

N. Y., Great Valley, Chattaraugus Co.—Little wheat grown here; acreage greater than last year, however, but it has winter-killed somewhat. There has been but little snow this winter, and the freezing and thawing have been hard on it, so that it looks brown and sickly. E. B.

OHIO, Kingsville, Ashtabula Co.—The wheat crop is looking well now. The winter has not hurt it as much as usual. There is no sign of its having been harmed by the Hessian fly. As to the acreage, it is larger than usual, and it shows no signs of disease. A. J. F.

OHIO, Camden, Preble C.—Wheat looks moderately well; but is considerably injured on flat land when not underdrained. Fruit is uninjured and the prospects are fair for a crop. W. M.

OHIO, Mt. Vernon, Knox Co.—Wheat has so far wintered splendidly. I hear no complaints of disease or Hessian fly. More wheat has been sown than for many years past. J. T.

VT., Randolph, Orange Co.—Very little winter wheat is soen in this section. It is too apt to be a failure from various causes. There will probably be a larger acreage of spring wheat put into the ground this year than usual. The variety known as the Lost Nation has done wonderfully well for two years past, and will be the kind used the coming year. It makes a good growth, makes splendid flour and yields an average of thirty bushels to the acre. L. H. R.

Various.

THE RILEY CONTROVERSY.

DENVER, Col., March 20, 1880.

EDITOR RURAL NEW-YORKER—*Dear Sir*:—My attention has been called to a lengthy card of Prof. C. V. Riley, published in your issue of February 21, relating to the severance of his connection with the Department of Agriculture.

He finds it necessary for his purposes to contradict therein the published account of a brief interview I had with him, in the course of which he denied most emphatically that he had circulated slanderous statements regarding the Comsioner.

So far as Professor Riley's statements relate to my connection with this matter, they are false—absolutely untrue both in statement and insinuation. To show the recklessness of his malice, I desire to call attention to his assertion that I was "at one time engaged at a salary in preparing and editing items intended to popularize the Department and laud the Commissioner," and also that I have "been sent to Colorado to investigate mineral lands." These statements are not only false, but there can be no doubt whatever that Mr. Riley knew them to be false when he made them. I was at one time invited by the Commissioner to prepare for publication, in the agricultural press, a weekly bulletin of the reports received by the Department, the intention of the Commissioner being to use, in this way, a large amount of valuable information which must necessarily be crowded out of the annual reports. This idea, which I believe to be an excellent one, was abandoned, because of the difficulty, owing to limited appropriation, of carrying it into execution at that time. Inasmuch as Prof. Riley furnished me with a portion of the matter edited, he must know very well that his statement is untrue. If he had said; "to laud Prof. Riley," I would not have been so much surprised, as the report which he turned over to me was prefaced by a few remarks of a nature calculated to enhance the importance of the Entomologist, which preface it became my painful duty to eliminate.

In regard to his other statement. At the time of my departure, most of the papers at the Capital contained some notice of my mission, which was to examine and report upon the question of irrigation for the arid lands of Colorado and the West. Inasmuch as I am by education an engineer, and have made somewhat extensive personal examinations of systems of irrigation, including that of the Chinese Empire, the press universally spoke of my appointment in complimentary terms. "Prof." Riley, on the outlook for items concerning the Department, could scarcely have failed to see one or more of these notices. I may be pardoned for mentioning, in this connection, that my mission has been so far successful that my suggestions have been embodied in a bill which has already received the favorable consideration of one branch of Congress. When I called upon Prof. Riley with a copy of his malicious utterances to the Courier-Journal, he was aware that I came as the friend of General Le Duc, and made haste to deny that he was the author of the slander. I was very particular, suspecting the idiosyncracy of the man, to write down his exact words immediately upon the termination of our interview. The words published were exactly as uttered by him, with the omission of the one word "damned" before the word "outrage."

It was a notorious fact that after his dismissal—it was equivalent to such—he haunted the offices of Newspaper Row, unrolling, wherever he was permitted to sit down, his scroll of malicious slanders, in the hope of finding some one willing to aid him in his work of detraction. It was at this stage of his career that he came to be alluded to by facetious correspondents as the "Crushed Bugologist."

An examination of Prof. Riley's published fictions will show that they do not hold together—that they are of a curiously contradictory character. Yours truly, JOHN BRISBIN WALKER.

For Women.

CONDUCTED BY MISS RAY CLARK.

ONLY.

EVA EDGERTON.

ONLY a woman with aching heart,
That sits in the firelight's blur,
And muses over the tangled threads
That fate has woven for her.

Only a woman, with hope all slain
And buried within her breast,
That values life but a sad refrain,
And only longs for rest.

Only a woman in woman's pride,
That smiles when her heart is dead,
You cannot tell by her laugh and jest,
That her light in life is fled.

Only a woman that grieves alone
Away from curious eyes;
Grieves for one who sleeps to-night
Out under the autumn skies.

Only a woman that fain would lie
Her head by the dear one's side,
Rather than live her loveless life
That begins this eventide.

TALK ABOUT MY JEWELS.

BY MARGUERITE.

I THINK the reading of "Helen's Babies" awakened many a one to the fact, that the world is full of mischievous children, and although the taking care of them is the purest joy the mother ever knows, still there are times when the body fails in performing all that the heart would gladly do. Therefore, every mother needs a little rest, and running away from children and domestic cares entirely, is the surest way of gaining it.

Thus I reasoned to myself, while Bob kept reminding me of my promise to be present at the University when he graduated. Finally I decided to go, although there were many invisible cords with wonderful strength, that kept binding me to the home circle. I had never left Fred, and it was no easy thing to do, and the parting from John and Gertie at the depot was nearly as difficult. About two minutes before the train arrived, I turned to Gertie and said, one more kiss and love, then mamma is off. Immediately the little arms clung tenderly around my neck, and kisses were given, but in so doing she struck my hat and away it went to the floor. I picked it up hurriedly, replaced it quickly and just had time to get on the train before it drew a long breath and was off, while blinding tears filled my eyes so that I could scarcely get a last glimpse of the home ones. How long the weeks seemed then, that I had planned to be absent and the possibility of sickness or accident occurring came forcibly to mind; but I cast all care on the Father who careth for us, or tried to do so—although we mothers are prone to hold on to one corner ourselves—and attempted to give myself up to rest. It was a perfect June morning, and my journey lay for miles along the beautiful Lake Shore. I had provided myself with one of Miss Muloch's books to read if I wished. There were lady passengers on board who looked so sensible and good, that I could almost imagine them to be pen friends in the RURAL. We conversed together while I sat a little ahead of them, and one remarked, "how much of a study the fellow passengers were to her," while another was en-route for California where my sisters had gone the week before; so amid a little interchange of thought, and such perfect bodily rest, and freedom from care as I had perhaps *never* experienced before, because never before so deserving, I reached Cleveland. Several hours I had to wait there, which pleased me well, as I wanted time to go to the city. I passed into the dressing room to leave a package and see if I was presentable, so I peeped into the mirror behind a dozen other heads. I was some time deciding on my own—the face looked familiar, but the *hat*—but I comprehended finally that it was my own, only when Gertie knocked it off with a "love," I had replaced it wrong end before. I changed it, thinking meanwhile of the solid comfort taken so far on my journey, all unconscious of the mark of Gertie's loving arms. A friend remarked when I told her, "that it made little difference about hats nowadays, as they could be worn either way."

"But there is a difference in hats," I answered, "and I'm sure mine must have been quite a ridiculous affair with my own class badge fastened in its trimmings."

Night found me toward central Ohio, and Rob's dear, strong arms, helped me off the train, and then, like children, we walked away, talking over our hopes and plans, although they had matured as the years added to our stature. There was much to hear and enjoy for the next week. Indeed every hour was full, and in mind I lived over the last of my own school days, while every pulse beat was in sympathy with the beloved brother and his friends on the stage. The meeting of the Alumni, Cook's lecture, the juniors contest, the jollity of Class day and the exercises of Commencement, all were entered into with spirit, and the resolutions formed there for self-improvement, I hope may extend through life. When these were over, I hastened away to see my mother and in a few days triumphantly returned, bringing her with me to my own home for a short visit, and found everything in as perfect order as I had left it. Who can estimate the new impetus brought into this home of ours from the outside world or measure the strength and rest gained for the renewal of life's battle and the training of its soldiers? None on earth. Mothers do not give yourself up to the same work for years, but seek rest in some form, if it is only a *change*, for often a *change* proves a *rest*.

A PLEA FOR UNITING FAMILIES.

Why is it that no two women can live under the same roof, on equal terms, and live in peace? It is difficult for one woman to be cook, chamber-maid and lady of the house at the same time. Two, or even more, would succeed so much better, especially when visitors call. For instance, just as I am finishing my work in the morning Mrs. A. arrives; I usher her into the sitting-room, take her wrappings and sit and entertain her for perhaps an hour, perhaps longer; then it is time to prepare dinner, for hungry men cannot wait; I apologize, and go to the kitchen; Mrs. A. goes too; we scarce get there when Mr. B. enters: he is a dull, common-place sort of a young man, and can be entertained in the kitchen. I no more than get comfortably settled, when Mr. C. knocks; now I am in a puzzle; he is a very dignified, self-important young gentleman, with whom I can really enjoy a visit if I can have him alone, but can do nothing if others are present. While he is bowing and scraping, I take him to the parlor. Mrs. A and Mr. B. take their leave without ceremony. Now while I sit in the parlor and talk nows and nonsense to Mr. C., who is to get dinner for the five hungry men that will be coming in soon? I am almost ready to yield all of my privileges as the only woman in the house, to have some one to depend on in case of emergency. P. E. G.

THE TOILET.

I am economical. I had saved a bottle of sage-tea, alum and honey (prepared for weak eyes) till it became vinegar. Into this I had dropped waste borax and rinsings of bay-water (and let me here add bay-water is an instant cleanser of bottles to which anything adheres, impossible to be got at with a cloth). My practice had been to clean them by agitating sand and soap suds in them, till by accident I rinsed my camphor bottle with bay-water to add to my bottle of toilet water, for which I at length found use. My hair is forty inches long, and through neglect to wear my dusting-cap was being pulled out by the effort to comb it. I emptied my bottle of savings, after heating, into a bowl, and with a nail brush put my head into a lather of castile soap, and washed the two long plats just as I would linen, rinsed and re-rinsed, wrung it in a towel, and combed till dry by a hot fire. It is now soft as silk.

For softening the hands nothing is so fine as a drop each of glycerine and camphor rubbed on before going to bed. The alcohol and glycerine unite and make a white oil or salve very healing and pleasant to use. I always rub it in well immediately after washing. It is good for the lips and eyes also. Mrs. M. L. S.

VISITING CARDS.

A recent writer on this subject says:—"In visiting cards care should be taken to conform with present usage, and to avoid anything considered to be in questionable taste, for a card is the representative of one's self. To the unrefined or underbred person the visiting card is but a trifling and insignificant piece of paper; but to the cultured disciple of social law it conveys a subtle and unmistakable intelligence. Its texture, style of engraving, and even the hour of leaving it, combine to place the stranger whose name it bears in a pleasant or disagreeable attitude, even before his manners, or conversation and face have been able to explain his social position. The higher the civilization of a community, the more careful it is to preserve the elegance of its social forms. It is quite as easy to express a perfect breeding in the fashionable formalities of cards as by any other method, and perhaps, indeed, it is the safest herald of an invitation for a stranger. Its texture should be fine, its engraving a plain script, its size, neither too small, so that its recipients shall say to themselves "a whimsical person," nor too large, to suggest ostentation. Refinement seldom touches extremes in anything."

INFORMATION FOR EFFIE.

In answer to Effie's inquiry I send description of lambrequins which I made last summer. They were made of scarlet opera flannel, lined with very stiff black wiggin The cords and tassels were made of Germantown wool and zephyr. I had two yards of flannel, two skeins of scarlet yarn, one of black, and one ounce of gold colored zephyr. To make the cords I used two strands of red, one of the black, and one of gold color. I made the tassels mostly of the red, mixing some of the black and a very little of the gold. I trimmed all the edges excepting the top, with the cord because it was cheaper than anything else. I also made the fringe between the sections of yarn. I made the cornice of a piece of lath two inches and a half wide. The leaves can be made of black satin and sewed on by overcasting the edges with gold colored saddler's silk, or they can be omitted altogether, and cover it with gilt paper. If Effie should choose this style of lambrequin from among the many kinds which I have no doubt will be sent in answer to her request, she must be governed in quantity by the size of her windows. My windows are small and the lambrequins are only a little over a yard in length. I will add that they were not expensive, and canton flannel may be used if preferred. The pattern used was Butterick's 6628. Kentucky Girl.

ECONOMICAL NOTES.

Where one has a large family for which to provide handkerchiefs it is a good way to buy Lonsdale cambric for that purpose. A yard makes four, and after they have been washed once or twice they are soft and nice for every day use. They only cost from three to four cents apiece and are much cheaper than linen.

A neat little work-box may be made by taking a cigar-box. Paste a piece of strong cloth on the two sides where the lid is hung, secure it with small picture-frame tacks. That is to make the cover fast. Then paste a narrow strip of cloth around the edge of the box; when dry, cover all with ladies' cloth or other suitable material and sew fast to the strip. Cover the lid so that it can be stuffed for a pincushion. Paste pictures on the inside of the lid to cover the cloth binding, and you have a neat little work-box and pincushion combined, which, if well done, is not only convenient, but ornamental. Aunt Rachel.

Literary Miscellany.

SPECIAL ANNOUNCEMENT.

In our issue of May 1st we shall begin the publication of an original Farm Story, by Charles Richards Dodge, the author of "Louise and I," a Sea-side Story, published by G. W. Carleton & Co., New York. It combines the bright, practical, scientific and romantic sides of the subject in question, and shows the value of a scientific education upon the farm; also that success may come through apparent failure, and that a woman is a help to a man in the achievement of success. Our readers will be instructed as well as entertained, as the agreeable and impressive manner which is employed to convey the thought of the writer cannot fail to be appreciated.

A SUMMER VACATION.

(Continued from page 238.)

"I waited all the next morning, expecting the captain would call. But, doctor,," she added, "I cannot dwell upon this part of the story. Let me tell the dreadful truth at once. He did not come. So far from fulfilling his arrangement with me, he ascertained by some means about how much money was then standing in my name at the bank. How he found this out no one knows; but he must have done so, for the check he presented was within a small amount of the sum total standing to my credit."

"The infamous scoundrel!" I ejaculated.

"I was indeed bitterly punished for my foolish and romantic trust."

"And the amount of which he despoiled you—how much was that?" I asked.

"Twenty-nine thousand five hundred pounds!" she answered, slowly and steadily.

"Good heavens!" I cried, for the magnitude of the sum almost took my breath away.

"But surely," I continued, "he was not able to escape with so large a sum?"

"Alas! he was, and principally through my own weakness, for when I discovered what had happened I was for a time terrified and afraid to speak. But at length the confession of my folly was wrung from me. It was too late to overtake him then. He had left the country, leaving no trace behind him."

"And, of course, without paying his debts?"

"He never paid one of them."

"The arrant knave!"

"Worse still remains behind, for I might have lost myself as well as my fortune, I tremble when I think what would have become of me had he made me his wife! When I think of that I feel indeed that I have escaped cheaply——"

"No—no, Miss Linwood, pardon me," I interrupted—"not cheaply!"

"Yes," she said, slowly, "and when you have heard all you will agree with me. That letter which distresses me so much, contained the intelligence that it had been ascertained that at the very time Captain Chesney was urging his suit to me he was already a married man?"

"It seems impossible," I said, "that any one could contemplate doing you such a fiendish wrong! Such villany—such heartlessness—seems almost beyond belief!"

"I have forgiven him," she said, with great earnestness.

"Forgiven him?"

"Yes. And now let his name never pass our lips again. Where he is I know not. I have told you that there is some portion of my large fortune left—not much, but still sufficient for my wants. I feel that I shall never be able to trust any one again—never—never. You understand now why it is that under an assumed name I have come to hide myself at Melcombe Cottage. It was not that I was unable to bear my loss of fortune, I was resigned to that; but what tried me beyond endurance was the condolence of my friends. Their pity or their blame were alike maddening to me!"

"And so," I gasped, for I was so much touched by what I had heard that I had hardly any command over my voice, "and so, my poor girl, you have, like some stricken deer, sought out a place where you can bear your sorrow in secret and unknown."

A sob broke from her lips; she leaned more heavily upon me, her head rested against my shoulder. Scarcely less agitated than herself, I supported her trembling figure.

The impulse was strong upon me to throw my arms around her—to gather her to my breast—to pour out my love and consolation. But with an almost superhuman effort I controlled this impulse; luckily I remembered in time who and what she was, and that I was only a struggling medical man.

* * * * * * *

Two days later I was back in my dingy lodging near Victoria Park, feeling sad and weary, but looking forward with some eagerness to the morrow, for I was not without the hope that, by devoting my energies wholly to my profession, I should be able by degrees to efface the impression which Miss Linwood had made upon my heart.

When I left her she was calm and perfectly self-possessed. Having confided to me her reasons for adopting her present life seemed to have had the effect of soothing her spirits wonderfully.

Before leaving, however, I had given Mrs. Chamberlain some very special instructions about her guest. I knew I should be quite satisfied to confide her to the good woman's motherly care. She would watch her closely, and in case of any necessity arising was to write to me at once.

A month passed—a long, dreary time it seemed, although I scarcely allowed myself an unoccupied moment, and had induced my friend Holroyd to remain with me. At the end of this period a letter came from Melcombe Cottage.

It ran thus:—

"My dear Boy,

"This comes to say I am no ways pleased along of Miss Linwood condition. The Whether is very whet which keeps her indoors most of the time and she do nothing but sit Moping all day My dear Boy I think you better come and see her She is that thin it make my heart ake to look att her and she wont Eat nor Drink next to nothing and I fear she getting in a very bad way So I think you ought come at Wunst So no more at present from your Old nurse.

"Martha."

Poor old nurse! the production of this epistle had doubtless been a serious business with her. But it effected its object. I stopped only to give a few directions, and commenced my journey without delay.

It was getting late in the afternoon when I alighted at the station. The rain was falling in a steady downpour, and the town had a truly dismal look.

How my heart throbbed when, a few minutes afterwards, I opened the little iron gate in front of Melcombe Cottage, and walked quickly up the garden path!

The door opened before I could reach the threshold. Nurse had evidently been expecting my arrival.

She answered my eager inquires with a shake of the head, and then led me into the little sitting-room.

Miss Linwood was half sitting, half lying on the sofa near the fire; for though it was summer still, the afternoon was chilly.

At my entrance she sprung up, and held out her hand. What a poor, wasted hand it was, I thought, as my own fingers closed over it.

A flush of color dyed her cheeks for a moment, then faded away, leaving her pale as marble. It was then I noticed how large and wistful her eyes looked, and saw the dark shadow under them.

"This must be quite a sudden surprise," I said speaking with assumed cheerfulness, for I was fearful of betraying my anxiety; "but I had a chance to get away for a couple of days, and so determined to run down and see you. I am afraid I let you out of the doctor's care a little sooner than I ought."

"Indeed," she answered, flushing again, "there is really nothing the matter with me. I am very foolish and low-spirited—nothing more. I must try to shake off this depression,"

"Quite true," I said, very gravely, "you must. But do you know I fear you will not succeed while living here in such seclusion. It is a mistake to shut yourself out from life in this manner, depend upon it.

She smiled wearily.

"I am content," she said. "and have no desire to mingle in the world again. I am wretched, merely because I seem no longer to have anything to live for."

"Then pardon me, Miss Lockwood," I said, "you cannot be content Nor is it right that you should think there is nothing to live for. You have had a heavy blow, it is true; but still you must not sacrifice your life because a villain robbed you of your wealth. You think, no doubt, that your sorrow is a hard one to bear; but you should see some of the scenes which I am forced to look on from day to day. Your tender heart would be touched then, and you would esteem yourself fortunate that you were able to alleviate some of their distress. Your feeling is that you can never again be happy; but tell me, do you think you would experience much joy if you found you had the power to make others happy?"

"I should indeed," she said, with more animation than she had yet displayed.

"Then, Miss Linwood, listen to me. Let me prescribe something that will not only benefit yourself but many others. Make up your mind to leave. You tell me that some portion of your fortune remains. I will show you how you can make a noble use of it—how you can do good to others. And believe me, in these attempts to mitigate the misery of the thousands around you, you will find the speediest and most effectual remedy for your own distress. For a sympathetic, generous-hearted woman, there is a glorious occupation—a noble work to do"

"Doctor" she said, "I am grateful to you for showing me my duty. I have been wrong to sit here nursing my own grief. Show me the best way to begin this new life—let me commence without delay."

I had read her character truly—I had touched the right chord.

* * * * * * *

The result justified my expectation—the experiment succeeded perfectly. Miss Linwood—accompanied by the old nurse, who firmly refused to be left behind—as soon as the necessary arrangements could be completed, took up her residence in a pleasant house in the vicinity of my home.

I have mentioned that my practice was extensive but not lucrative. I had a very large number of patients indeed, but they were with few exceptions persons in a very humble station. I was parish doctor also, and in this capacity was brought face to face with poverty in its most terrible aspects.

It was a new experience for Miss Linwood. Brought up in affluence from her very birth, and for the most part having but to express a wish in order to ensure its gratification, she had never been able to realize what it was for people to be destitute of such necessaries of existence as fire, food, and clothes.

Few had better opportunities than myself, of knowing where monetary help was most needed-and I had but to mention the matter, for Miss Linwood to be ready with relief. At first, indeed, her excess of liberality was even productive of injury instead of benefit. This, however, was soon rectified, and she began, for probably the first time in her life, to have a clear idea of the value of money.

Her health improved rapidly and wonderfully. Her eyes grew brighter, her cheeks rounder, and her wasted figure by degrees assumed its proper contour. And at the same time all traces of regret and melancholy vanished from her face. She at last was happy.

I, too, was happy—that is, as happy as I could expect to be. Despite its utter hopelessness, my love for Miss Linwood continued undiminished. I saw her frequently—was often near to her, and so found content.

More than once my heart beat wildly, and my pulses throbbed as I fancied I perceived some sign that she had begun to regard me with a warmer regard. But my joy was always dashed by the remembrance of her own words, spoken so earnestly and firmly:

"I can never trust another—never—never!"

* * * * * * * *

Winter came and went; the sweet, soft spring-tide followed; but still the good work went on. Every day were blessings invoked for the "Good Angel," for so Miss Linwood was known among the poor, and fervent wishes for her happiness went up from many a heart.

One evening in May I was walking beside her in the direction of her residence. The subject of our conversation was—as was frequently the case—the past.

"How much I am indebted to you, doctor," she said, with grateful tenderness. "Think what I owe you——"

"Pray do not," I said; "I do not deserve your thanks. If you knew——"

"Dr. Broughton," she said, "do you remember all I told you about that unhappy episode in my life?"

"Every word."

"Something I said then I wish to retract—the words were uttered thoughtlessly and in haste. You had not taught me better then. I told you I could never trust another person. I am conscious now how wrong I was, for need I say, dear friend—I could trust you—absolutely—perfectly!"

There was something in her voice and manner which affected me strongly. Without stopping to think—forgetting all my stern resolutions—scarcely knowing, indeed, what I said, I made a declaration of my love!

Never once did she attempt to interrupt me by voice or gesture. Encouraged by her silence, I asked the question upon which my happiness depended.

For one instant her eyes met my own—only for an instant. But it was enough. I read my answer in that one glance!

"Arthur," she said, very softly, "you have brought me from sorrow to content, and now you have made me the happiest woman in all the world!"

* * * * * * * *

We were married on the anniversary of our first meeting. How happy I was—how happy we both were—and yet before the honeymoon was over I told my wife that she was a tyrant and a deceiver

This was the cause:

In the first place I had always made up my mind to a life of absolute independence.

My wife ruled otherwise; she insisted that I should make my friend a free gift of my practice and all the money then due to me by my patients, as shown by my ledger and day-book, and that instead of occupying myself any more with drugs and surgery, that I should accompany her upon an extensive Continental tour, as she had set her heart upon visiting all places of interest in Europe.

It was in vain I argued, and pleaded, and reasoned. Like many another husband before me, I had to submit, and allow my better half to have her own way.

That was the tyranny.

Then she had told me that her false lover had drawn out nearly all the money in the bank—as I understood her, nearly all her fortune; but this I found was not so. Her lawyer had not sold the whole of the various shares, and I discovered that, instead of the modest competence I expected, my wife possessed a fortune of nearly £80,000.

But this deception I have consented to overlook, and as soon as we are weary of sight-seeing and wandering, we shall settle down in a quiet country home.

So far we have never heard a word of Captain Chesney and what he did with his ill-gotten gains promises to remain a mystery. Edward.

A Love Letter.—A fair damsel of the West, according to the Litchfield (Ill.) Democrat, recently sent this note to her faithful knight:

Deer Will—Doant kum to see me eny more for a whial eny way. Fauther has got awfully skeered about burglars, and he sits up every nite till late with a double-barrelled shot-gun watching the back yard. He put moren a pound of lead into Brown's Newfoundland dog which was cummin over the fens after a boue last nite.

The rose is red, the voilet blew,
I wouldn't kum now if I was you.

A young lady sent a poem entitled, "I Cannot Make Him Smile" to a British newspaper. The editor ventures to express the opinion that she would have succeeded had she shown him the poem.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

IODINE IN GOITRE.

T. H. H., M. D.

MRS. M'LOUTH warns the readers of the RURAL against the use of iodine for this disease. I think she is mistaken in attributing death to the use of this remedy unless it was very carelessly used, and I know it will cure the disease. The writer is a physician, though long retired from practice. Seven years ago he noticed a slight enlargement of the thyroid gland in his own neck. In two years it had grown considerably and was evidently goitre. Supervening upon a severe cold the enlargement became much accelerated, the neck soon reaching 22 inches in size, and the pressure upon the larynx (windpipe) being so great as to interfere with free respiration in the recumbent posture. So far no remedial means had been employed, and although iodine is the standard remedy of the books, a study of reported cases treated with it did not give a very encouraging percentage of cures. So I went to Boston and consulted the leading members of the faculty there. One surgeon had practiced extirpation of the tumor with the knife, but the patient died. The electricians were consulted, but Dr. Garratt, who is the most eminent among them, thought that no curative results could be expected in less than a year of daily applications of the current, and could report no cures. Discouraged by this, I resolved to give iodine a thorough trial. I took five drops of Lugol's solution at a dose two or three times a day, in a cup of chocolate. In two months the size of the neck began to decrease, and in six months the enlargement had entirely disappeared. Other cases subsequently treated in the same way, ended in an equally satisfactory manner.

I think that the failure of the iodine treatment, where it does fail, is, most likely, due to discontinuing the medicine too soon, either because of the irritation of the stomach by too large doses, or by discouragement on account of the slow development of its curative action. The dose should never be large enough to cause a persistent iodine taste in the mouth, or even the taste of the medicine in gas from the stomach. When but four or five drops are taken in a cup of chocolate, it is not tasted at all. No unpleasant symptoms, or indeed any effects, except the disappearance of the disease, were experienced during the whole treatment, either in my own or the other cases.

There is another matter alluded to by Mrs. M'Louth which I think is misunderstood. Boils or other swellings do not necessarily indicate impurity of the blood. Boils frequently appear upon people who bathe too often, as boys are apt to do, and as lumbermen and others who work in water, are obliged to do. "Packing" in a wet sheet, as practiced in the hydropathic treatment, will always produce them. The skin of man is not adapted to amphibious life, and constant or very frequent irrigation of it, is a powerful irritant, developing inflammation in its glandular structures. Many other "swellings" must be regarded as the results of local irritation, and do not imply any constitutional taint or defect of the blood. Emollient applications to such swellings, when they cause them to disappear, do not "scatter them," or "send the poison all over the system." They simply *cure them*, as the removal of a splinter from the flesh, or an ulcerated tooth from the jaw, cures,—that is, by putting an end to the cause.

Orleans Co., Vt.

MILK AND BUTTER.

WHAT a splendid thing a *new* tin can is for preserving an equal temperature on all sides, when warming cream in front of a hot fire. In a stone jar the cream will cook quite readily upon one side while the other is cold. When the cream gets a little warm, or is not exactly cold, put it into the churn, have it churned *moderately* fast and when the butter stands in insolated lumps upon the dishes and lid, scarpe it down with the finger, put in the yellow of an egg and after churning a little longer, gather, work and salt it, pressing out all milk and water. Make into cakes of a pound each and print it. This is gilt-edge winter butter. Have a solution of saltpeter, dip the print in it after dipping it in the hot water, and wet a rag in the remainder of it for spreading over the butter. M. L. S.

FOOD FOR INFANTS.

A SOUTHERN lady, mother of a large family, favors mothers nursing babes until they are two years old, but she also advises feeding them after they are six months old. She says: "Give them soft, boiled rice, light bread, crackers or barley with a little milk. Also give a piece of rare steak to suck upon. *Do not feed corn-starch and never sweeten an infant's food.*"

Fruit Jars, Again.

I was pleased to see Mrs. Wager-Fisher's remarks concerning fruit jars, and if the truth were known, undoubtedly many others entertain the same opinion; and if they would "speak out," we should not be compelled to buy the Mason simply because no others are kept for sale. Their being so difficult to open, is another objection with me, as John's strong hands are not always here when I have occasion to open them. I have used the rubbers for several years, by soaking them in cold water for a day or two before using. The can I prefer above all others is stamped Grifien's Patent, and is similar to that described by Mrs. Wager-Fisher. The glass cover rests on the jar with a rubber between, and is held down by an iron clamp. Two bulges near the top of the jar keep the clamp in place. It is very plain and simple and cannot fail to please. That it should be called "Perfection" is the verdict of those who have used it.

I do not agree with Mrs. A. B. that it does not pay to can our own tomatoes. Many families in the West consume from ten to fifty gallons of them during the winter, and the expense is no small item, when one has to buy them; but, of course, it does not pay if they are spoiled in the least or soured. If there is any mold or scum, or if the fruit is discolored, you may be sure there is some flaw or crack in the jar—that is, if the fruit was boiling-hot when sealed—in which case I paste paper on the jar while hot after the fruit is put in. I find that empty oyster cans are excellent for tomatoes. Open them by putting live coals on the cover, and in sealing, use brown sealing-wax from the store, as it does not "run" like that of home manufacture. I have succeeded quite as well with stone jars or jugs and often use a pane of glass for the cover of one, two and three-gallon jars, and a smaller piece for the jugs. Canned fruit should be kept in a dark, cool place. JULIA A. WHEELOCK.

DOMESTIC RECIPES.

Brown Bread.

ONE pint of sour milk, one-half cup of molasses, two cups of rye flour, a little salt and a teaspoonful of soda. Steam three hours and then brown in oven.

Ginger-bread.

One cup of molasses, one-half cup of butter, one-half cup of boiling water, tablespoonful of ginger, a teaspoonful of soda and flour sufficient to roll out. SUBSCRIBER.

Nice Apple Sauce.

Pare, halve and quarter tart apples and put into a baking dish. Cover with a thick layer of white sugar, grate over a little nutmeg and cover with a plate. Set into a pan containing hot water and bake in a good oven until the pieces are clear and tender.

Spinach.

Look over carefully, pick the leaves from the stem, wash, cook 20 minutes in salted water, drain, chop fine, return to the fire, season with butter, pepper and salt, press into a hot mold or bowl, turn out and garnish with sliced egg.

Salmon Croquettes.

One can of preserved salmon—drain off the liquor; yelks of two eggs; one raw egg; one-half cup bread crumbs; tablespoonful of butter; pepper and salt. Mince the fish, add the powdered yelks, the raw egg, the butter, then the crumbs and seasoning. Form into egg-like cakes, roll in flour and fry in sweet lard, or lard and butter. MARY B.

Wardian Case Cement.

After experimenting with several different cements for Wardian Cases, I find that the following will stick to stone, glass, metal or wood, and that it will harden under water. Take equal parts, by measure, of litharge, plaster-of-Paris and dry, white sand; then add of powdered resin a third as much as taken of any one ingredient. Make into a putty with boiled linseed oil, adding a little patent dryer. Mix only as wanted, The dry ingredients should be kept tightly corked. This can be used for marine as well as fresh-water aquariums.

H. L. PRINE.

Tomatoes in Glass or Tin?

My experience is that tomatoes will keep good in tin and spoil in glass. I have used Mason's cans until the lids were worn in holes, from age, and do not know of any stretching, although the rubbers stretch and must be renewed. After screwing down the tops, I immediately reverse the jar which saves many a can of fruit from imperfect sealing. When wanted for use, run a *thin* knife blade around under the rubber and they can easily be opened by hand. E. M. W.

QUESTIONS ANSWERED.

Preserving Strawberries. Icing Cake.

Please give a recipe for canning and preserving strawberries; also directions for icing and embossing cake. L. G.

Ans.—*To Can Strawberries:* Fill glass cans with fresh, whole strawberries sprinkled with sugar, in the proportion of one-half pound of sugar to a quart of fruit. Put on the tops and place in a boiler of cold water—the water should be within two inches of the top of the cans. When the water boils, note the time and boil 20 minutes. Take out; make air-tight; screwing down again and again as the cans cool.

To Preserve Strawberries: Five pounds of sugar and a pint of water to seven pounds of fruit. Put sugar and water into a porcelain kettle and boil from seven to ten minutes, according to thickness. Then add the fruit, previously washed and drained, and boil four minutes. Skim out the fruit, turn the sirup into clean tin pans, and place in the sun adding the berries as soon as the sirup is cool. Let stand in the sun—protecting from insects—the sunny part of two days. Then put into glass and screw down. It is not necessary to have the cans air-tight.

Icing Cake: A good rule for frosting is ten large teaspoonsful of powdered sugar to each white of an egg, but as eggs vary the measurement must also vary. The whites should be beaten to a stiff froth, and the powdered sugar added gradually, beating the meanwhile, flavor and put on while the cake is still warm. Smooth off with a knife and if the frosting is stiff, dip the knife frequently into cold water. The cake may be ornamented by drawing a small syringe full of icing and then making wheels, Grecian border, flowers or beading. Ice the cake plain and let harden before ornamenting.

New Publications.

NEW MUSIC BOOKS.

COMMON PRAISE HYMNAL. (30 cts. flexible covers), by J. H. WATERBURY, is a wonderfully good, compact and cheap collection of 150 standard hymn tunes, 170 standard hymns and numerous chants. Examine for Sunday School or Congregation.

NEW FLOWER QUEEN. (75 cts.) by G. F. ROOT. Just revised and improved by the author, and is a fine cantata for May and Flower Time.

EMERSONS ANTHEM BOOK. $1.25. By L. O. EMERSON. A very superior Anthem Book.

WHITE ROBES. (30 cts.) Best Sunday-school Song Book.

ROBINSONADE. (50 cts.) Good Music, a poem to recite, tableaux, and amusing action, founded upon the adventures of "Poor Robinson Crusoe." By A. DARR.

Temperance Jewels. (35 cts.) Best Temperance Book.

FIELD OF HONOR. Or Pre aux Clercs. ($2.00.) By HEROLD A famous Opera. Just published.

THE SORCERER. ($1.00.) SULLIVAN'S Best Opera.

Any book mailed for retail price.

News of the Week.

MISCELLANEOUS.

Monday, April 12, 1880.

The tunnel under the Hudson River, between Hoboken and New York, is now making a progress of thirty feet a day.....The Herald relief fund for the Irish people has swelled to the sum of some $330,000.....A hotel-keeper in New Orleans was shot and instantly killed on the 9th inst. in a quarrel over ten cents .....A six days' walking match for the championship of the O'Leary belt was last Saturday completed at the Madison Square Gardens, New York. The belt was won by a young colored man named Hart, who in the six days walked 565 miles. This beats anything on record. He will get $17,500 for his week's work.... ....A man named George Marks who died last week at Lancaster, Pa., confessed on his death-bed that he and another man named Wielder, in 1855, murdered a traveling salesman, took his money and cast the body into Conestoga Creek.....A recent telegram from Santa Fe, New Mexico, states that General Hatch, with part of his command, attacked 300 Apache Indians who were encamped in the San Andres Mountains. The Indians retreated after a fight of six hours, leaving their dead behind.....A project has been made for the construction of a new Welland Canal across the Niagara peninsula from Port Dalhouse on Lake Ontario to Port Calborne on Lake Erie. The water-way descends 326 feet and it will necessitate the construction of great reservoirs and locks..... A quarrel at a country dance in Callaway county, Mo., last Friday night, resulted in the killing of Lewis M. Meyers by Bartholomew Watson..... The heaters in the Allentown, Pa., Rolling Mill, have struck for an increase of wages and work has been stopped in all the departments of the mill. .....Destructive fires occurred during the week at Wilmington, N. C.; loss $25,000, one man was killed and several severely injured; at Haverhill, Mass., where a tenement block was burned, two persons suffocated and others injured; at New Brunswick, N. J., where the N. J. Rubber Company's factory was destroyed; loss, $10,000; at Portsmouth, N. H., where a Congregational church and an adjoining house was burned; at Milwaukee, Wis., where a large store occupied by Stamford & Logan was destroyed. Further, a dispatch from Petroleum Center, near Titusville, Pa., says that on last Saturday a conflagration destroyed fifteen buildings in that place. The fire originated in McClintock's Hotel.

AGRICULTURAL NEWS.

Monday, April 12, 1880.

AMERICAN consuls are now required to send to Washington monthly reports of the commercial, industrial and agricultural conditions at their respective ports. Now let the public be informed of the nature of the news so as to be able to utilize the information.... ...The Adams Co., Ill. Agricultural Society, offers premiums of $5, $3, $2.50, $2, $1.50, and $1, for the largest surrender of rat tails up to August 30 ... In 1870 the receipts of wheat in St. Louis were 6,638 253 bushels, and the shipments 636,562 bushels; last year the former had run up to 17,093,362, and the latter to 7,302,076 bushels .....A dangerous and infectious disease, caused by a minute fungus, has broken out among bees in Italy. . . Gen. Brisbin says no Hickory grows west of the Missouri River..... New Jersey has established an agricultural experiment Station at New Brunswick, Professor Cook, the State Geologist, Director.

Gilt-Edge Butter Maker

makes July, August and Winter butter equal to best June product. Grocers pay three to five cents a pound extra for butter made with this powder. Guaranteed harmless. Increases production six to ten per cent. Reduces time of churning one-half. Sold by druggists, grocers and general storekeepers. Send stamp for "Hints to Butter-Makers." Address, Butter Improvement Co., Buffalo, N. Y.

THE larger the profits machinery of any sort puts into the pockets of the owner, the more desirable is its possession. On this principle the J. C. Chase Thrashing Machine Co., of Racine, Wis., should find no difficulty in disposing of all the machines they could make, among thrashermen. Their Apron Eclipse and Vibrator Thrashers have earned an enviable reputation wherever they have been used--and in what part of the Great West have they not? Excellent workmanship and materials and great efficiency are the characteristics of all the work they turn out, whether thrashers or portable and traction engines, etc.

A COUGH, COLD, CATARRH OR SORE THROAT should not be neglected. "*Brown's Bronchial Troches*" are a simple remedy, and will generally give immediate relief. Imitations are offered for sale; many of which are injurious. The genuine "*Brown's Bronchial Troches* are sold *only in boxes.*

A timely use of Hop Bitters will keep a whole family in robust health a year with but little cost.

The superiority of BURNETT'S FLAVORING EXTRACTS consists in their perfect purity and great strength.

The Markets.

SPECIALS FROM ALL CENTERS.

Until Saturday, April 10.

MAPES'S complete manures for clay soil, $25.50 per 1,000 lbs.; for light soils $25.50 per 1,000 lbs.; "A" brand for general use, $20 per 1,000 lbs.; fruit and vine, $18.50 per 1,000 lbs.; cabbage and cauliflower, $23.75 per 1,000 lbs.; corn, $24.50 per 1,000 lbs.; potato, $24 per 1,000 lbs.: asparagus, $25.50 per 1,000 lbs.; gypsum, Nova Scotia, ground, ₩ ton, $7.50.

BOWKER'S "Hill and Drill Phosphate" $45; Bowker's Phosphate $40 ₩ ton, each: Bowker's "Food for Flowers," 35c. ₩ package and $3 ₩ doz.; Bowker's "animal meal for fowls," $2 50 per cwt.; Ground oyster shells, $1 ₩ cwt.

BAUGH & SONS' prices for goods delivered at depot or boat, in bags and in 2,000 lb. lots: Ammoniated dissolved bones, $35; pure bone meal, from raw bones, $36; Baugh's raw bone superphosphate $40; Baugh's $25 phosphate, $25; Baugh's A. A. nitrogen, 13½ per cent. of ammonia, $48.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, April 10, 1880.

BEANS AND PEAS.—About the only life given the bean trade is now derived from exporters. In this way marrows and white kidneys are fairly firm. Mediums sell mostly to a class of buyers who can use cheap goods. Red kidneys dull and tending lower. Wis. green peas, quiet at $1,80. Southern B. E. per bu. bag $1.90@2; with a better sale. Marrow beans, prime, $1.52½@1.55; other, $1 40@1.47½; medium prime, $1.35@1.40; other, $1,25@1.30; pea, $1.45@1.62½; white kidney, $1.55@1.70; red do., $1.27@1.50; black $1.95@2. California Lima, $5

Receipts of beans for week, 2,650 bush.; exports, 1,020 pkgs.

BUTTER—There has been quite a sweeping reduction in prices for new during the week and the market is likely to be flexible and in buyers favor, while new white is the dependence. Creamery has not much precedence over tubs or dairy stock. Old butter is no longer a quotable item; the remnants are held for special shipment. New arrives freely but in very small lots, and to make up a fair sized line of pretty even quality buyers have to sample a great many parcels. This feature alone tends to disarrange prices, as it would be hard to make duplicate rates rule in too many small transactions. Western butter is scarce, but follows the decline in State.

New butter, creamery choice, 28@30c.; poor to good, 24@27c.; State, pails and hf. tubs, best, 25@27c.; other, 20@24c.; imitation Western creamery, 23@26c.; do. extra, 23@24c.; other, 17@22c.; do. factory extra, 23@24c.; other 17@22c.; other, very poor western, 11@31c.

Receipts for week, 11,600 pkgs.; exports, 2,500 do.

BEESWAX.—Demand is limited to small lots, with 24@25c. quoted for Western and Southern.

Exports for week, 1,300

BROOM CORN—Trade is slack and prices unsettled; quotations are for choice brush at 7½@8c.; choice hurl at 8c.; stalk braid at 6@7c.; mixed red and green at 4@5c.

CHEESE.—Exports for the week, 9,400 boxes. The demand is sufficient: the small stock considered to give steady prices, and the situation is essentially as last week.

Prices are for State factory: best at 14¼@14½c.; good to prime at 13¾@13¾c.; fair to good at 13¼@13½c.; do. poor at 11@12¾c. State farm dairy: good to prime at 13½@14c.; fair to good at 13@13½c.; poor, 11@12c.; Ohio factory: Cheddar, fine, 14c.; do., fair to good, 12¾@13¾c.; flat, fine, 14@14¼ flat, good to prime, 13@13¾c.; flat, fair to good, 12¼@13c.

Receipts for week, 5,525 boxes.

Exports, 8,300 do.

Liverpool cable, 71s.

Freights, 35s.

COTTON—There has been a sharp pressure to sell and prices have dropped sharply, closing weak at for April, 12.15@12.17c.; May, 12.21@12.23c.; June, 12.35@12.36c.; July, 12.45@12.46c.; August, 12.52@12.54c.; September, 12.22@12.24c.; October, 11.58@11.60c.; November, 11.26@11.28c.; December, 11,24@11.26c.

DRIED FRUITS.—Apples are in good demand and prices strong. Peaches are quiet as also small fruits. N.C. apples, fair to good, 7½@8½c.; choice, at 9@10c.; fancy at 10@10½c; Virginia, at 7@8c.; New York State quarters sliced at 7½@8¼c.; patent evaporated, choice in cases, at 14½@15c.; good and prime at 13½@14c.; evaporated, choice sliced at 13@13½c., and good do. at 12@12½c. Evaporated peeled peaches, good to choice, at 27@28c.; North Carolina peeled, fancy, at 26c.; choice old at 17@18c.; Georgia prime at 16@17c.; fair to good at 14@15c.; common at 10@12c.; unpeeled halves at 7½@8c.; do. quarters at 7@7½c. Pitted cherries at 18@19c. Blackberries nominal at 11c. Raspberries at 27@28c. Plums at 17@18c.

Exports for week, 1,291 bbls. apples.

EGGS.—Receipts for the week, 10,740 bbls.; do. last week 17,380 do. The tone of the market is decidedly more wholesome. Sales are not so sharp at the new prices, but the falling off in receipts strengthen sellers. Canadian are exported as the market improves.

Near Points, 14½@15c.; State and Penn., 13c.; Western, choice fresh, 12½@13c.; Southern, do., 12@12½c.; off grades, such as badly packed or extra stale, 11@11½c.; duck, 19@20c.; goose, 30@32c.

FRESH FRUITS.—Exports of apples for week, 3,650 bbls. The market is firm for sound and extra apples, but it is doubtful if such high prices as may be realized as the supply goes out, will repair losses during the past mild winter.

Extra Baldwins and Greenings $4.50@5; other $2.50@3.25; russets $2.75@3. Cranberries $3 75@4.25 ₩ crate. Strawberries run poor in quality, many moldy price weak. Chas. 12@28c.; Fla. 18@30c. Fla. oranges are now in few hands: choice quarter $6@7 ₩ half bbl. box; dry or rusty $3@4. Peanuts active, particularly for other points: Va. hand-picked 5½@6½c.; Eastern prime 5½@5½c.; good to prime 4½@5¼c.; shelled 5½@6c. Hickory nuts 75c.@$1. Pecans now mostly in retailers' hands.

FURS AND SKINS.—Reports from the Leipsic sale now in progress expected next week.

FLOUR.—Supplies have been larger, and wheat has been declining; a decidedly lower range of prices. Lates' prices are $3,85@4.75 for inferior to very choice superfine State and Western; $4.75@5.00 for inferior to very good extra do., odd lots and lines; $5.00@5.30 for very good to very choice do.; $4.75@5.00 for inferior to good shipping extra do., and $5.00@5.30 for good to very choice shipping extra do.; inferior to very good white wheat extras, $5.15@5.20 very good to very choice do. at $5.00@7.00 (fancy brands held at higher figures); red and amber winter wheat, inferior to fancy trade and family, at $5.00@6.75; round hoop Ohio, $4.85@5 25; and trade and family brands of do. at $5.55@6.75, the latter rate for very choice; St. Louis at $5.00@5.85 for inferior to very good extra; $5.85@7.00 for very good to very choice; Minnesota clear, inferior to very choice, at $4 75@6.25; Minnesota "straight," inferior to fancy, at $5.35@7.85, and patent inferior to fancy at $6.00@8.50; unsound stock at from $3.60@5.75; city mill extra at $5.90@6.25 for fair to fancy West Indies; do. for England, $4.85@5.50 for poor to very fancy; do. trade and family extras, $6.40@7.25; do. for South America, $6.20@6.65; No. 2 at $2.85@3.80 for poor to very choice.

CORN MEAL.—Sales at $3.20 for Brandywine, and $2.90@3.10 for yellow Western.

GRAIN.—All articles have been in large receipts and prices declining, closing, however, with some reaction on corn and oats, but wheat remaining weak. Exports for the week have been 1,004,000 bush. wheat, 1,033,000 bush. corn, and 62,000 bush. rye. Latest prices of wheat are for No. 1 white at $1.31@1.32; do., April, at $1.30¼@1.30¾; do., May, at $1.25½@1.20¾; No. 2 white at $1.22@1.22½; ungraded white at $1 30; No. 2 red, store and afloat $1.34@1.37; do., do. April option, at $1.33¾@1.35¾; do., May at $1.32½@1.33¾; do. June at $1.30½@1.32; ungraded red at 1.33½@$1.36; mixed winter, at $1.33; choice Green Bay at $1.30; No. 3 spring at $1.18@1.19 Rye quoted at 90@90½c. for State. Corn at for New York No. 2, at 52@53c.; old crop at 53@53½; do., April, at 51¾@52c.; do., May, at 47¾@48c.; do., June, at 47½c.; New York steamer mixed at 51½@51¾c.; ungraded mixed Western at 51½@53¾c.; No. 3 at 50¾; New York yellow at 54½c.; No. 2 white 57¾c.; No. 2 for May at 47¾c.; Oats at for No. 1 white quoted at 47¾@48½c.; No. 2 white at 46¾@46¾c.; No. 3 white at 44@44½c.; New York No. 1 at 41¾c.; New York No. 2 at 41½@41¾c.; do., May, at 38½@39c.; No. 3 at 40½c.; ungraded white Western at 44½@45c.; ungraded mixed Western at 39@42c.; white State at 48@50c.; mixed State at 40¾@42c.; No. 2 Chicago at 41¾c.; No. 2 for April at 40¾c.; No. 2, for May, at 38½c.

HAY AND STRAW.—Demand is good prices better. Shipping hay quoted at 70c.; retail lots at 75@80c.; for medium, and 85@$1, for prime; clover at 55@60. Straw at $1@1.05 for long rye; 65@70c. for short rye, and 50@60c. for oat.

Exports for week, 2,250 bales.

MAPLE SUGAR.—The demand is better than for several back seasons. Shippers seem to have become tired of New York's uncertain market and are apparently giving sugar a wider distribution. Another cause for the light supply here is through holding sap or sirup for winter use, as fine pure sirup has become very popular at restaurants. Molds quoted at 11¾@13¾c.; sirup, in tin, 75c.@$1 per gal.

OIL CAKE—Western is quoted $30 ₩ ton.

PROVISIONS.—Hog products have been active and lower: Mess pork quoted at $11.00@11.05, for May and June; $11.10@11.15 for June. Bacon at $6¾ for long clear. Beef at, for extra India mess at $28@2 0 for city and $19 for Philadelphia and at $11 for extra mess and $10 for plain mess; beef hams at $17@17.50. Lard—Western steam at 7.42½ for spot, 7.40 for April; 7.42½ for May, and 7.45@7.47½ for June.

Stearine at 7¼c. for Western. Tallow at 6.1-16@6¼ for prime.

Receipts for week, pork, 1,900 bbls.; beef, 600 pkgs.; bacon and cut-meat, 28,300 pkgs.; lard 18,750 pkgs. Exports, pork, 6,078 bbls.; beef, 2,780 pkgs.; bacon and cut-meats, 11,770,350 lbs.; lard, 7,620,825 lbs.

POULTRY AND GAME—The demand is light for dressed poultry, with spring items of food drawing off a portion of the trade. Prime frozen, as before, sells best. Large turkeys or coarse fowls not wanted. Capons have advanced.

Turkeys, choice, small, 14@16c.; medium, 12@14c.; large, 10@12c.; Phila., dry-picked, 14@15c.; capons, Phila. large, 24@25c.; small, 21@22c.; slips, 18@20c.; chickens, winter, large, Phila., 22@24c.; small, 25@26c.; spring, per lb., @35@40c.; fall, Phila., d.-p., 18@20c.; yearling, Phila., d.-p., 14@15c.; N. J., ℔ lb., 12@14c.; fowls, Phila., d.-p., 10@11c.; N. J. good to prime, 11@12c.; State good to prime, 11@12c.; Western, good to prime, 10@11½c.; poor to fair 9@10c. Ducks, Phila, d.-p., 18@19c.; N. J., 10@12c.; State, 15@17c.; Western, 14@16c.; Western, poor, 10@12c.; squabs, white, ℔ doz., $3@3.25; dark, $1@2.

Live poultry is not plenty and are firmer: heavy supplies, however, are not advised. Spring chicks now quoted regularly.

Chickens, spring, large, per pair, 75@90c.; small, 40@60c.; fowls, N. J., 10@11c.; Western, 10c.; roosters, 5c.; turkeys, mixed, 11@12c.; ducks, Jersey, N. Y. & Pa., per pair, 75c.@$1; Western, 60@75c.; geese, Jersey, $1.75@2; N. Y. & Pa., $1.50@1.75; Western, mixed, $1.12@1.37; pigeons, 35@45c.

Wild pigeons plenty and lower. Wild ducks almost nominal.

English snipe, per doz., $1.25@1.37; plover, $1.25@1.37; wild pigeons Northern $1.25℔ doz; do., Southern, $1.25; canvas back ducks, Havre de Grace, $1.50@1.75, Western, 75c.@$1; Norfolk, $1@1.50; redhead, Havre de Grace, 50@75c.; do., Western, 45@50c.; do., Norfolk, 40@50c.; Mallard, Western, 40@50c.; Mallard & Black, 30@40c.; Teal, Western, 20@30c.; do., Norfolk, 25@30c.; common, 20@25c.

HOPS.—Trade continues slack and prices barely steady. Quotations are:

	Cents per lb.
New York, fancy	Nomial.
New York, new crop, good and choice	33 @36
New York, new crop, medium	31 @33
New York, new crop, low to fair	27 @29
Eastern, new crop	27 @35
Wisconsin, new crop	27 @35
Yearlings	7 @18
Olds, all growths	4 @10
Pacific Coast, new	30 @35
Pacific Coast olds (nominal)	5 @10

SEED.—Clover is stronger; sales at 6¼@7c. for Western. Timothy is quiet at $2.70@2.80.

VEGETABLES.—Exports for week, 750 bbls. Potatoes have in no way recovered from their late dull, sluggish position and sales are still mainly at the inside rates. Snowflake may be in a degree excepted, as there is some seed demand as a trial.

Bermuda, new ℔ bbl., $6.50@7; Florida, new, ℔ bbl., $5.50@6; prime other, $2@3; Early Rose, N. S., bulk, ℔ bbl., $1.25@1.37; Maine, per d.-h. bbl., $1.75@1.87; State, ℔ d.-h. bbl., $1.25@1.50; State, in bulk ℔ bbl., $1.25@1.50; prolific N. S., per d.-h.bbl., $1.25@1.37; N. S., in bulk ℔ bbl. $1.25@1.37; Mercer, Nova Scotia, bulk, per bbl., $1@1.12; Chili red, N. S., bulk, ℔ bbl., $1@1.12; Peachblow, State, white, per d.-h.bbl., $1.50@1.75; do., red, per d.-h. bbl., $1.50; Snowflake, State, per d.-h. bbl., $1.75@2; Peerless, State, ℔ d.-h. bbl., $1.00@1.25; State, bulk, ℔ bbl., $1@1.12; Jersey, bulk, ℔ bbl., 50@75c.; Sweet potatoes, ℔ bbl. $2.25@3.00. Old garden stuff is quite pushed aside for the new items in the list, and the market for the latter is sharper. Tomatoes, Fla., ℔ box, 50c.@$1.00; Nassau, 50c.@$1; Bermuda, ℔ box, 70@90c.; beets, Bermuda, new, ℔ crate, $1.50; Fla., $1.50@1.75; cucumbers, Fla., $4@6; string beans, Florida, round, 2@$4.50; Fla., flat, $1.25@2; squash, Fla., white, $2@2.50; green peas, N. C., ½ bbl. crate, $1.50; Chas. and Sav., small, $1.75@2.25; asparagus, Norf., ℔ per doz. bchs. 35@37; Chas., $5@6; kale, Norf., ℔ bbl., 75c.@$1.75; Baltimore, per bag, $1; spinach, Norf., per bbl., $2.25@3.00; Baltimore, $1.00@2.50. radishes, Nfk round ℔ 100 bunches 50@75c.; long, 50c.@1; squash, marrow, per bbl., $1.50@1.75; Hubbard, $1.75; cabbage, Chin and Sav., $3@4.25; Fla., new, $4@4.50 do., old, per 100, 16@12; onions, Bermuda, new ℔ crate, $2.50; white, ℔ bbl., $4@6; yellow, $3.25@3.50, red, Eastern, $2.75@3.00; red, Chester, $2.75@3; beets, Jersey, $1.50@1.75; turnips, Russia, 75c.@$1; carrots, $1.25@1.75.

WOOL.—Demand has been less active this week, but prices well sustained.

Ohio, Pennsylvania and Virginia, XXX and picklock, 57@60c.; XX, 55@57c.; X, 55@56c.; No. 1, 62@65c.; No. 2, 55@58c.; common, 52@54c.; combing and delaine, 58@65c.

Michigan, Indiana and Wisconsin, X and XX, 52@55c.; No. 1, 59@62c.; No. 2 and common, 50@55c.; combing and delaine, 57@62c.

New York, New Hampshire and Vermont, X XX 49@52c.; No. 1, 55@60c.; No. 2 and common, 47@52c.; combing and delaine, 55@60c.

Iowa, Illinois and Western, X and XX, 48@51c.; No. 1, 54@58c.; No. 2 and common, 45@51c.; combing, 52@57c.

LIVE STOCK MARKETS

NEW YORK, Saturday, April 10, 1880.

BEEVES.—Receipts for week, 9,244 head; do. last week, 12,183 do. The market has had a buoyant run all the week, and closes clear of stock, with a good outlook for next week. Very few extra cattle were on sale, and good steers were benefitted thereby in the price range. Ordinary to fair steers, 8¼@9¼c., dr. 56 lbs.; good to prime, 9¼@10¼c., dr. 56@57 lbs.; rough oxen, 8¼@9c, dr. 56 lbs.

COWS AND CALVES.—There are no new features. Good cows worth more in the country than here, freight and dressing expenses considered.

VEAL CALVES.—Prime live are scarce at the moment and prices are temporarily firm. This is not the season for prices to rule high long. Live calves, N. J. and Bucks Co., choice, 7@7¼c.; prime 6¼@7c.; State, choice, 6@6¼c.; do. prime, 5¾@6c.; fair to good, 4¾@5¼c.; poor, 4@4¼c.; Mt. Holly, good to choice, 6@8c.; buttermilk, 3@4c.; grass, 2½@3c.

Hog Dressed, N. J., choice, 9¼@10c.; good to prime, 8@9c.; State, good to choice, 8@9c.; fair to good, 7@8c.; poor to fair, 4@7c.

SHEEP AND LAMBS.—Receipts for week, 17,768 head; do. last week, 22,960 do. There has been a good active market and no important lots remain unsold. Some car louds were held over purposely for special customers at the close of the week. Clipped sheep, 4¾@5c.; unclipped 6@7¼c.; a car load of extra Michigan, $7.35 per 100 lbs. Spring lamb, $4@5.50 per head. Sheep rate show an advance of ¼@¾c. compared with Thursday's sales.

SWINE.—Receipts for week, 30,207 head; do. last week, 31,018 do. Supplies were sold up; nominal rate for prime Ohio, 5¾c. full.

Country-dressed pork, light, 6¾@7¼c.; medium, 6¾@6¾c.; heavy, 6¾@6¾c.; city dressed, 6¾@6¾c. Pork tenderloins, 10c.

STOCKBRIDGE MANURES
For 1880.

Some years ago the Stockbridge Manures were only known to a few farmers in the Connecticut Valley. Now they are so extensively used in different parts of the country as to require two large factories, one in New York and one in Boston to manufacture them. This increase shows what farmers think of good fertilizers, and is not only due to the fact that they are reliable, well-made, and high-grade manures, but also to the fact that farmers have
FOUND THEM PROFITABLE TO USE.
Now that corn, and other farm produce is bringing such good prices, we anticipate that farmers will invest still more largely in our fertilizers.
Besides the Stockbridge Manures, we manufacture several high-grade Phosphates, and deal in first-class chemicals of all kinds. Farmers who intend to use Fertilizers of any kind, should

Reading for the Young.

AN XMAS ON LOPEZ ISLAND.

Santa Claus Among the Indians.

XMAS is gone, but having just read some of the interesting letters of the cousins, it has occurred to me, they might like to hear of Xmas among the Indians. We had a Christmas tree on Xmas Eve. It was erected in a hall (for public amusement) built over a store. The hall was decorated with the evergreens and wild flowers of our island, and bore in letters of living green, these words: "Welcome, Merry Christmas!" The tree was illuminated with many little wax tapers, festooned with strings of pop-corn, and bore aloft fruits more wonderful than Baron Munchausen's, to the utter bewilderment of these "children of the forest" who never before saw a tree of such fruitfulness and variety of production. It was as wonderful as tho' "ready-made-shirt" tree of the Indies, for even the squaws hung on buck skin moccasins for their lords who were white men, and strange tricks and toys for their children who were half-breeds. So you see, being a mixed crowd of recipients, there had to be a greater variety, in order to meet the wants, and tickle the fancies of all grades or classes.

The brass-band from San Juan Island struck up, and the hum of astonishment died away under strains of music powerful enough "to charm the savage breast," after which Rev. Mr. Carr made a short address, then all repeated the Lords Prayer in concert; then came an appropriate dialogue by two little girls, and a song of the "Christ-child." When the last notes died away, in came old Santa Claus with paste-board face, white cotton whiskers and snow-flaked coat. At this unexpected apparition, Indians and half-breeds became pale faces, for a moment, till seeing the kindly intention of old Kris, who began cutting off and distributing the gifts to their savage delight, which was so exuberant they could not repress an audible titter, when by accident old Santa's beard caught fire, and he made some hasty snatches at it, looking more supernatural than ever.

However, no harm was done, and the sparkling eyes of the little *Siteum Cwashes* (half Indians) saw the tree empty and bare by nine o'clock, and pitched out of the window into the bay. Then the band again struck up and dancing commenced, by those accustomed to celebrate Xmas with rude hilarity, while those taught to observe it as sacred retired to the sitting-room of Mrs. Weeks, where a cheery fire and innocent anecdotes enlivened the hours till midnight when supper was commenced. This was a credit to our amiable hostess, and we gave her good proof of our appreciation. The dancing continued till daybreak, when each repaired to his home. We took sail in Billie Barlow's sloop. A stiff south-easter was blowing, so we sped along very pleasantly, until warned by the roll and pitch of the yacht that a reef in our mainsail and jib was required to enable us to jibe, and make another tack to gain Shark's Reef (my landing). So we luffed her up, head in the wind, down came the main sail (all hands to the lower boom!) we hurriedly put in a reef, and as she had no sail to steady her, she rolled and tumbled like a sick horse. Poor Pink and Jauneta wore *paler faces* and they came near relinquishing all claims to the good *muck-a-mucks* (victuals) so carefully stowed away at the breakfast table of good Mrs. Weeks. Rip went the main sail (not so large as at first, but large enough for safety), off on the first tack, off we went jibe, and on the second tack, we brought up at Shark's Reef within forty rods of home, which we reached in a few moments after landing. Then we looked after the safety of our stock; fed the chicks on small grain, the pig and cow on parsnips, carrots, beets, potatoes and slops, since, owing to cold nights corn will not grow here. Thus passed Christmas day on Lopez Island, W. T.

WILL O' THE WISP.

LITTLE FIDO AND THE BEAR.

MRS. E. J. RICHMOND.

WHEN Dr. G. and his pretty young wife decided to take Horace Greeley's advice and "go West," the question arose, "What shall we do with Fido?"

Fido was the family pet, a snow white dog six inches high, but with a spirit as brave as that of any mastiff in the land.

"Take him, of course," said Lottie. "How can we live without Fido?"

"But, my dear, that is absurd. Take a dog a thousand miles!"

However, the deed was done.

This was more than a score of years ago, before the screams of the steam whistle was heard at Valley Home; before Chicago had been lifted from the morass on to firm foundations, while the virgin prairies of Wisconsin waved their billowy grasses and brought forth their beautiful flowers to

"Waste their sweetness on the desert air."

In the midst of one of these prairies Dr. G. located his home. Wandering bands of Indians often passed by the cottage, and the squaws would beg for chickens or milk or bread.

Lottie never denied them, and often the swarthy dames might be seen in pursuit of the chickens which they were sure to run down.

Fido did not like this. He did not like Indians nor prairie wolves, nor badgers, and manifested his displeasure by a sharp, angry bark which did not trouble anybody, and seemed to be a relief to him. One day, or night rather, he found "a foeman worthy of his steel."

The family were seated in the cottage, talking hopefully of the bright prospects before them, and ongingly of the friends they'd left behind, when Fido came running to the door barking violently. Then he ran back to the temporary stables, where the fine horses were kept which the doctor had brought all the way from the old Empire State.

"Fido has started another badger I guess," said the doctor, resuming the conversation. But this did not answer. Back and forth from the stables to the cottage the little sprite ran, almost frantic with excitement, and barking furiously.

At length the family went out with lanterns, to try and quiet the faithful dog more than from fear of any danger.

They found one side of the stable torn off and a horse loose, while both were trembling violently.

Something was moving away across the field and little Fido was in hot pursuit.

"It is a bear," said the doctor, examining the track.

The animal was killed the next day, a huge fellow, who was disappointed in his hoped-for meal off the horses by the spiteful little vixen.

Fido was a hero after this, and always wagged his tail proudly and looked up knowingly when anyone told the story of Fido and the bear.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—Please accept my thanks for the seeds which were received the 26th ult. When the proper time arrives, I will—life spared—sow them and do the best I can in cultivating and caring for the plants. I have my list of flower-seeds nearly completed from D. M. Ferry's Seed Annual, and intend to send for them very soon. Shall not send for very many varieties, as I have several kinds which I saved last season, also ten kinds which came from the RURAL, and Uncle Mark. I have but little time to devote to the care of flowers and prefer a few well cultivated, rather than many neglected.

I want to tell the cousins of something I had last season, which was very pretty. The girls can get their good-natured brothers to assist them in making it, I'm sure. Saw a common flour barrel through the center. (If you wish two tubs, a head can easily be fixed in the open end.) Strengthen the tubs with a couple of hoops. I used green willow, but hoop iron would be more durable. Go to the woods and get some hemlock bark; it must be fresh as bark that has been long peeled, will not bend to the tub. Now nail firmly to the tub, fitting the pieces carefully; saw off the bark even with the tub at top and bottom, and that part is completed. Next drive a round post, three or four inches in diameter, firmly into the ground, leaving from two to three feet above the surface. Set the tub on the post, taking care to have it exactly in the center, and nail, using large nails so as to make it very firm. Fill the tub with good rich soil, and place whatever plants you please therein. Geraniums would be pretty, and if you desire, the pots can be sunk in the soil and the roots remain undisturbed. Any plants that are not very large or tall would look well, by placing the larger in the center, and a row of smaller ones around it. There being such a quantity of soil, it does not dry out quickly, and by watering occasionally, you will have a "thing of beauty," which will be a joy all summer. You can, if you wish, have a small circular flower bed underneath the tub. Pansies thrive exceedingly well, as it is a trifle shady. The next time I write, I hope to be able to tell, not only of plans for the summer, but of plans accomplished. COUSIN NELL.

Broome Co., N. Y.

DEAR UNCLE MARK: In a late number of the RURAL, I read the enquiry, what had become of all the cousins; I answer to the roll call for one, and hope to hear from the rest in due time. I went to school this winter, but now my school has closed. I planted my grape seeds shortly after receiving them, but my pet kitten wishing to explore the contents, upset the basin; we scooped up the dirt and replaced it. I have now two fine strong grape-vines and another one just peeping out. We planted our raspberry bushes in pots as soon as received, and placed them in a south window. To-day I replanted them in the garden; I found they had already sprouted nicely. Now boys it is about time to begin our summer's work. Let us each try and see who can do the best and report. Aside from our garden we can each have a beautiful flower-bed. Many thanks to Uncle Mark for sending me a fine collection of annuals. Before I close I want to tell the cousins that I have a little pet lamb all my own; I love him very dearly; his name is Dick. I have done a little grafting, and will report my success bye and bye. I also received my willow cuttings last night. And now, Uncle Mark, and numerous cousins, I wish you good day.

Lucas Co., Ohio. WALTER GAYHART.

DEAR UNCLE MARK:—I have seen so many letters from the cousins—that I thought I should like to join the club also, if you have not too many nieces and nephews already. We came from the city only about a year ago so I have not had so much chance to learn how to keep a garden as many of the cousins who have always lived in the country. We have not had a very cold winter this year, so we have enjoyed ourselves real well I will not write any more as this is my first letter but, if Uncle Mark will receive me as one of his nieces, I will write again. ELSIE.

Wild Rose, Wis.

YOU DEAR OLD UNCLE:—Please excuse me for for this disrespectful name, but I really couldn't help it. I think you are perfectly splendid to send so many seeds. I mean to have a little round bed for each kind. I suppose most of the cousins have a "Gem Puzzle," or "Game of Fifteen." But I presume they cannot all get it right. I did this morning, by mere chance. What *has* become of Uncle True? I like you better than I did him, though. I like the RURAL better every year.

Your niece, FANNIE S. GIFFORD,

Chautauqua Co., N. Y.

ARITHMETICAL PROBLEM.—A farmer being asked how many potatoes he raised, replied, "I planted three bushels of potatoes in the spring. If what I raise were equivalent to one-third the number of pennies I expended for Paris-green, or three-millionths of the number of Colorado bugs that the land yielded or equal to one twenty-millionth part of the improper words indulged in during the season, I should have potatoes enough to supply the whole world for 10 years!" How many did he raise?"

Miscellaneous.

BRIEFLETS.

THE Queen of England appears to be about the only crowned head in Europe that is not utilized as a target. Perhaps there are no lady-killers in England.—Norristown Herald. . . . Why is it that when a woman has nothing else to occupy her, she invariably rushes off to her dentist's and gets her teeth cobbled till her mouth is like a gold bonanza? Does she enjoy it, or is it just to bankrupt her husband? . . PUCK expresses his views respecting "Oily-margine" in the following impressive manner: The manufacturers of this charming substitute for butter are, we think, being very scurvily treated by the law, the press, and that portion of the public who have been more or less on tasting terms with real butter. . . To be told that their sweet, clarified tallow is not as palatable as the fat made from the milk of the cow, to be nominally obliged to brand it oily-margarine, and thus depreciate their own stuff, is indeed very mortifying. . . But the concoctors of this precious compound do not propose to give up their elegant business without making some effort to convince doubters of the superiority and beauty of the greasy Ambrosia to the regular Orange county article. . . They say that experiments with it, both upon bread and toast, have been wonderfully successful; that a nefarious trade in butter-making has been carried on; that clean and wholesome fat is much better than butter; that there is nothing offensive in oilymargarine; that it is a wholesome luxury for the poor man; that, regarded from a sanitary point of view, spurious butter is away ahead of the real thing, and that the manufacture of oily-margarine is as yet but in its infancy—in which condition we devoutly hope it may remain. . . But we wish it to be distinctly understood that in one shape we have no special objection to oilymargarine in its original form—that is when it exists in its unextracted condition in the live ox or the tender porterhouse steak. . . The manufacturers are, no doubt, very honest and worthy gentlemen; but no sooner are their wares out of their hands than the awkwardness commences. The small, or often the large, grocer sells this vamped-up grease as butter; the boarding-house keeper, if she doesn't buy it as such, makes her confiding boarders believe it is the genuine article, though some poor victim may venture to try to find out what makes the butter taste so confoundedly like fat-drippings. If oilymargarine wants to stand on its merits, let it be colored with harmless dye—red, blue, green; the louder, the better. Then there would be no danger of people who are prejudiced in favor of good old-fashioned butter eating even the choicest clarified beef or pork-fat under a thin disguise. . . Puck, who is really very funny at times, is now talking of a substitute for bread which he calls Breadarine, Lumberine, or Woodeo-sawdusterine. Mr. Edison is the discoverer, it seems. There are no extraordinary difficulties encountered in its manufacture. The saw dust is gathered from the pit of a respectable saw-mill, the chips and splinters are carefully picked out, when it is subjected to a thorough cleansing. It is then placed in a bin, in which a full head of electricity is turned on. This transforms the sawdust into a substance very much superior to flour, and having the same constituents. Water is now added, dough is formed, and by ingeniously constructed machinery for kneading and baking, the Woodeo-sawdusterine loaves are turned out ready for the market. . . The growers of wheat are in despair, and it is very evident they must turn their attention to other callings, for their produce will now be literally worthless. . . The following are analyses of genuine bread and the substitute:

THE WOODEO-SAWDUSTERINE MFG. Co.—

Gentlemen: In accordance with your request, I have analyzed the sample of Woodeo-sawdusterine submitted to me, and take pleasure in informing you that I have found in it no ingredient in the slightest degree injurious to health. I consider it, indeed, as likely to promote robust vigor in people of sedentary habits, and think that it will probably act as a strong moral tonic upon those whose religious education has been neglected early in life. This is my

ANALYSIS.

Pinus Strobus (or American White Pine).....	99.99
Arsenic, Alum, Yeast, Bran, Batter, Paris-Green, Potato-filings, Ink, Salmi de Volaille, Pork, and other foreign substances (approximated)	00.01
	100.00

While in the composition of ordinary bread, made from flour, I find the following

INGREDIENTS.	
Flour.....	99.99
Pinus Strobus, Arsenic, Alum, Yeast, Bran, Batter, Paris-Green, Potato-filings, Ink, Salmi de Volaille, Pork and other foreign substances (approximated).....	00.01
	100.00

From this it will be seen that in all health-giving properties the two manufactures are precisely equal; if anything, the Woodeo-sawdusterine is rather richer in pure nutriment than bread made from flour. I am, gentlemen, yours truly.

J. SMITH, M. D., E. F.,
G. H. I., J. K. L., E. T. C.

. . "Thoughts and Events" remarks: With regard to this matter of advertising especially there are few facts in the history of the press more damning than the prostitution of its great powers to conciliate it. . . We see the firm of B. K. Bliss & Sons mentioned as among the heavy donors to the Herald Irish Relief Fund. . . To stop fits of sneezing, plug the nostrils with cotton wool. Try it. Leave the plugs loose enough to breathe through. . . S. & W. Cooke, of Connecticut (brothers), keep bachelors' hall, do their own work, make and sell excellent butter from eight cows. They are over 70 years of age. . . It is said that the Messrs. Thurber of this city have established a house in London for the sale of oleomargarine. . . To own to having been in the wrong is but saying you are wiser to day than you were yesterday.—POPE. . . When we are alone we have our thoughts to watch, in the family our tempers, in company our tongues.—HANNAH MORE. . . G. W. Hoffman (Elmira Club, reported in the Husbandman) says that two years ago he tried strips through the middle of a field, alternately drilled and sowed by hand, and there was a plain difference in favor of the latter plan; the plants were stronger and more healthy; the strips were sowed and drilled with the same amount of seed to the acre. . . If oats be sown late, more seed to the acre is required than if sown early, because there will be less tillering. . . What a silly question has been started, viz.: Does or does not wheat tiller? Pull up a plant and take a look at it just at this time! . . You may liken thick seeding to stock in the farm yard. Suppose five animals be confined in a yard where they are allowed ample feed upon which they thrive, turn five more in and the supply will be insufficient, so there will be positive loss on the ten. So it is with seed. . . It appears that sewage from cities is not harmful to fish—but the refuse from paper, gas, chemical and other establishments is very injurious. . . Cease pruning as soon as the sap begins to flow. It is better to wait until the tree or vine is in leaf when it will bleed very little if any. . . The "bleeding," even though the tree be not injured thereby, discolors the bark for years. . . Our Aiken, (S. C.) correspondent writes us that from personal observation he finds that the buds of *early* Peaches are injured to the extent that not more than half a crop can be hoped for in that part of the country. Late Peach buds are not appreciably injured. . . Secure the best sorts of corn for seed—prepare the land better than heretofore—cultivate more thoroughly and see if you cannot double your yield with less than a proportionate increase of labor and expense. . . Have you any fruit trees that it would pay to graft? . . In transplanting we charge you not to expose the roots to sun or wind. . . Red-top alone is excellent for seeding a lawn to grass. . . Professor Hilgard (California), reports that seedling Cinchonas are prospering at Berkely, having stood the cold weather with but slight protection. . . The Pacific Rural Press gives much space to the consideration of a new industry. Shellac and laedye, it seems, are found by analysis to exist in large quantities in the resinous substance found on the Creosote plant, Larrea Mexicana which grows in the deserts of Southern California and Arizona. . . We see that the Massachusetts Horticultural Society, at their late exhibition, gave Mr. Peter Henderson a Certificate of Merit for the new Tea-rose "American Banner!" Now, that's glory enough. Mr. Henderson, will you permit us to take back all that we have said that might by any body have been construed as reflecting upon the charms of the A. B.? Long may it wave! May its buds never grow less. . . But, really and truly, we should much like to know what particular "Merit" the Certificate alludes to. . . Marshall P. Wilder's Azalea that measured nearly seven feet in hight and about twenty feet in circumference was *exquisite* indeed. . . Our young friend, Land and Home, has resumed after a two weeks' armistice. The size and price have both been reduced. We hope it may now march on to victory. . . The irrepressible jabber as to whether the Versaillaise and Cherry Currants are the same, still goes on. In view of the fact that, if not precisely alike, there is no marked difference between them, will not horticultural essayists drop the thrice-worn out discussion! There are scores of more recent things about which they might display their careful powers of observation, and instruct their hearers or readers too.

PERSONAL ITEMS.

Senator-elect Mahone, of Virginia, weighs only ninety pounds.

Senator Groome, of Maryland, eats apples and peanuts in the street cars.

Senator Williams, of Kentucky, wears the only wig in the United States Senate.

INGALLS is the thinnest man in Congress and wears a big red handkerchief around his neck.

Blaine will call a new acquaintance by his Christian name before he has known him a fortnight.

The Duke of Westminster, who is the richest man in England, has an annual income of $3,500,000.

Ex-Governor Tilden and Justice Field were schoolmates, the latter boarding at the house of Mrs. Tilden, Samuel J's mother.

The Rev. W. McManus, once a man of brilliant parts, was found dead in a prison cell in Chicago the other day. Drink? Of course.

Mrs. Grossman, of Berlin, Canada, is twenty-six years old, and in seven years of marital life has given birth to twelve children, in ones, twos and threes.

General Imboden, the ex-Confederate cavalry leader, who represents a large number of Northern capitalists, has bought 42,000 acres of mining land in Scott County, Virginia.

Among the unclaimed land patents recently taken from the cobwebbed cuddy-holes of the Land Office was one issued by President Pierce to Abraham Lincoln for service in the Black Hawk war.

Prince Bismarck's sixty-fifth birthday anniversary was celebrated on the 1st instant with all the honors. His palace was flooded with birthday offerings from all parts of Europe. The Emperor William and many other distinguished persons visited him.

Cleanse and moisten the dry stickey mouth of patients and refresh them with Hop Bitters diluted with cool water.

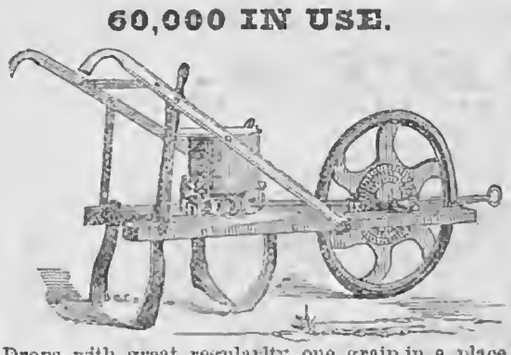
ALBION, MICH.

HOOSIER CORN DRILL!

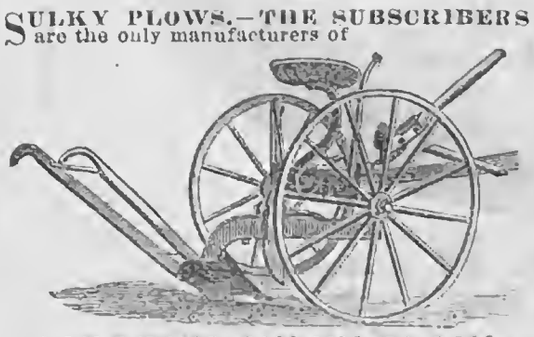
60,000 IN USE.



Drops, with great regularity, one grain in a place, either 12, 16 or 20 inches apart, does the covering uniform in depth, and is both time and labor saving. A given area of corn planted with this machine contains as many plants as when hilled, but their arrangement is such that *each* plant has access to the *same* amount of plant-food that must necessarily be *divided* between from 3 to 5 plants when huddled together in a *hill*. Hence a healthy start and vigorous growth of the plants and the consequent production of **large, well matured** ears, by which the quality is improved, and the yield increased from 10 to 20 bushels per acre, over hill planting are natural results following the use of our **Corn Drill.** Send for circular.

HOOSIER DRILL CO., Richmond, Ind.

SULKY PLOWS.—THE SUBSCRIBERS are the only manufacturers of



OSBORN'S SULKY PLOW,

the only Plowing Machine that has proved a perfect success in all kinds of soil. Any kind of plow can be attached. The plowman rides and handles the plow with ease, regulating the depth and width of furrow. The draft for the team is materially less, and the ordinary laborious mode of plowing is reduced to one of comfort and ease. Sulky made for both right and left hand plows. Also, manufacturers of

THE MEADOW KING MOWER,

and other Agricultural Implements.

THE FERGUSON BUREAU CREAMERY.

Surpasses all others in quantity and quality of butter made. It secures matured and ripened cream, which makes butter of the best texture, flavor, and of unequaled keeping quality. It excludes flies, dust and odors; is constantly at the correct temperature (58° to 62°); has room for the cream and butter, and saves three-fourths the labor. It can be used with either ice or water, and both summer and winter.

THE FERGUSON CONCUSSION CHURN is the best. It combines scientific principles with the best labor saving devices. No floats or paddles. Brings the butter in granular form, and secures the largest yield. Before buying any other **Churn or Creamery** or any pans, or cans, send for large Illustrated circular to **THE FERGUSON MF'G CO., Burlington, Vt.** Reliable Agents Wanted.

Humorous.

JUDGE MARTIN decided at Bridgeport, the other day, that certain evidence was inadmissible. The attorney took strong exception to the ruling, and insisted that it was admissible. "I know, your honor," said he warmly, "that it is proper evidence. Here I have been practicing at the bar for forty years, and now I want to know if I am a fool?" "That," quietly replied the court, "is a question of fact, and not of law, and so I won't pass upon it, but will let the jury decide."—New Haven Palladium.

A CONTEMPORARY asks Puck: "Is kissing dangerous?" and that paper answers: "That altogether depends. If the young lady ignores poisonous enamels, and her father doesn't enter the parlor in the midst of the labial exercises, kissing may be indulged in with impunity. Kissing another man's wife is dangerous, we believe—if her husband catches them in the act."

THE DAIRY-MAID OF THE PAST.

THE DAIRY-MAN OF THE PRESENT.—[Puck.]

Establish Healthful Co-operation.

Between the stomach, the liver and the bowels, if you want to banish sick headaches, nervousness, and mental despondency. Upon the vigor of the first named organ depends the good service of the two latter. That fine stomachic, Hostetter's Bitters, pure, approved by physicians, derived from the best botanic sources, soon puts to rout the symptoms which make the lives of nervous, bilious invalids miserable. The very fountain head of such trouble is feebleness of digestion, for which it is an incomparable, long established and widely celebrated remedy. It builds up the constitution when shaken by disease, and protects it against malarial and other hurtful influences. It is an agreeable appetizer, a useful strengthening cordial for the convalescent, and greatly mitigates the gathering infirmities of age.

KŒLREUTERIA PANICULATA.—From Nature.—Fig. 120.

Arboricultural.

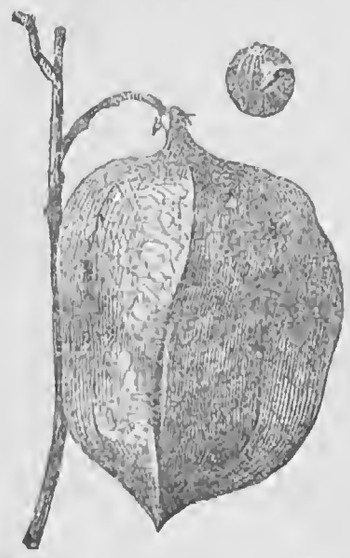
THE KŒLREUTERIA PANICULATA.

Some plants have become generally known through the medium of catalogues and periodicals, and yet are seldom seen on the lawn. Excuses might be accepted for this, if the plants were insignificant, ornamentally considered, but in the case of the Koelreuteria this is far from true.

Nor is it a new plant. Over a hundred years ago, it was brought from China and grown with due appreciation in England. Difficulty of propagation cannot be offered as a reason for its neglect, since it both seeds freely and germinates readily. Propagation from seed, however, seems to be the successful method of growing it. The lack of appreciation in such cases can only be excused on a plea of ignorance. People have simply not seen it, or employed its excellent qualities. No other excuse can be rendered. It is, in fact, a thrifty rapid-growing tree, possessed of all the better qualities that characterize our choicest class of hardy ornamental plants. Practically speaking, it is quite hardy in every situation wherein I have seen it tested. As it is also easily transplanted, it will be readily seen how useful a lawn tree it becomes. Its size at maturity is medium, and its general contour low and umbrella-like.

The entire aspect of the tree is feathery and graceful, full of sunlight rather than shade. Indeed the foliage is very charming in appearance during the greater part of the year. All the interior of the body of the tree is devoid of leaves which cluster in feathery tufts or masses on the outer portions of the branches. The leaves proper are large and pinnate, that is, consist of a number of leaflets arranged on either side of a leaf stalk, as in the Ailanthus. This openness of leaf as well as the general light-yellow hue, gives rise to a warm sunny tone, very peculiar as seen upon the lawn. Such traits make the appearance of the Koelreuteria very effective contrasted with a mass of the darker foliage of other deciduous trees—that of the Norway Maple, for instance.

Another interesting feature of the Koelreuteria is its flowers. Of a beautiful yellow color, they stand in large panicles of inflorescence, very different in appearance from the drooping yellow flowers of the Laburnum.



SEED AND CAPSULE OF KOELREUTERIA PANICULATA.—FROM NATURE.—FIG. 121.

Another special feature of the large open cluster borne by the Koelreuteria is the fact that they appear on a fair-sized tree in July. Few fair-sized trees bear flowers conspicuous either for color or magnitude, and still fewer bloom as late as July. We find, therefore a double attraction in the flowers of the Koelreuteria. The fresh warmth of the yellowish color of the younger portions of the bark is also pleasing, so that, to sum up, we find in this tree the following excellent qualities, viz.: warm, sunny-tinted, feathery foliage worn as a crown on more or less naked branches, bright-colored bark and lovely yellow flowers borne in July. Other valuable qualities of easy propagation and transplanting as well as hardiness and fair vigor combine to make the Koelreuteria a tree that should win for itself invariably a conspicuous place.

There is a Japanese variety of Koelreuteria paniculata that deserves passing mention simply for its shorter panicles of flowers and slightly different general habit.

Samuel Parsons, Jr.

[Koelreuteria paniculata.

At first glance, it would scarcely appear that the Koelreuteria is a very near relative of the Horse Chestnut. They present upon a closer scrutiny, however, so many resemblances that botanists class them in the same family; viz., Soapberry (Sapindaceæ).

The tree from which our drawing was made was planted in the Rural Grounds seven years ago. It is now about seven feet high, showing little disposition to increase much in hight. The top is spreading, but the branches and main stem are crooked and irregular.

The flowers though individually small are quite showy, as seen in the panicles which are liberally produced in early summer. The inflated seed-pods persist for a long time, though by no means adding to the ornamental appearance of the tree. One of the capsules and a single seed, of life size, are shown on this page. It is thoroughly hardy with us.

Farm Topics.

WHAT IS THE TRUE MONEY VALUE OF LEACHED ASHES?

PROFESSOR F. H. STORER.

Farmers have been so long accustomed to compare leached ashes with wood ashes (*i. e.*, "live ashes") and to regard them in some sort as a weaker representative of, or substitute for, wood ashes that the real significance of the leached product seems to be not clearly understood. In point of fact, leached ashes and wood ashes are not comparable as fertilizers. They belong to totally distinct classes. Wood ashes are clearly to be classed among the potassic fertilizers, while leached ashes cannot be so classed; they fall naturally among the calcareous fertilizers. Wood ashes do indeed contain other valuable constituents besides potash—lime among others—and they have certain peculiar qualities which need not be discussed in this connection; but the fact remains that they differ so decidedly from leached ashes that the two materials do not admit of any close comparison.

It has long been known to chemists that leached ashes contain hardly any potash, and this truth was exhibited most emphatically some eight or nine years since by a number of analyses made by Professor Johnson, of New Haven. Yet to this day most experiments with leached ashes are made, as they have been from the times of the first settlers, with the view of testing the old question: "Are leached ashes as good as unleached?" I would not in the least undervalue such experiments. It has appeared indeed that upon not a few soils the question here stated has been answered in the affirmative. It is important any-way for every farmer to learn by trial whether his land is specially grateful for lime, or lime-carbonate, for potash salts, or for the caustic, alkaline effect of wood ashes, and so forth. But there is another kind of experiment which might be made with leached ashes, which ought to be made in many places, and that is the comparison of leached ashes with lime, applied in various forms, with the view of obtaining in the cheapest possible way results as good as those afforded by leached ashes.

Professor Johnson's analyses show that the average composition of leached ashes, as brought into New England from Canada, is

Water	35.34
Sand, clay and charcoal	11.47
Iron oxide	1.50
Lime	25.99
Magnesia	3.30
Potash and soda	1.27
Phosphoric acid	1.44
Sulphuric acid	0.11
Carbonic acid	17.49
Silica (soluble)	2.09
	100.00

And that a struck bushel of leached ashes, weighing 55 pounds, contains pounds of

Water	19.44
Sand, clay and charcoal	6.31
Iron oxide	0.82
Lime	14.30
Magnesia	1.81
Potash and soda	0.70
Phosphoric acid	0.80
Sulphuric acid	0.06
Carbonic acid	9.61
Silica (soluble)	1.15
	55.00

In view of these analyses, and of the facts so often asserted: 1st, that unleached ashes have been found to be as useful as leached upon some soils; and 2d, that excellent results are sometimes obtained by using comparatively small quantities of leached ashes in conjunction with dung or some other fertilizer, it is hard to escape the conviction that the fertilizing effects of leached ashes must depend primarily upon the 24 or 25 lbs. of carbonate of lime that are contained in each bushel of the material.

The calcareous constituent is so predominant and the esteem in which leached ashes are held is so great and peculiar, in the localities where they are largely used, that it may fairly be inferred that their merit depends chiefly upon the lime-carbonate. But if this inference is correct, the question is at once opened, why should not the farmers use other forms of the lime-carbonate, which may be had at cheap rates, instead of importing leached ashes from abroad? This is a question which can be answered only by experiments, such as can best be performed on the large scale by the farmers themselves, and each of the experiments should be made to last for several years, or until a definite result has been reached by means of it.

Theoretically, the question to be determined is simply: cannot some cheaper form of carbonate of lime be used to replace leached ashes? And if a chemist were to test the matter he would be apt to use powdered chalk, or perhaps even the prepared chalk called "whiting," taking for his trials quantities of chalk equal to the amount of lime-carbonate contained in the dressing of leached ashes with which the chalk was to be compared. But practically the question is not so simple. It divides itself into several subordinate inquiries looking to the practicability of getting the useful lime compound in some cheaper form than chalk, by using shell-lime or some other of the cheap limes that are sold for agricultural purposes.

There are several ways of testing the matter, and each of them is worthy of being tried on the large scale in the districts where leached ashes are esteemed. One way would be to "lime" a part of a field outright, by burying small heaps of quick-lime at proper intervals upon the field in spring or autumn, and spreading, as soon as may be practicable, the fine powdery product which is formed after a little time from the slaking of the lime by the moisture of the soil. By dressing another part of the field with leached ashes, and leaving yet another portion unfertilized, it would be possible to gain some just conceptions as to the comparative merits of the fertilizers. The slaked lime obtained in the manner just described, would naturally soon be converted into carbonate of lime by absorbing carbonic acid from the air and from the soil; but the experiment, considered as an experiment, will, of course, be complicated by the fact that for a certain space of time caustic lime is in contact with the soil. It could never be told with certainty precisely what part of the good, or perchance the bad, effects of the liming operation were to be attributed to the slaked lime or to the lime-carbonate formed from it. The failure of such an experiment would in no wise prove that carbonate of lime cannot be used to replace leached ashes; but, on the other hand, from the very simplicity of the trial, any successful results obtained by means of it would be specially valuable; and the chances are that in many cases the lime would turn out to be a better application than the leached ashes.

There can hardly be a doubt that many comparisons of lime with leached ashes, in the sense of the foregoing proposal, have actually been made already by American farmers, and it would be well if all of them could be collected and studied anew in the light of what is now known of the composition and modes of action of both these fertilizers.

Another way of proceeding would be to use air-slaked lime in comparison with the leached ashes, or rather lime which has first been slaked with water and then exposed to the air until it has become carbonated, for quick-lime is partially carbonated when permitted to slake slowly in the air. Lime is often sold in the slaked condition for agricultural purposes, and might be spread out in a thin layer, in a barn cellar, for example, and left for a number of weeks, with occasional rakings, until it had become saturated with carbonic acid by absorbtion from the air. In case only quick-lime is procurable, some of it might be slaked with about half its weight of water and then exposed to the air. Allowing for impurities in the quick-lime, some 25 or 30 pounds of the carbonated product might be used against a bushel of leached ashes.

Still another practical term of comparison could be obtained by preparing a quantity of compost with lime and peat and contrasting this product with the leached ashes, though, of course, a good part of the benefit derivable from the compost might be due to the nitrogenous matters contained in it.

Some years since an article called oyster-shell flour, obtained by grinding oyster shells extremely fine, was procurable in Boston, which might have been used for experiments such as are here proposed, though it is doubtful whether this flour would have been found so economical a fertilizer as slaked oyster-shell lime. No process of mechanical attrition is likely to give the fineness and openness to the action of the solvents which results from a chemical operation such as the slaking of lime. In some experiments of my own, which were published in the Bussey Bulletin, oyster-shell lime gave rather better results than were obtained from this oyster-shell flour.

The spent lime obtainable from soap boilers in the vicinity of cities may very properly be used, after it has become dry, for experiments such as are here suggested. But the spent lime from gas works would hardly be fit for these trials. Not only does it contain, when fresh, certain tarry matters and sulphur-compounds which are obnoxious to vegetation, but even after weathering, it may well retain enough empyreumatic matter to hinder the process of nitrification, the promotion of which in the soil is probably one great merit of leached ashes and the other forms of carbonate of lime.

For cases where small quantities of leached ashes are used, as when the farmer puts a handful of the material on each hill of corn, it would be an easy and not a particularly expensive matter, to use whiting upon some of the rows, instead of the leached ashes. It would be necessary only to determine how many handfuls go to the bushel, or, more simply, how much a handful of leached ashes weighs, and to apply the whiting with some kind of a spoon which shall give to each hill of corn as much whiting as is equal to 25-fifty-fifths the weight of a handful of leached ashes.

With regard to the cost of substituting lime for leached ashes, in the manner above indicated, it is easy to show that in many localities it could not be great. If it be admitted, for the sake of the argument, that the farmer can obtain quick-lime at eight cents the bushel, which is, I believe, a liberal allowance for many of the localities on the sea coast where leached ashes are largely used; and that each bushel of the quick-lime will make two bushels of slaked lime of 40 pounds each, and that the slaked lime contains no more than ten per cent. of impurities, then each bushel of the slaked lime would produce, by exposure to the soil or air, some 48 pounds of carbonate of lime, or say twice as much as there is in a bushel of leached ashes. Hence, in so far as the lime carbonate is concerned, a bushel of the slaked and aired lime for which four cents have been expended, will be worth as much as two bushels of leached ashes, costing some 20 or 25 cents apiece.

I am well aware that in some instances very large quantities of leached ashes are applied to the land, sometimes as many as 200 or 300 bushels to the acre, and that in such cases the small proportion of potash and phosphoric acid and magnesia which the material contains may be of real utility to the crops, considered simply as sources of plant-food; but it is equally true that there are many cases where this view cannot be entertained, and it is still questionable how much importance should be attached to these incidental constituents, even in those instances where the largest quantities of leached ashes are applied to the land. In case it should be found in some places that the action of these incidental constituents cannot be spared, it would still be easy, as Prof. Johnson has urged, to add to the quick lime a quantity of Stassfurt potash-salts, and of bone-meal, or another phosphate, in order to make good the deficiency. Per contra, it has often been noticed that there is little use in repeating the application of leached ashes too often. The approved method of dealing with them is to apply them once in a while and to use other fertilizers between times to keep the land in good heart. This custom, so closely allied to the old practice of "marling," goes to show again that leached ashes are to be classed as a calcareous manure.

Field Crops.

SOME PASTURE GRASSES, AND THE TREATMENT OF PASTURE LANDS.

HUGH L. WYSOR.

Advocating the division of the farm into arable and pasture land, I stated in my article on fences, in the Rural for January 24, that the principal objection which could be urged against the plan would be the failure of the grass on the pasture land, which, in course of time, would need the intervention of the plow. I have several times suggested the plan to graziers here, and their reply has invariably been that except on the swales and low-lands the grass will run out in six or seven years, and on the more exposed portions of the fields sooner than this. At the same time they acknowledge that the best pastures here have not been broken up within forty years. I am told that the best pastures in England have not been touched by the plow within a hundred years. It is acknowledged that one cause of the short duration of grasses on pastures is, that the kinds generally sown are not adapted to permanent pastures. It is the general practise of farmers in the United States in sowing their lands down to grass, whether designed for meadow or for pasture, to sow only two kinds—timothy and clover, frequently clover alone. On many farms here, it is only necessary to sow clover, as by the time it has run out, the Kentucky blue grass will have possession. Now, all the treatises on grasses advise the sowing of a mixture of as many as eight or ten different kinds. Practically this advice cannot be followed, because so many are either not to be had in the market, or can be obtained only at prices which no man can profitably afford to pay for them. In laying down lawns or small plots, the plan would answer; but when it is a matter of hundreds of acres, it is out of the question. There are essentially only four perennial grasses which are commonly quoted in our markets. These are timothy, orchard grass, red-top, and Randall grass. I propose to notice them briefly.

Timothy,

called cat's-tail in England, and herd's grass in New England—a name applied to red top in the Middle States—is probably the most nutritious of all perennials. It is excellent for meadows, and makes more and better hay than any other grass. But from its peculiar habit of growth—sprouting at or near the surface of the ground from a bulb, which being cut or bitten off, the plant is destroyed—and from its scanty aftermath and slow growth after being cropped, it is poorly adapted to permanent pastures.

Red-top,

although, I believe, not liked in Pennsylvania, is a grass not at all to be despised. It makes

a sward so fine and firm in texture as to be scarcely, if at all, inferior to that of blue grass. While its native habitat is on wet or almost swampy lands, it will thrive anywhere. Indeed, some of our best upland pastures are made up entirely of this grass. It should never be omitted in mixtures intended for permanent pastures.

Orchard Grass

I do not hold in any high estimation, except for situations where better grasses will not succeed. It is admirably adapted to soils which are loose in texture, such as sands and gravels. It is inclined to grow in tufts, does not make a close sward, and is so coarse that stock will not readily eat it, if they can get anything better. I have lately seen inquiries in the papers as to whether this grass is the same as that which is commonly known as dog's-foot. In England, it goes under the name of cock's-foot, but our old farmers here call it dog's-foot. It appears to me that the shape of the panicles resembles more a dog's than a cock's foot. As there is another grass which in the South is called by the latter name (Panicum Crus-galli) the former would seem to be preferable. There is one fact connected with the seed of this grass as generally offered in the market, which ought to be noticed, and that is, that about one-half of it is pure chaff. The bundles of straw containing the seed are left out in the field till they are about half-rotted. They are then taken up one by one and tapped with a stick, the seed falling out on a sheet spread beneath. These are then put in bags and, without further preparation, offered for sale. What seed remains in the bundles after this process, is afterwards thrashed out with flails, the seed being slightly fanned with a sheet as it lies in bulk. The proper way to clean them is to run them through a wheat fan. If properly managed, no good seed will be blown away, and they will be thoroughly cleared of all chaff except that within which the kernels are inclosed. The naked kernels—not being much larger than pin points—cannot be separated from the glumes. From the circumstances stated above, more seed must be sown than otherwise would be necessary.

Meadow Fescue,

known in Virginia as Randall grass, is in the opinion of many a much more valuable grass than orchard. It puts forth as early in the spring, remains as late in the fall, yields an equally luxuriant aftermath, and is much finer in texture. It succeeds in nearly all situations. I have seen it growing moderately rank in the bottom and on the sides of washed-out gullies where there was no appearance of soil. It is quoted in seedsmen's catalogues at from 30 to 40c. per pound; but can frequently be had in our Virginia markets at from $1.25 to $1.50 per bushel of 14 lbs. Some years ago, a writer in the Southern Farmer, stated that this grass was called Evergreen in this county from its remaining green throughout the season. This is an error. The grass locally called here Evergreen is the Tall-meadow oat grass of the books. [It is called "Evergreen" in North Carolina. Eds.] For laying down pastures, then, I would recommend red clover, with all three, or any one or two of the three, grasses last above noticed. As to

Blue or June Grass—(Poa pratensis),

its seeds from the low growth of the plant are not easily saved and can be with difficulty obtained in large quantities. However, where it grows naturally, it is abundantly able to take care of itself without any seed. Give it only a foot-hold, and it will root out and destroy the other grasses and usurp the entire premises. But when once a heavy blue grass sod is obtained, there is nothing further or better to be desired. The owner of such a sod should never allow himself even to think of putting a plow in it. There is another grass often seen in old pastures called wire blue grass (Poa compressa) which affords short but nutritious grazing. It seldom sends up stems exceeding a foot in height.

It remains to consider

The After Treatment of Pastures

when they begin to fail. In the first place, I have known old timothy meadows to be renewed by simply resowing the seed, and dragging over them a common "A" harrow with newly sharpened teeth. But the harrow is not a very effective implement for this purpose, as it can only penetrate the soil from the force of its own weight. On heavy swards, and particularly on tenacious clays, it would scarcely make a mark that could be seen. It might be said that some of the improved harrows would do for this work, but I am inclined to think they would not. The Randall wheel harrow, which weighs 500 pounds, would perhaps penetrate the soil deep enough, but then if the discs were set with the line of draft, they would not disturb the sod at all; if they were set at an angle with the line of draft, they would turn furrows, which would not be what was wanted. The only implement at present to be had which can be relied on, is the common single coulter. This, while very slow, is an effective tool, and will tear up and scarify the sod to perfection. In the absence of manure, which can seldom or never be spared from the cereals, the scarifying of the sod is all that can be done to revive our pastures, and really on good lands it is all that is needed. In cases where the sod has simply become moss-grown, it will answer without reseeding the land. Scarifying the sod will have as great an effect on the growth of the grass, as plowing other crops has on them. It is unfortunate that we have no implement specially adapted for accomplishing this work speedily, as they have in England. One of these English implements, Finlayson's scarifyer, exhibited astonishing powers in breaking up Hyde Park in 1826. It is made with an iron frame somewhat in the shape of an "A" harrow set on low wheels. There are nine curved steel tines set in the frame and pointed to enter the ground, the depth being regulated by a lever set up on the apex of the harrow, and running back within reach of the driver's hand. Running at full depth, the teeth will penetrate the ground eight or nine inches. All this class of British implements are very powerful, and could be largely used in place of plows on stubble land, as well shown by Mr. Fowler in the RURAL of January 31st.

Pulaski Co., Va.

SORGHUM HALEPENSE.—FIG. 122.

SORGHUM HALEPENSE.

JOHNSON GRASS, FALSE GUINEA GRASS, MEANS GRASS, EGYPTIAN GRASS, GREEN VALLEY GRASS, CUBA GRASS, ETC.—I quote from the Report of the Department of Agriculture for 1878:

"A perennial grass with strong, vigorous roots, and an abundance of long and tolerably broad leaves. Its stems attain a hight of five to six feet, with a large and spreading panicle. The flowers and seeds are much like those of broom-corn. It has been much discussed in the Southern Journals."

This is not hardy at the North. It has been several times highly extolled in advertisements. It is said to send up a tender stem early in spring and on good land may be mowed half a dozen times in the year, yielding a good crop each time. "Stock love it and give the preference to it over any other growth." The rhizomas or root-stocks, often called roots, are very numerous, long and as large as one's fingers. These sprout freely and make the plant very tenacious of its footing, when once introduced. Much after the manner of quack grass, it comes to stay when it falls in ground and in a climate suitable to its growth. The seeds will grow freely, so will fragments of the root-stocks. Having seen this grass and read much of it, the writer thinks the virtues of all grasses are not combined in this one.

PROFESSOR W. J. BEAL.

SEVERAL SOUTHERN GRASSES, AND THEIR POSSIBLE VALUE AT THE NORTH.

M. B. BATEHAM.

THE remarks on "Teosinte" in the RURAL of January 10, prompts me to say a few words about two or three other Southern grasses—not much known as yet; and to suggest the inquiry whether some one of them may not possibly be found of value to stock and dairy farmers in our central and southern States, as well as in the South.

The great desideratum with this class of our farmers is, some forage plant of vigorous growth and perennial habit that will withstand the summer droughts that so frequently occur and cause the failure of ordinary grasses and forage crops. It needs to be something that produces plentifully with little care and labor, is relished by cattle, both green and as hay, and will bear cutting repeatedly during the summer.

Leaving Lucerne ("Alfalfa,") out of the list, as not a grass, and not suited to the generality of our soils, besides not being good for hay, is there any one of the Southern exotic grasses, of the Sorghum or Panicum family, that will nearly meet these requirements?

Green Valley Grass, Sorghum Halepense.

It was mentioned in the RURAL last summer that some parties in Missouri and southern Iowa were advertising a supposed new forage plant, under the name of "Green Valley Grass," said to have been recently introduced from the West Indies, and wonderfully productive of nutritious green food and hay, and withstanding the severest droughts. Wishing to learn more about it, I wrote to the principal advertiser, asking for a few of the roots, as it was a perennial, and inquiring if he could give me its botanic name. He sent the roots promptly, and said he had not been able to learn the botanic name of the grass, and he wished I would do so when it came into bloom. So, when the time arrived I sent one of the heads to Professor Asa Gray, and he pronounced it Sorghum halepense; and this I knew, from the Reports of the Department of Agriculture, had been grown and written about for a number of years in several of the Southern States; was called Guinea Grass by some, and Johnson Grass by others, the latter name being preferred, as there is another Guinea Grass which is a species of Panicum. Several writers speak in very high terms of this Johnson Grass, as affording the greatest abundance of pasturage and fodder, requiring to be cut four or five times in a season to prevent its growing too tall, and that its roots were so vigorous and enduring as to withstand severe droughts.

In my own experiment, I planted the roots last May, in poor sandy ground, at a very dry time, and gave them no water or culture; but the plants grew to five or six feet in hight, with leaves and branches on the sides, showing a disposition to produce plenty of forage; and as the whole season was remarkably dry, I was convinced that all which had been said in regard to the ability of this grass to withstand drought is true. But now comes the question:—Will it endure our winters? I presume not—and this is a serious difficulty, but perhaps not insurmountable.

Mr. Taylor of Missouri says, in that climate, the past severe winter, while the surface roots were killed there were plenty of the lower roots that kept alive to renew the crop, and he believes that the same will prove true with it in Ohio and similar latitudes, as the plant has very strong and jointed root-stems, some of which run quite deep, and from which new shoots arise. Indeed, it is made a serious objection to it, by some people, that on account of this habit of growth it is very difficult to eradicate where it has once got possession; and the best way to make new plantations is, to break up these rhizomas and scatter the pieces in furrows, like sowing corn for fodder.

Now, in case the roots will not withstand our winters without protection, it is possible they will do so by having the ground ridged with a plow in the fall so as to turn the soil over the rows of plants, then harrowing it down in the spring, or, if that will not suffice, it will not be much work to plow up a wagon-load or two of the surface roots in the fall and store them in a root cellar, or cover them in a pit for the winter, and plant them in the spring. This may be found to pay, if the plant proves as productive of green food or fodder, and as capable of withstanding drought as my single experiment seems to indicate. In order to test the question of winter treatment, I have left some plants entirely unprotected this winter, ridged the ground over others with a hoe, buried some in the ground below the reach of frost, and put some in a cellar with potatoes.

Guinea Grass Proper—Panicum Jumentorum,

is another Southern plant, introduced into Florida from the West Indies some years ago, by Mr. Codrington, now editor of the Florida Agriculturist, at Deland. He claims that this is much superior to the Johnson Grass or Sorghum halepense, at least for that portion of the South: that it is equally as productive, and more nutritious for cattle, besides being less exhausting to land and less difficult to eradicate.

Mr. Charles Mohr, a botanist of Mobile, and author of a treatise on the grasses and trees of Alabama, says the Guinea Grass—Panicum—is regarded as superior to the Johnson Grass—Sorghum—though both are quite valuable and of similar habits of growth; both are perennial and easily propagated from the roots. Seeds are readily saved of the latter, but not of the former, as they ripen but few at a time, and drop as fast as they ripen. Both species need cutting four or five times during the summer, and make good hay if not allowed to grow too tall, and an abundance of pasture; but neither will endure frost; they are said to be natives of Africa.

Para Grass.

Another new species of grass, said to be superior to both the others for the extreme South, has recently been introduced by Mr. Codrington, from the West Indies, where it is called "Para Grass," having been introduced there from the Para valley in Brazil. Mr. Mohr writes me that he has seen but little of this grass, but he thinks very favorably of it for the Gulf region, especially for moist or wet soils, for which it seems especially adapted. It appears to be of the genus Panicum, the specific name not being yet determined. It is immensely productive of leaves and stalks, which

are sweet to the taste and much relished by cattle. Like the other two, it is propagated by

PANICLE OF SORGHUM HALEPENSE.—FIG. 123.

its large creeping roots, and needs to be cut repeatedly during summer.

It is my impression that this last will not prove of value at the North; but I think the others are, at least worthy of trial, for the purposes I have stated, and in the manner suggested.

[The large cut of Sorghum halepense, which is taken from the last Agricultural Report, does not seem to us accurate. The simple panicle is our own from nature. Our correspondent at Aiken, S. C., says, in the RURAL of March 27th: "Sorghum halepense is also being tested here, with some promise that it may prove of value in this land which so stands in need of this class of plants. The roots are quite hardy here and the leaves are now a foot high. The roots, or rather root-stocks, form a complete net-work in the soil of which they will take possession in a few years. How long, however, they will yield a paying quantity of leaves is not yet known."—EDS.]

Miscellaneous.

NOTES FROM AIKEN, S. C.

P. J. BERCKMANS'S HOME.

I TOOK a run *down* (we are 600 feet above sea level here) to Augusta t'other day—thence to the nursery, farm and home of P. J. Berckmans, situated about five miles out of that very respectable city. After running *down* to Augusta, one must run *up* to Mr. B.'s, for his home is nearly as high as Aiken—the difference being scarcely more than 100 feet.

A little world within itself! When have I seen a bit of country in my Southern travels that so combined the desirable characteristics of the North and South! Never before? Hardly ever before, I may truly say. Mr. Berckmans has *grass* about him—the very thing beyond all others that a Northern man yearns for after he has lived in the South long enough to prize it adequately—grass, winter and summer! As one enters the carriage gate, a straight avenue, 750 feet in length, confronts him, lined (twenty feet apart) with the incomparable Southern Magnolia—M. grandiflora. What a grand tree to be sure! You have at the North trees which in summer may be compared to this. But taken the year round, it has always seemed to me the noblest—the finest tree that grows upon the face of the earth. This avenue leads to a large, square, plain, substantial building—the Berckmans home—and those qualities, if I may so speak, are found, by all who know them, to be nobly personified in the members of this worthy family. Hills and valleys on every hand spread out, but the view is intercepted by pine forests in such a manner as to suggest the "little world within itself," comprising, in all, 500 acres. It is full of surprises. Now we are in a forest. In a minute more we are in a peach orchard—a strawberry plantation or an oat field.

"How many oats per acre?" I asked, as we looked at the oat field.

"Oh! sixty bushels," he replied.

"What manure?" I asked.

"None," he replied. "Our oats sown in October are ready to cut about the middle of May. The stubble is turned under and Cow-peas are sown at once. These are cut for hay—and a fine hay they make—in August. The peas continue to spread and grow and this second growth is turned under and oats sown in October or November, according to the season."

"How long can this be kept up?" I asked.

"Forever," he replied—"and the longer, the better!"

Near the house several men were digging under what looked to be Couch or Quick grass (Triticum repens). The grass and roots were cut up in pieces two or three inches long—spread thickly upon the ground and then spaded under.

"What is it, I inquired?"

"BERMUDA GRASS," he replied, "the great boon to the Southern people and country! You know it does not seed, so that we propagate it in this way."

"Does it keep green during your summers?"

"Yes," he said, "if clipped or mowed the same as you would treat your Northern lawns. As a forage plant," he continued, "it is invaluable. Mr. Ravenell has harvested ten tons per acre on ground that would not produce twelve bushels of corn per acre. He uses Bermuda grass and Vetch. (Vicia Cracca—not sativa). The Vetch is rolled and affords pabulum for the Bermuda. This dies down in April and seeds itself for next year's growth."

"Have you the Hydra grass?"

"Yes, and we do not fear it, either. The fact is, NO plant is to be feared under cultivation."

This is known too as Nut grass—botanically, Cyperus rotundus var. Hydra—and is generally deemed the vilest pest that ever cursed the husbandman. When Southern farmers are ready to praise or even speak toleratingly of what has previously been cursed without stint, it may be supposed that revolutions here as elsewhere are going on in farming.

I hear an everlasting deal of talk about the "Capabilities and Possibilities of the South." Some of them are no doubt visionary enough—the rest not only practicable, but easy of accomplishment. What is still needed (in my poor judgment) is Energy—and that alone. Then the "possibilities" and "capabilities" will find a quick demonstration. But the climate is enervating. Northern people who are frisky enough at home and who "drive" things unceasingly, here soon wear off the wiry edge and become as obtuse and easy-going as those "to the manor born." Still there are exceptions, and these are the ones who, when "established" in the South, seldom care to be transplanted to their quondam Northern homes.

On and off, Mr. Berckman has had strawberries during the entire winter, for you must know the winter here has been exceptional as well as at the North and West. As we stood surveying two large fields of various kinds, I

TWIG OF CORK OAK.—FROM NATURE.—FIG. 124.

asked what kinds best suited the climate. He replied "Wilson first; next, Monarch of the West; then Cumberland Triumph, Black Defiance and Kentucky."

Col. Cheney is also fine here. Along the coast there is none so much esteemed for market as Nunan. It is by far the earliest. It is mulched with pine straw, and, thus treated, they get three quarts of Nunan where they get one of Wilson or any other. [The engraving is made from an average berry sent to us by "Major" from Aiken, and received in good order.—EDS.] The berry at first colors in blotches of bright red. Picked at this time, it will carry for long distances. But it is always sour and, in fact, is simply to the South what the Wilson is to the North.

Near the avenue of Magnolias alluded to, grows a Cork Oak—Querens suber. It is about 14 inches in diameter and sixteen years old, as I remember. I send you a twig for illustration. Mr. Berckmans cut out a piece of the bark three inches long and one deep. It seems to be of fair quality.

[This is the species of Oak that supplies the world with cork. Its home is in southern Europe and northern Africa, where it grows in abundance, especially in Portugal and Spain. The first stripping takes place when the tree is fifteen years old. This is called virgin cork and is useful only as a tanning material and for forming rustic work. Subsequently the cork is removed every eight or ten years, and the trees continue to thrive under the operation for upwards of 150 years. The annual cork harvest from the regions mentioned above, is estimated at about 12,000 tons. —EDS.]

My stay at Mr. Berckman's was so short that I cannot do justice to his nursery grounds, greenhouses and the natural beauty of his little world, so I pass them without notice. But I may be pardoned for expressing my satisfaction at having become acquainted with this worthy gentleman and his congenial family, who, through many years of earnest attention to their chosen occupation, have yet always managed to find time to entertain those who visit them, with that rare and delightful hospitality that seems to spring from a desire, first of all, to please and profit others.

NUNAN STRAWBERRY.—FROM NATURE.—FIG. 125.

The Apiarian.

A HOUSE APIARY.

A PROPER summer and winter dwelling for bees needs two requisites—to be cool in summer and warm in winter. It should be a double-walled house, which may be rectangular or octagonal in form and of such dimensions as the present and prospective needs of the apiary may demand. The outer wall is best made of brick and as thin as possible. Inside of this there should be wooden strips two inches thick, which should receive a layer of paper sheeting inside, which may be held by nailing strips two inches wide immediately inside the first-mentioned strips. These last strips should receive lath, after which all should be plastered. This may cost more than a purely wooden structure, but it will be more nearly frost-proof than any other kind of wall, and in the end will be the cheapest. If it is desired to build the outer wall of wood rather than brick, let it be of matched plank or double-boarded. There will be two dead-air chambers, each two inches deep—one between the paper and the wall, the other between the paper and the plaster. The entire wall will be nearly eight inches thick. If desired, it may be made less thick by using one-inch strips, though for our very severe winters the above is none too thick. The doors and windows should be double and should all shut closely against rubber. The outer one should consist of glass, and should be so hung as to swing out.

In hot weather it should be replaced with door and window screens of coarse, painted wire gauze. A small window, just above each colony of bees, is very desirable. I would have the building but one story, with joists and ceiling above, eight inches thick. Above these I would sheet with building paper, fastened by nailing strips two inches deep on top, above which I would ceil with matched boards. Lath and plaster below the joists. The hives, which are to be kept constantly in this house, may rest on two rows of shelves, one at the floor, the other three feet high. The entrances, of course, pass through the wall. An alighting-board, so hinged as to be let down in summer but tightly closed over the entrance during very severe winter weather, would be very desirable. Between the double windows—which, it will be remembered, shut closely against rubber—sacks of chaff may be placed in winter, if found necessary to keep the proper temperature. With few colonies this might be very necessary. The adjacent entrances should vary in color, so that young queens would not go astray when they returned from their "marriage flight." Somewhere in the walls there should be a ventilating tube—a brick flue would be very good—which should open into the room just above the floor. Ventilators such as are so common on barns might be used. The pipe for admitting air should pass through the ground and enter the floor from below. A good cellar well ventilated and thoroughly dry will be convenient, and should not be neglected.

Are they desirable?

That the early use of these houses has met with so much favor, seems to argue that with more experience and greater perfection they may become popular. The desirable points in the case, as it now stands, are: First, the bees are in condition to winter with no trouble or anxiety. Second, they are handled in the house, and as they fly at once to the windows, where they can be suffered to escape, they are very easily and safely handled, even with little or no protection. Third, as we can extract, manipulate honey boxes, etc., right in the same house, it is desirable on the score of convenience. Fourth, as the bees are protected from the sudden rise of the out-door temperature, they will be kept from frequent flights during the cold, forbidding days of the fall, winter and spring, and will thus be more secure against spring dwindling. Fifth, as they are so independent of out-door heat, because of the thick walls, with intervening air-spaces, the bees are found less inclined to swarm. Sixth, the house can be locked and one will know that thieves cannot steal the hard-earned property.

The objections to them are: First, the bees leave the hives while being handled, crawl about the house, from which it is difficult to dislodge them, especially the young bees. This objection may disappear with improved houses and practice. Second, in very severe

winters they may not offer sufficient protection, yet they would be much safer than chaff hives, as there would be many colonies all mutually helping each other to maintain the requisite temperature, and the walls might be even thicker than specified above, without any serious inconvenience. Third, some think it pleasanter and more desirable to handle bees out-of-doors, where they are unconfined. Fourth, the cost of the house; yet this is incurred only for once in a life-time, and saves providing shade, sawdust, packing-boxes, complex hives, etc. I predict that these structures will grow more and more into favor. J. G. BINGHAM.

Cort. Co., N. Y.

Miscellaneous.

WHAT OTHERS SAY.

FROM a prize essay delivered by Samuel Parsons before the Mass. Horticultural Society, we copy a few paragraphs. We would gladly present the excellent essay entire did our space permit:

THE JAPAN MAPLES.—They have been exhibited and sold in Europe, in a limited way, for at least fifteen years, but, strange to say, in face of the simple facts, there has existed a widespread conviction that their hardiness is defective. Hence we read of them as pot-grown, a condition that must always prevent the full, free development of their beauty. Some one must have finally, and perhaps accidentally, left them unprotected in the open ground during winter, for we may now find them growing in the most exposed positions, apparently as hardy as any Maple. The only weakness of which they now continue to be accused, is a tendency to burn and fade under the stress of exceptionally hot summer days.

LET us look at a few of the varieties that may strike us as specially noteworthy. First, and perhaps most popular, comes Acer polymorphum sanguineum. Its main attraction is the solid, rich red, or purple that dyes the leaf, otherwise it is simply solid and vigorous for an extremely dwarf tree. The Sanguineum variety performs very much the same ornamental part among shrubs as the Purple Beech does among trees, with less shining lustre and more richness of hue. Surely I could not give it higher praise. In mentioning these varieties of Japanese Maple, I must not forget the original species, Polymorphum, which grows better than many of its varieties, and is only less exquisite than the best of its offsprings. Indeed, though the prevailing color of its leaves is green, it often throws out sports of pink, yellow and white, thus illustrating afresh its erratic tendency, that tendency which has enabled Japanese cultivators to display their horticultural ingenuity in perpetuating so many attractive varieties by skillful grafting.

MAGNOLIAS.—Magnolia Halleana or stellata, is the most compact and slow-growing of its race. It has been introduced from Japan for many years, but has not until recently been received with anything like the attention it deserves. The leaves are dark-green, somewhat small for a Magnolia, and given to disposing themselves in very picturesque masses. If it is the most dwarf of Asiatic Magnolias, it is also the hardiest and most readily transplanted. Its prime charm consists in its flowers. They are more than creamy white, they are snow-white, with a peculiar brilliance of texture; but, more than all, they are delicately fragrant.

THE SUN-RAY PINE.—But the Pinus Massoniana *par excellence* is the golden-leaved form of that species. It is bright gold, that seems to gain a touch of deeper gold as you pause to look at it. This peculiar effect is greatly enhanced by the fact that Pinus Massoniana has two leaves only in a sheath, and these leaves are so clustered on the end of the branches as to spread in every direction. It was this peculiarity that gave rise to the name Sun-ray Pine. But the noteworthy habit of this Pine is its late variegation. In June, while in full growth, it is rather greenish-golden than golden, but all through the summer its yellow grows brighter, until, in September, it makes a very striking object amid the fading leaves of fall.

OIL PASTE SHOE-BLACKING.—As the Scientific News remarks, any one may make his his own oil-paste blacking if he cares to take the trouble. The following is a trustworthy recipe for the purpose:—

Molasses	1 lb.
Ivory black	1¼ lb.
Sweet oil	2 oz.

Rub together in a Wedgwood mortar till all the ingredients form a perfectly smooth homogeneous mixture; then add a little lemon juice or strong vinegar, say the juice of one lemon, or about a wine-glass of strong vinegar, and thoroughly incorporate, with just enough water, added slowly, to gain the required consistency.—Journal of Chemistry.

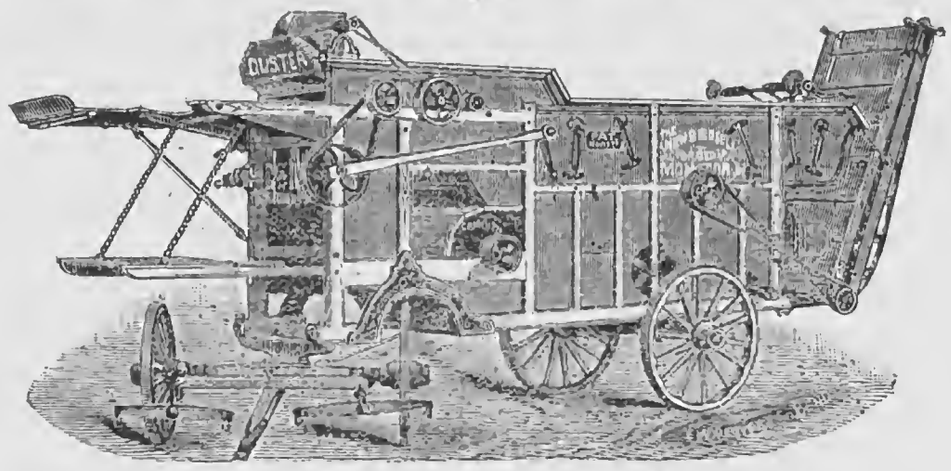
WAR AND TAXATION.—"Every war, even a victorious war, is a national calamity." So writes the Count Von Moltke, Germany's most successful warrior. Last year Europe expended for military and naval purposes something near $800,000,000, and did no fighting. This great burden was borne chiefly by eight Powers, as follows: "Russia, $173,740,000; Great Britain $153,510,000; France, $128,520,000; Germany, $101,626,000; Austro-Hungary, $53,074,000; Italy, $44,030,000; Spain, $28,560,000; Turkey, $23,800,000. This profitless squandering of money—which the over-taxed producers have to furnish—is unfortunately not the whole of the blood tax upon Europe in times of peace. The national debts of Europe, due almost entirely to past wars and preparations for future conflicts, amount to more than twenty billion dollars, the interest of which the producers have to meet. About eighteen billions of debt stand against the eight Powers above named.

To this frightful extent Europe is handicapped in the race for industrial supremacy. It is the penalty which the people have to pay for the accidents of their geographical position, the forms of government they have inherited, and their worse inheritance of military history, national hatreds, and political entanglements.—Scientific American.

PLANTS AND THE ELECTRIC LIGHT.—A good deal has been said by some of the London horticultural journals respecting the practical application of the ELECTRIC LIGHT for forcing purposes. It now appears that the growth of plants is proved to take place under the influence of the electric light, and although matters are still in their infancy, enough has been definitely gained to show that, in the future at least, the English, if not American gardener may be able to avail himself with advantage of the electric light, and ultimately set the dark, foggy days of winter at defiance as he does already their low temperature. It was already known in a vague sort of way that the action of the electric light on vegetation was similar to that of the solar ray; but practical proof, such as would carry conviction to the unscientific mind, was wanting. This has now been afforded, and to Dr. Siemens, as we learn from the Gardener's Chronicle of London, is due the credit of being the first to place the matter on a practical basis. At a late meeting of the Royal Society, Dr. Siemens gave orally an account of his preliminary experiments, and exhibited illustrations of the power of this new agent in promoting vegetable growth. The method pursued was to plant quick-growing plants and seeds, such as mustard, carrots, beans, cucumbers and melons, in pots, and these pots were divided into four series, one of which was kept entirely in the dark, one was exposed to the influence of the electric light only, one to the influence of day-light only, and one to day-light and electric light in succession. The electric light was applied for six hours each evening—from five to eleven—and the plants were then left in darkness during the remainder of the night. The general result was that the plants kept entirely in the dark soon died; those exposed to the electric light only or to sunlight only throve about equally; and those exposed to solar light first, and then to electric light after sunset, throve far better than either, the specimens of mustard and of carrots exhibited to the Society showing this difference in a very remarkable way.

THE ELECTRIC MIDDLINGS PURIFIER.—A public exhibition was given in New Haven, March 13, of the electric middlings purifier, the joint invention of two young men of that city. The working of the device is said to have been highly promising. Over the wire bolting cloths is placed a bank of hard rubber cylinders, which are slowly revolved against strips of sheep skin and thus electrified. To these rollers the light bran is attracted, to be mechanically brushed into a proper receptacle. This substitution of electric attraction for the blast in separating bran from flour is said to lessen the waste, while it obviates the necessity of doing the work in a closed chamber and the risk of explosions. The exhibition was made in an open room, and there was neither dust nor waste.

THE RAILROAD lobby is the most powerful, dexterous and best supplied of all lobbies, and no bill restricting the roads or adverse to their interests has any chance of success unless it is clearly right and is urgently demanded by



THE BIRDSELL MONITOR JR. COMBINED CLOVER SEPARATOR.—FIG. 126.

the great body of the people. The unjust favoritism of secret special rates must be abolished.—So says the N. Y. Herald; so say we all.

THE New Hampshire Mirror and Farmer says that an extensive breeder of Angora goats in Texas considers it a much more profitable business than sheep-raising. This person owns 1,119 goats. It costs $1,000 per annum to provide for them, and his profits last year he estimates at $2,000. The meat is claimed to be better than mutton, and each goat yields about two pounds of hair annually, which is worth 55 cents per pound in this country and 75 cents in England.

SPRING HAS COME.—Go and commune with nature and be chased by the taurine quadruped; go walk in the aromatic fields and valleys where the hornet buzzes like a book-agent and yearns for an opportunity to imbue the small boy with its cimeter. Go along the railroad beside which idle breezes osculate and dally with the telegraph wires, and behold the number of quack medicines, everyone of which is the best, and you will be quite well aware that spring is here. Just gaze upon the Dandelion whose golden heart is wreathed in a snowy aureole; just gaze upon the Violet which offers a tempting banquet to the honey-bee; just gaze upon the lambkin that gambols playfully over the balmy lawn; and then look at the suits of clothes for eight dollars apiece, and the landlady cleaning house, and removing tacks from the floor with her husband's best razor. Then listen to last month's chicken trying to evolute its pule into a respectable crow; then notice how the landlord doesn't keep his word about having the wall re-papered, and the kitchen faucets fixed so that they won't divulge their contents unsolicited, and you will be twice positive—if possible—that spring is at hand.

If you happen to be matter-of-fact, and can't distinguish the poetic affinities and attributes of things, and still imagine that spring is not here, why then there is only one way for you to find out positively, and that is very simple—look at the almanac.—Thoughts and Events.

FORCIBLY PUT.—We find the following in the Evening Post: "Poisoning the wells is regarded as an extreme act of human atrocity; but although in almost all wars of any magnitude and duration the act or the intent to commit it is charged upon 'the enemy,' there has seldom been any trustworthy evidence in support of the accusation. Is poisoning the milk much less atrocious? Next to water there is no article more widely used, or used more unsuspectingly. When the adulteration is effectual and fatal, the principal sufferers from it are members of an innocent and helpless class—little children, who are spared in war as non-combatants, but who are easiest and oftenest the victims of those destroyers in time of peace, the venders of diseased milk."

PLOWING MATCHES are excellent things, says the London Farmer. They foster in the teamster a love of performing good honest work. A straight, clean, well-cut furrow is pleasant to look at, and any project which tends to promote good plowing is deserving of support.

MR. R. J. BLACK, OF BREMEN, Fairfield Co., Ohio gives prominence in his catalogue to the following apples:

CELESTIA. From seed gathered in North Carolina by Dr. Mote. Dr. John A. Warder says of it: "It combines so many excellencies that it will be hard to find its compeer." He describes it as follows:—Core small, oval, open, clasping; seeds numerous, long, angular; flesh yellow, very fine-grained, very tender, juicy; flavor sub-acid, very sprightly and spicy, aromatic, delicious; quality, very best; use, table and kitchen; season, September [near Cincinnati],—Warder's American Pomology, page 531.

STUART'S GOLDEN. See RURAL NEW-YORKER for July 22, '79, for Mr. Charles Downing's description, also engraving from specimen sent by Mr. Downing.

MOTE'S SWEET.—Dr. Warder says:—"One of the most delicious sweet apples. Origin the same as that of Celestia.

CATALOGUES, ETC., RECEIVED.

CATALOGUE OF FOREST TREES OF NORTH AMERICA, by Prof. Charles S. Sargent, of Harvard University. This catalogue is published with a view to facilitate the collection of information regarding our forest trees, in connection with the 10th census of the United States.

THE AMERICAN STANDARD OF EXCELLENCE, revised by the American Poultry Association at their annual meetings, including the changes made at their annual meeting at Buffalo, February, 1879. This handsomely gotten up work of 243 pages, gilt-edged, morocco-bound and printed on tinted paper, is an elegant specimen of editorial supervision and typographical art. In it is a complete description of all the recognized varieties of fowls, and it should, therefore, be in the hands or on the book-shelves not only of every poultry fancier, but of all lovers of domesticated fowls. Geo. S. Joselyn, Fredonia, N, Y., Sec'y and Treas. A. P. A.

HOLSTEIN HERD BOOK, VOL. 4. In this volume are registered 208 bulls of this fine breed, 68 of which are imported animals, and 577 cows, of which 365 are imported. As we have had frequent occasion to remark this breed of late years has been gaining rapidly in popularity, not only in the recognized dairy districts, but all over the country.

CATALOGUE OF CIDER AND WINE PRESSES sold by Boomer & Boschert, Syracuse, N. Y.

Industrial Implements.

THE BIRDSELL MONITOR JR. CLOVER SEPARATOR.

TWENTY-FIVE years ago John C. Birdsell invented the Monitor Clover Separator, which he continued personally to manufacture until 1870, when the rapidly growing demand for his machines necessitated the organization of the Birdsell Manufacturing Company, of South Bend, Indiana, so that by enlarging the works the great demand might be promptly supplied. Of the present workshops the main building, 80x166 feet, and five stories high, is devoted exclusively to the manufacture of separators. The popularity of these among thrashermen everywhere, is amply shown by the fact that over 8,000 of them are now in use throughout the country. The late adaptation of steam to thrashing machinery, however, called for a separator that would do the work much more rapidly. Even with Mr. Birdsell's quarter of a century's experience in that particular line, it required a considerable number of experiments before just the right improvements could be made upon the "old reliable" Monitor to adapt it to the new requirements.

The most efficient changes, however, were at length discovered, and these were all embodied in the Monitor Jr. Combined Clover Separator. In its construction the makers have adhered closely to the main principles which made the old Monitor deservedly a favorite, departing from them only in form and other unessential details, in which the changes made are conducive to greater efficiency under the new requirements. The Monitor Jr. differs from the old Monitor in the following particulars:—The thrasher cylinder runs under-shot instead of over-shot, hence no thrasher feed roller is necessary, while it is enabled to thrash much faster, as the hulling and separating capacity has been increased about one-third; instead of the long raddle belt that conveyed chaff and seed to the huller in the old machine, that office is more efficiently done by a vibrating floor in the new; as seen in the accompanying cut, the sides of the machine are made tight, an arrangement which, with the addition of the Duster devised by the same firm, practically saves the operators from the annoyance of dust; the size of the pulleys has been enlarged, thus greatly increasing the friction, and lessening the strain. Several minor alterations have also been made, all in the line of greater efficiency. Great as has been the popularity of the old Monitor, one ventures little in prophesying that that of its youthful competitor will be still greater, a good fortune already presaged by the large sales of it made since its introduction to the public. We would advise all who are interested in machinery of this kind to send for prices and full particulars to the above address, and also for THE CLOVER LEAF, a well edited and instructive periodical mailed free to all farmers whose names are forwarded to this enterprising Company.

Everywhere.

RURAL SPECIAL REPORTS.

COL., Canon City, Fremont Co., April 6.—We sow but very little fall wheat in this section. I know of but one person in this county that makes a practice of sowing fall wheat, and his is not ready to harvest more than a week before that sowed in the spring, and the yield per acre is no more than that of spring wheat, neither does it make any better flour. We are not troubled with Hessian fly in this country at present, nor with anything injurious to wheat, except grasshoppers. The acreage in wheat, I think, is less this year than it has been for several seasons in this county. I don't know as to other counties. The crop sowed here is chiefly oats, and there will be a greater acreage under it this year than for several previous ones. J. G.

IDAHO, Bois City, Ada Co.; April 10.—The wheat crop bids fair to equal that of previous years. Acreage about the same as last season. Our farmers here know nothing of any wheat disease. They put in their crops and count with a certainty upon a good harvest. Nothing is raised here without irrigation. No insects have troubled us as yet. L. F. C.

ILL., Hoyleton, Washington Co., April 6.—This part of Southern Illinois is known as Egypt—a very appropriate name I often think, so far as the mummified character of the old settlers is concerned The land, however, is rapidly changing hands and becoming the property of a more wide-awake and industrious people. In this section it is owned chiefly by Germans, and they display an energy, industry and true knowledge of farming that would be a credit to any people. Three-fourths of my neighbors are Teutonic, and they still maintain a great deal of the manners and customs of the Fatherland, especially in their churches, schools and marriages. They know how to raise wheat, and fully three-fourths of their arable land is under it, and the prospects for a fine crop are good. Late-sown wheat, however, is damaged a great deal by frost and heaving, and last fall the Hessian fly destroyed some fields entirely. The outlook now, however, is favorable, and there has been a large increase of acreage. During the winter we had a great deal of rain, and very little hard freezing—hence a good deal of mud; even now our roads are nearly impassable. Spring work will therefore be late; our plows are still in winter-quarters, but a few days of drying weather will fetch them out. Fruit prospects are flattering. Wheat is now selling at $1.20; corn, 25c.; oats, 25c.; potatoes, 40c. A good deal of land changed hands this winter at an average price of $25 to $30 per acre. The buyers are all Germans; the sellers, Americans who are going West. All tillable land hereabouts is now occupied. M. S.

IOWA, Oskaloosa, Mahaska Co., April 10.—We had a moderate winter, with very little rain and no snow. Quite a large breadth of winter wheat was sowed last fall; but it is almost or wholly a failure. The weather is quite dry at present with frosty nights. At this rate grass and the spring wheat will suffer. People generally have sowed spring wheat on their winter-wheat ground. This county has an abundance of coal and timber, which renders it quite a desirable place to live in. It is, too, an excellent grain and stock county. Cattle are just beginning to roam around and pick up a little grass, which, in its present condition, is not of very much benefit to them. A. B.

KANSAS, El Dorado, Butler Co., April 6.—We had a splendid winter. With one exception it has been too dry for winter wheat. Peaches will not be over half a crop on account of the warm weather in January, which caused the fruit buds to swell so that the cold weather we had on the 12th and 13th of March killed about half of them. All other fruits are safe yet, and the indications are fair for a good crop. We had quite a heavy rain on the afternoon and night of March 26th, which was needed very much. Corn is worth 20 cts.; oats, 40 cts.; wheat, 80 cts.; flax seed, $1.75; millet, 75 cts.; potatoes, $1.25; butter, 17@20 cts.; eggs, 8@10 cts.; cattle, $3@4; hogs, $3.60; hay, $3 per ton. L. K. W.

KANS., Freedom, Butler Co., April 6.—Peach trees are in bloom; but the crop will be small; mostly on seedlings; budded fruit is nearly all killed. We generally have ripe peaches from June 15 to Oct. 20. W. J. B.

MICH., Dansville, Ingham Co.—We had no snow the past winter to amount to much. It was almost like summer. Winter wheat is looking first-rate around here, though some pieces have been heaved out and the roots lie bare. It is the same with clover fields. Wheat is worth $1 per bushel; oats 30c. per bushel; potatoes 30c. per bushel; eggs 9c. per doz.; butter, 25c. per pound. O. G.

N. Y., Corning, Steuben Co., April 8.—The past winter was a very mild and pleasant one; but little real cold weather and but very little snow—most of the time the ground was bare and plowing was done at intervals of a few weeks, all winter long. Owing to the open season but little ice has been gathered. Notwithstanding the scarcity of hay at the opening of winter, there will probably be a considerable quantity carried through the summer. Stock were sold off last fall, so as to greatly reduce the number, and at very low prices, on account of the short crop of hay; but the winter has been so mild that far less fodder has been required than if it had been as cold as usual. On referring to my diary, I find that robins and blue-birds have come one month earlier than last year; $10 at the barn, or $12 delivered, seems to be about the price paid for hay now. The roads have been bad most of the time since last fall. F. H. D.

TEXAS, Clarendon, Donley Co., April 6.—There is no wheat grown in this county for two reasons:—We can't make flour of it, for there's not a mill of any sort in the county, and, again, we can't sell it, for it's 170 miles to the next railroad at Fort Dodge, and 220 to the road at Fort Worth. What little farming is done here is confined to raising corn, which sells readily to stockmen at $1 per bushel; but last season scarcely any was raised on account of dry weather. The past winter was very open and also very dry—no rain since November until 10 days ago, and then just enough to wet the ground for plowing. That Pearl Millet the RURAL sent me last year acted splendidly. When five feet high and heading out I cut it, and it grew to the hight of four feet again, headed out and ripened its seed. It was greedily eaten by all kinds of stock. G. H.

TEXAS, Salado, Bell Co., April 5.—We have lately had a very hard freeze. Corn planted and up was all killed; all is now replanted and coming on. On the 1st we had the finest rain of the season. All small grain is looking fine, and the promise of a heavy crop of wheat, oats, etc., is good, but we raise no grain for export, all being consumed in this or adjoining counties. The amount of the old crop on hand is small, but sufficient to carry us to the harvest of new—now only six weeks off. We have a fine merchant mill at Belton, and our Salado River has five mills in less than ten miles, which most of the year run night and day. E. G. M.

VT., North Bennington, Bennington Co., April 6.—On a section extending from the mountains, in southern Vermont, forty miles to the Hudson and as far from north to south, I think it will require great research to find ten acres of wheat. I do not know or hear of a kernel being sown last fall. The grandfathers, now gone, used to tell what crops of wheat their fathers raised. It has been grown at spasmodic intervals, in various parts since I can remember—about forty years. But to grow wheat profitably, even for home use, on these old lands where only isolated acres seem adapted to it, more knowledge must be had. Some say it does not pay to raise wheat, because when it is carried to the mill, they get poor flour and little of it. E. N. D.

VA., Newmarket, Shenandoah Co., April 12.—Winter here was exceedingly mild up to 1st of February; for a week or so we had snow and cold, then mild until 1st of March when we had a good deal of cold rains, winds, etc., nearly throughout the whole month. April, so far, has been somewhat blustery, with a few very fine growing days. Wheat, of which a large acreage is sown, is looking exceedingly well for the time of year, in this section, except a few small spots hurt by the drought last fall. In the adjoining county, Page, wheat is badly eaten by the fly. We have had some severe frosts the last week, which, it is feared, have injured the fruit crop to some extent. Peaches have been in bloom for three or four weeks; Plums, Cherries and Apples are blossoming now. Farmers have generally finished sowing oats, and are preparing to plant corn. Peas, radishes, lettuce, onions, etc., have been up for several weeks and are growing finely; prices for produce are, wheat, $1 15@1.16; corn, 50@60c.; oats, 40c.; rye, 60c.; butter, 20c.; eggs, 8c.; potatoes, 50@60c.; springs and wells that were low and some dry last fall have filled up now and water is plentiful everywhere here. O. S. W.

VA., Princess Anne Co. Apr. 8—We are having winter by spells—a few days since strawberries were making nicely, and to-day looks as if it might snow. We cut our first asparagus on the 5th. We plant quite a quantity of the black peas among corn, pick a part and turn hogs in on the remainder to fatten, finishing on corn. They will not do for hens—they stop their laying. A great deal of fish and crabs are used here for manure. M. S. M.

VIRGINIA, Norfolk, Norfolk Co., April 9.—On the 24th of March a hard freeze here killed all the strawberries and peaches that were in bloom and injured "truck" generally. We have not much hopes of a good peach crop in this section, as most of the trees were in blossom before the late frost. Apples, pears and cherries, however, are safe. J. L. B.

WIS, Chilton, Calumet Co., April 9.—We have had a very mild and open winter, and are having a wet, backward spring. Winter wheat, of which this county sowed an unusually large acreage last fall, has suffered more or less, but from an examination of quite a number of pieces, I am convinced that people are more scared than necessary, and that nearly, if not quite, a full crop will be harvested. The kind sown has been almost universally the Clawson. Spring wheat is worth $1.10 to $1.15; corn, 50c.; oats, 40c; potatoes, 40c. to 60c.; butter, 25c.; eggs, 10c.; hay, $12. G. G. C.

WIS., Edson, Chippewa Co., April 8—Wheat looks well—better than last year. It has not been winter-killed to any great extent, and does not show any signs of any disease as yet, or of harm from the Hessian fly. I think that its general appearance is better than last year at this time, and quite as good as the average of previous years. The acreage is about the same as last year. J. O. B.

WIS., East Troy, Walworth Co., April 8—Winter wheat is starting finely; clover is mostly killed. We have commenced sowing spring wheat. F.

The Querist.

ANSWERS TO CORRESPONDENTS.

Etc., Etc., Etc.

J. T. F., South Onandaga, N. Y., asks, 1, whether the following rule for determining the weight of live cattle by measuring them is correct:—Measure in inches, the girth around the breast just behind the shoulder blade, and the length of the back from the tail to the fore part of the shoulder blade; multiply the girth by the length and divide by 144. If the girth is less than three feet, multiply the quotient by 11; if between three and five, by 15; if between seven and nine, by 31. If the animal is lean deduct one-twentieth. Or, second, take the girth and length in feet; multiply the square of the girth by the length, and multiply the product by 8 36. Live weight multiplied by .605, gives net weight nearly. 2, Which are the more durable—split or round posts, and what is the probable respective durability of the following kinds of timber—locust, red and white cedar, chestnut, oak, elm, red beech, white and black ash, and black-walnut. 3. What quantity of oats should be sowed or drilled in one acre. 4, Is there anything in which seed corn can be soaked or with which it can be mixed, that will prevent crows and grubs from eating it, and at the same time act as a fertilizer. 5, Name the best books in geology, with the price; 6, also the best on law and the price; 7, the best on physiology, and the price.

ANS.—1, All these rules are based on some rough method of finding the cubic contents of the carcass. The second rule will work more nearly than the first, but it is only an approximation after all, because cattle differ greatly in quality and solidity of frame, and a gaunt, bony animal with much offal will yield much less than a well-bred, compact one. These rules are therefore to be used with variations and allowances founded upon experience. 2, Round posts are more durable than split ones, when the bark is stripped off. The timbers mentioned may be classed as to durability very much in the order given. Chestnut is preferable to white cedar. 3. Two-and-a-half bushels per acre. 4, Soak corn in hot water in which some pine tar has been stirred. A thin coating of the tar envelopes each grain and serves to disgust the crows. There is no necessity to steep seed in any fertilizer. If that is put into the soil, it will be placed where it will do the most good. 5, The Elements of Geology by Loomis is a small, cheap work. Lyell's, and Dana's works are more costly standard works. 6, Waits's "Every Man his Own Lawyer," is a useful book for reference; but law is a sharp-edged tool which no one should play with; it is better to pay a moderate fee to a lawyer for advice than to be one's own lawyer. The adage runs, "A man who is his own lawyer has a fool for his client." 7, Dalton's is an excellent work. The prices can be obtained by inquiry at the next book store. We would remind our friend that this department is meant for the use of *all* our subscribers, so that no one of them should make so many inquiries at once that full answers to them would occupy all our space to the delay of answers to other inquirers. Three or four queries are quite enough at one time; if more are sent the answers are necessarily cut short: but one can come again. Then again, never send all the way to New York to ask a question which can be easily answered in the neighboring village.

An Impotent Young Bull.

R. G., Lewisville, O., has a Short-horn bull, two and a half years old, that has failed of late to get any calves and a cause for his impotency and a remedy are asked. He has outdoor exercise every day; is fed corn and oats mixed; also corn fodder and hay; he has not been run very hard and has been permitted to serve cows only once.

ANS.—There are so many things that may cause impotence in a bull, it is almost impossible to prescribe a remedy without seeing the animal. Your bull may have received an external injury, as they are liable to by jumping a fence, butting against some hard substances, or trying to overturn some heavy object, or by fighting. If nothing of this kind has happened to him, he may have been over-fed at times with corn or other food. We would suggest feeding him nothing for a few weeks but hay, and letting him have a roomy yard for exercise in all good weather, both during the day and night; if you have sufficient pasture, turn him out to this, if well fenced. See that he has plenty of pure water at all times to drink, and give him a heaping tablespoonful of salt every day, if he will take so much, and the same quantity of sulphur once a week. After dieting thus for a few weeks, give him with his grass or hay, two quarts of oats and two quarts of wheat bran every night and morning, with a pint of linseed meal if you have it; if not, then a pint of whole flax-seed mixed with the oats and bran. After a week or two of this feed, let him be tried to a cow of a size he can easily cover. Medicine of any kind is rarely of any benefit to an impotent animal; a judicious diet is the best thing.

Analysis of the Sweet Potato.

P. C. S., Hurlock, Md., asks for a full analysis of the sweet potato.

ANS.—The following is the analysis of this potato given by the North Carolina Experiment Station. We give also that of the Irish potato:

	Sweet potato.	Irish potato.
Water	73.39	75.00
Albuminoids	1 28	2.11
Starch	15.06	17 32
Gum, pectine, etc	1 08	2.70
Glucose (sugar)	6.86	....
Cellulose (fiber)	0.98	1.65
Fat and wax	0.26	0.30
Ash	1 07	0.92
	100.00	100.00

The great distinction between them is the glucose in the sweet potato. The sweet potato in this particular analysis appears to have less water, but perhaps in a greater number of analyses this would not appear. The sweet potato must be extremely valuable as a fattening food. Dr. Ledoux estimates a good crop at 450 bushels to the acre; but if we should estimate them at only 300 bushels per acre, and corn at 40 bushels, the sweet potato would yield two and a half times as much dry food per acre as corn.

The Cattle Gad Fly.

H. S., Easton, Md., sends some specimens of worms taken from the backs of a couple of Jersey heifers. They were found just under the skin, and were easily pinched out with the thumb and finger, and he asks for some information about them.

ANS.—These are the larvæ of the cattle gad fly—œstrus bovis. This fly is much like the horse botfly and belongs to the same family. It lays eggs in the skin along the backs of cattle in August, and the larvæ remain in the flesh and feed upon the pus caused by the irritation until May, when they wriggle out, enter the ground, pupate and emerge as mature flies in the summer. They do no particular harm except to cause some irritation, and worry the cattle. The only preventive is to keep the cattle up at the season when the eggs are deposited—this, however, is impracticable. The worms—so-called "warbles"—are so common as to occasion special regulations concerning wormy hides by tanners' associations; and as we never hear of an animal suffering from them, they are among those minor inflictions which it pays better to submit to than to fight against. They may, however, be easily dislodged by pressing with the finger and thumb as above stated.

The Bartlett and Clapp's Favorite Pears.

Verdant Inquirer, East Deering, Me., says that he is told by an old nurseryman that there is this difference in the Bartlett and Clapp's Favorite Pears—that in a locality where one will thrive, the other will not. For instance, on the east side of a high hill in his town one thrives finely and the other fails—the tree cracks badly; while on the west side of the hill, the case is exactly reversed. The Bartlett is at home on the east side of the range and a failure on the west side; while the Clapp's Favorite is a success on the west, but a failure on the east side, and our correspondent asks the cause of such a phenomenon.

ANS.—Such differences exist. We can not say, in the case here mentioned, why it is so. Generally speaking, it may be said that those kinds which push buds the earliest in the spring are less liable to injury if growing in situations which retard their spring growth.

Sowing Salt and Plaster, etc.

O S. B., Burdell, N. Y., says he thinks barley does best broadcasted; on it he wants to sow salt and plaster—a bushel of each per acre—and having no drill, he asks whether the best results can be got by broadcasting them. It is said thereabouts that commercial phosphates do not do any good on gravelly lands—oak, chestnut, walnut, ash and hickory land; and he asks what is the reason for their failure.

ANS.—Barley and all other small grains do best when drilled. The plaster and salt should be sown broadcast, being heavy, and if sown on a damp day, they may be spread very evenly. The reason why phosphates fail on your soil is explained in an article on the behavior of phosphates by Professor Caldwell, March 27, page 200. Probably if you were to increase the application, the effect would be more apparent.

About Fall Wheat.

D. B. C., Mt. Union, Ia., asks what kinds of fall wheat are hardiest, and what is the best way of preparing the soil to lessen the risks of winter-killing.

ANS.—So far the hardiest fall wheats are the Clawson, Fultz, Treadwell and red Mediterranean. The red varieties are hardier than the white. But the preparation of the soil and the manner of sowing have much to do with the resistance of the crop to the winter. A loose surface and a compact bottom make the best seed-bed and the seed should be put three inches underground by a drill.

Roots for milch cows.

F. N. G., Olean, N. Y., asks what kind of roots is the best for milch cows whose milk is sold in town—some sort that does not flavor the milk.

ANS.—There is nothing better than the Yellow Globe Kinver mangel for milch cows. They give no ill flavor, but produce rich full-flavored milk. For a change, which cows appreciate, a quantity of Lane's sugar beet might be sown. These also make good milk and much of it.

Moss on Meadows.

C. H. G., Glenville, N. Y., asks, 1, the cause moss on meadows and a remedy therefor; 2, which is the best commercial fertilizer for a loamy soil.

ANS.—1. Moss grows on meadows because the soil is too poor to produce grass. To get rid of it, harrow up the mossy spots, seed them down again, and either spread manure on them or some artificial fertilizer prepared specially for grass. For "special" fertilizers consult our advertising columns.

"Foundered" Sheep.

W. G., De Witt, Neb., asks whether there is any remedy for foundered sheep.

ANS.—More particular information regarding the sheep should have been sent. How are they foundered? It is, most probably, something else than "founder" so-called; describe the symptoms and we will advise you. As a temporary expedient, give the sheep a dose or two of one ounce of linseed oil, which will relieve the bowels and cool the system.

Miscellaneous.

B. S., Memphis, Mich., asks, 1, the difference between Alsike clover and Alfalfa; 2, which is the better for sandy soil; 3, how to get potatoes to form a second crop.

ANS.—1. Botanically the two plants belong to the same family (Leguminosæ), but they differ in being members of different genera. Alsike clover (Trifolium hybridum) is a native of Sweden, and has derived its common name from a parish in that country named Alsike. Alfalfa, or Lucern (Medicago sativa), originally came from Asia; but it has long been in cultivation both in North and South America. As fodder plants both are considered excellent. An analysis of each shows the Alsike clover to contain: water, 82.0; organic matter, 16.2; ash, 1.8: albuminoids, 3.3; carbohydrates, 6.3; crude fiber, 6.6; fat, 0.6; and Alfalfa in about the same stage of development contains, water, 74.0; organic matter, 24.0; ash, 2.0; albuminoids, 4.5; carbohydrates, 7.0; crude fiber, 12.5; fat, 0.7. This indicates that Alfalfa contains a somewhat greater proportion of nutritive matter than the clover. 2. Neither of them is suited for very light soil, both preferring a rich, loamy soil, and the Alfalfa must, in addition, have a deep, mellow subsoil. For your latitude the Alsike clover will probably prove most successful. 3. Early potatoes sometimes form new tubers a second time in the same season; but this second crop is worthless, or nearly so. The potato yield may, however, be materially increased by layering the tops, as described in our potato number of Oct. 18th 1879. When the earliest tubers are nearly full-grown, bend the tops over and cover them with soil all but four or five inches of the tips; if the season is not too dry the stems will form new tubers.

H. T., Wolf Date, Ia., asks, 1, what kind of grass seed should he sow in groves in which the trees stand from four to eight feet apart, and are three years old. 2 He lost 50 hogs the past winter from a cough and he asks what remedy should be applied; 3, would a cross of a Poland China sow with an Essex boar be advisable for early maturity; 4, what is the RURAL'S own opinion of the merits of cob meal as food for hogs and horses.

ANS.—Sow orchard grass, wood meadow grass, (Poa nemoralis) and Kentucky blue grass; these all thrive under shade: about seven to ten pounds of seed of each are sufficient. 2. Cough is caused as much by indigestion as by lung disease. You should make a post-mortem examination by which your judgement would be guided as to the seat of the disorder, and then consult Coburn's Swine Husbandry for advice. 3. A cross of the two breeds (an Essex boar to be used) would improve the progeny as to early maturity. 4. Every now and then some one discovers that corn cobs are very nutritious. We don't believe it. Some persons eat bread with saw-dust in it, and find it acceptable, but only because they must fill their stomachs and have nothing else. Cobs contain some sharp, scaly fragments which cannot be ground fine, and cause serious irritation to the intestines of horses and pigs. Cob meal may do for cattle, but we think not for horses or even pigs. More favorable experiments than have yet been made, will be needed to change our opinion.

C. F. R., Tonawanda, N. Y., asks, 1, when is the best time to plow sod for corn; 2, which kinds of grass make the best lawn, and how much seed to the acre; 3, when should millet be sown as a main crop for hay; as clover did not "catch" last year, he is compelled to resort to millet this year.

ANS.—1, As near as possible to the planting time. If possible we should plow to-day and plant to-morrow. Corn loves a fresh, mellow soil with a decaying green sod to feed upon. 2, Lawns should be seeded thickly. Red top, 10 pounds; Kentucky blue grass, 6 pounds; creeping bent, 5 pounds; crested dog's-tail, 5 pounds; annual spear grass (Poa annua), 2 pounds, will be a sufficient quantity of seed and give a continuous verdure from early spring until winter. We shall have a lengthy illustrated article on lawn-making in the next issue. 3, Sow millet of any kind in June.

H. C. S., Easton, Md., says his chickens eat corn until their crops seems filled to the utmost capacity; but they droop and die; the droppings are white and yellow, and he asks what ails them.

ANS.—The trouble with your fowls is probably caused by weakness of digestion. Irregular or too steady corn feeding will produce such symptoms, also a want of broken bone and oyster shells to assist digestion. If the fowls are not supplied with these give them feed, or soft feed—wheat and corn meal scalded, with boiled potatoes. Add a little cayenne pepper and chopped onions; change their food occasionally. Oatmeal made into a stiff paste with cold water, or rice slightly boiled so as not to be sticky, is very good. So is, a little meat occasionally. Wheat, oats, buckwheat, etc., should be given rather than whole corn, which should be supplied but sparingly till their health is restored.

J. L. B., Norfolk, Va., asks for the experience of any of our readers with either of the following fruit evaporators: American, Zimmerman, Granger, Alden; and whether the fruit dried by either of them is better than that prepared in fruit houses.

A Subscriber, Chappell's Bridge, S. C., sends a bunch of blue, bulbous flowers, which are a troublesome weed on his farm; he wants to know the name, and how to get rid of them. Hogs will eat them greedily.

ANS.—The plant is Scilla Fraseri, also called Wild Hyacinth, and Quamash. It bears a raceme of beautiful blue flowers. Summer-fallowing the field with frequent and thorough use of the harrow, and throwing it open to a herd of swine ought to exterminate this beautiful but troublesome pest.

A. J. P., Johnston, N. Y., asks whether slaked lime is as good as land plaster to mix with hen manure, and whether the mixture is good for Strawberries.

ANS.—By no means. Lime mixed with hen manure will expel the nitrogen, the most valuable fertilizing ingredient of the manure; whereas land plaster "fixes" the nitrogen, and is therefore an excellent admixture. Hen manure and plaster form a good application for any garden crop.

TO SEVERAL INQUIRERS.—We do not give the addresses of contributors to the RURAL.... See our advertising columns for the name of a trustworthy commission merchant to whom goods can be sent for sale in this city.... Doubtless the reason why your queries have not been answered is that you have failed to send your address. . . The Evaporator of the American Drier Co., Chambersburg, Pa., is the best we are acquainted with. One of our staff has, as usual, personally examined the No. 2 Evaporator and strongly indorses the claims the company puts forth in its behalf.

Unimpeachable Testimony.

In Which Three-fifths of the People are Interested.

GENUINENESS, RELIABILITY, RESPONSIBILITY.

No Matter What Other Plan Has Failed, This Has Stood the Test of Time.

For Dr. Sykes has a Record of Ten Years, and that Record Stands Unparalleled.

READ WHAT THE PEOPLE SAY OF

"Dr. Sykes' Sure Cure for Catarrh."

C. P. TEMPLE, Coulterville, Pa., June 7, 1877, says: "I have used four packages of your remedy, and believe it is the only medicine in the market that is just what it is recommended to be—'*A Sure Cure.*'"

W. VILDA, Wilbur, Saline Co., Neb., April, 9 '77, says: "Your 'Sure Cure' *is all you claim for it.*"

E. A. CHILDS, Wrightstown, Wis., Dec. 23, 1879, says: "I thank the Lord I saw your advertisement. I was bad off with Catarrh, that had been dropping down on my lungs about a year. Your 'Sure Cure' arrested its course in about three days; it has far exceeded my expectation. I recommend it to all who are suffering with Catarrh or Lung Complaints. You can use this as a testimonial, for I can say *your 'Sure Cure' is rightly named, if a person only follows the directions.*

S. P. JEWETT, 20 River st., Chicago, April 3, '71: 'This certifies that on the 10th of January last, I tried Dr. Sykes' 'Sure Cure' for my Catarrh with such good results as to make me careless about getting more than one bottle. *It gave immediate relief and proved far superior to anything I had ever tried.* I cheerfully recommend it to a suffering public."

MR. A. BURTON, 290 W. Huron st., Chicago, May 17, '77, *reported the cure of his son*, a young man, by six bottles; bought six for himself, and I received information by one of his neighbors, who also became a patient, that *they cured the father* also.

W. G. JEAN, Portland, Oregon, Feb. 10, 1879, reports *a complete cure for Catarrh of twelve years*, and says: "There is nothing on this coast the equal of your Catarrh Remedy. Before I used your 'Sure Cure' my nerves were so shattered I could not write any," His letter now shows a bold, even, steady hand.

THOS. HOME, Richmond, Utah Ter., Jan, 22, 1880, says: "My brother *who was cured by your 'Sure Cure'* sends his best regards, and is thankful that such a man as you lives upon earth. He says he thinks that such men are inspired by the Almighty as an instrument in His hands in doing good to suffering humanity."

ALBIREUS ENGEL, Metamora, Ill.: "The three bottles of your 'Sure Cure' have done me more good than all the doctors and other medicines I ever tried, and *I feel like a new man.* I have a brother that used one bottle, and it helped him so much that he thinks he he is cured.

MRS. E. C. BRAINERD, Spring Green, Wis.: "I have used the bottle of 'Sure Cure,' and am thankful to report favorably. *My Lungs feel stronger and do not pain me so much.* The discharges from my head are not so bad, and my limbs are not so badly swollen. I was so weak I could hardly get about, but am getting stronger every day, and I have great faith, with God's blessing, in a cure. I like your Insufflator very much."

A. L. TOOMBS, Bloomfield, Iowa, aged 71, March 15, 1879, after using 7 packages 'Sure Cure' says: "When I commenced taking it I was severely troubled with Catarrh and Asthma, so that I could not rest day or night. I had not been taking it long until I saw that I was getting better, until I now feel that *I am almost cured of it.*"

MRS. M. A. BAIRD, Junction, Va., after using but one Package "Sure Cure" and ordering more, Oct. 25, 1879, says: "The 'Package' I have used did me a great amount of good. My head felt very badly from *such a roaring that I could scarcely hear any ordinary conversation, but it is now so much better that I seldom need ask to be told again.*"

REV. R. S. MARTIN, Crown Point, formerly of Hebron, Ind., Feb. 6, 1880, says: "Your 'Sure Cure' is the best remedy I have ever found for Catarrh, and quite a number of persons *have used it with success* on my recommendation."

REV. A. W. JEWETT of Joliet, Ill., Jan. 21, 1880, made the following verbal report: "Although I now find that I have used it but very imperfectly, I never tried anything before that did anywhere near the good your 'Sure Cure' has done."

DR. J. HOOVER, now of Oshkosh, Wis., wrote from Argos, Ind., June 14, 1879, as follows: "Your 'Sure Cure' helped me more than anything and everything I ever used, and I believe it will entirely cure me." He reported the cure afterward, then bought the 'Sure Cure' for his patients, and the following quotations from his letters are fair samples of his further reports: "Mrs. Lowrey's cure is the wonder of everybody; she now does her own housework, including her washing. (Mrs. L. had been given up to die by several doctors and all her neighbors; was a bad case of Cancerous Catarrh, which had poisoned her whole system; she took the "Sure Cure" and "Specific Blood Medicine," and after her cure gave birth to a perfectly healthy child.)

"All are improving who are trying your medicine, and are satisfied, and I am getting to have great faith in its power to cure almost *any* case."

"If any one would have guaranteed me a cure of my Catarrh a few years since, I would have given all I possessed, and I feel that I must go to work treating Catarrh or disseminating *the remedies that will cure it.*"

"The Specific Blood Medicine and 'Sure Cure' continued to give satisfaction."

L. E. MITCHELL, Juniata, Adams Co., Neb., Feb. 24, 1880.—"I write to thank you for the wonderful cure you have wrought on my wife by your unequaled medicines. The case was so severe that I am not capable to describe it, and we cannot find words to express our gratitude; for we know you have saved her from a terrible death that must have come soon, if we had not providentially heard of you. In July, 1878, her throat and mouth were attacked with a terrible sore, and a large bone came out and left a hole as large as a silver half dollar in the roof of her mouth, through into her nose, it then ate very fast clear up through her nose—or so near through the doctor lanced it, and more than once, but could not afterwards heal it. Her pain and sufferings were awful—no sleep or rest: nothing but misery and the sore fast spreading. We employed doctor after doctor, but none of them could give but temporary relief, and some of them seemed to make it eat away faster by the burning medicines they used. They called it a cancer, and, finally, after it had eaten more than half her nose off, the doctor who had attended her for about a year called a council of physicians, and they decided it to be a cancer, and said the treatment she was taking was all right, and that all had been done that could be done. They said the eating could not be stopped, and it would certainly kill her in less than three months, and there was no cure for her; so we accepted it as the will of God that she must die

Her desire to see her father, brother and other relatives in Jackson, Mich., before she died, was so great that I bid her 'good bye' never expecting to see her again, and she set out on her sad journey. Before reaching Chicago a kind-hearted minister, the Rev. M. L. Vorheis, of Burlington, Iowa, on the same train, learned the particulars of her case, and insisted upon it that Dr. Sykes, of Chicago, could cure her, and that she must stop and see you; also told her of a wonderful cure wrought by you on a Mrs. Henry Avery, of Burlington, Iowa, of a cancer in the throat. As it was too late in the evening on her arrival to see you and not time in the morning before the first train, she hurried on and then wrote you from Jackson. Your answer was prompt, but not at all encouraging; but after reading some of your cures of what you call 'Cancerous Catarrh,' she and her brother started at once to see you. I wish you would describe how she was when you first saw her. But I want to tell the world that in a little over ten weeks from the time my wife left home I went to meet her at the depot, and she had changed so much in her looks that I passed right by her, and did not recognize her till I heard her happy voice. Her nose was all healed up, and she looked so good and happy, and she weighed 25 pounds heavier than when she left home. All our neighbors look upon her wonderful cure as a miracle; she is now a stout and healthy woman, and is doing the work of our large family, a well and happy woman. We cannot express our feelings towards Dr. Sykes as we would like; we are overjoyed, and can only say, "God bless you, Dr. Sykes."

I saw Mrs. (Nancy) Mitchell on the 9th of October, 1879; her brother, A. S. Wing, of Jackson, Mich., was with her, and can vouch for the description I will here endeavor to give. First, when the cloths were removed from her face, she was an awful sight to behold. Her nose was entirely eaten off from the ridge in line with the eyebrows down on the right side to the eye, and to the cheek in a circular form, coming out within half an inch of the end of the nose; the flesh and bones all gone on that side; and was eaten down fully one-third of her nose on the other side. Her cheeks and eyes were badly swollen and inflamed, lancinating pains all through the sore, and severe pains all through the head. The nostrils were equally as raw as the external sore, and the quantity of matter discharged was estimated at about half a teacupful daily, the cavity was open clear through into her mouth. She had but little appetite, and said she had not had a good night's sleep in over a year. I saw her every day for two weeks, treated the sore with a mucilaginious preparation, then with what I call a cancer powder, used an ointment, the "Sure Cure" and "Specific Blood Medicine. During these two weeks Mrs. Mitchell boarded with Mrs. L. Andrews, at 721 West Lake street, and she can also vouch for the case and cure. I never saw a sore heal so rapidly as this, or a patient gain faster; in two weeks she returned again to her father and brother in Michigan, taking medicines with her, where she stayed eight weeks, the nose healing up sound within that time. She returned to Chicago Saturday, December 20, put a notice in Sunday's Tribune and Times of the 21st, announcing her cure, and asking interested people to call and see her at my office from 2 till 4 p. m., Monday, (and about thirty called), and she started for her Nebraska home next day, saying she was the happiest woman on earth.

The Rev. W. J. Chaplin, of Dowagiac, Mich., happened to ride in the seat with her to Chicago, and gives me the privilege of referring to him in proof of the cure. Prof. Henry Olin, of Bennett Medical College, office corner of Madison and State streets, saw her that Monday morning, and speaks of the cure as one of the greatest he ever saw. I have Mrs. Mitchell's photo in my office, taken on that Monday after her cure, and notwithstanding she is badly scarred, the deformity was not so great as a person would naturally suppose. Let me also add that previous to coming to me her treatment had all been of the cauterizing type, carbolic acid being about the mildest of any, and she was using this daily until the blood would gush from the gaping sore. Nearly all of this kind of cases I get have also been treated by this barbarous mode. Will not my fellow physicians learn a lesson from these cases and let their patients live?

In dismissing this most interesting case I want thus publicly to thank the Infinite Spirit of the Great Physician, who made me the humble means in His hands of snatching from the very grave this sorely-afflicted woman and thus bringing joy and gladness to her family and friends.

The above are but samples of what the remedies have accomplished. Price of the "Sure Cure" and "Insufflator," all complete, is only $1.50. Book of full information, ten cents, well worth a dollar. Name the Rural New-Yorker in writing, and address,

DR. C. R. SYKES,
169 Madison St., Chicago, Ill.

HANSEN'S DANISH LIQUID

BUTTER COLOR.

Prepared in vegetable oil by skilled chemists. Does not color the buttermilk. Imparts natural rich color and *enhances price* of butter greatly. Largest and finest butter-makers have adopted it. Sample by mail, free.

WHITMAN & BURRELL, Little Falls, N. Y., Wholesale Agents for America.

$777 A year and expenses to agents. Outfit Free. Address P. O. VICKERY, Augusta, Maine.

AGENTS WANTED EVERYWHERE to sell the best **Family Knitting Machine** ever invented. Will knit a pair of stockings, with HEEL and TOE complete, in 20 minutes. It will also knit a great variety of fancy work for which there is always a ready market. Send for circular and terms to The Twombly Knitting Machine Co., 409 Washington St., Boston, Mass

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

CONDUCTED BY
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
78 Duane Street, New York.

SATURDAY, APRIL 24, 1880.

REMOVAL.

On and after May 1st of this year the Rural New-Yorker will occupy its new quarters, No. 34 Park Row, corner of Beekman Street.

Milking Prizes. The British Dairy Farmers' Association, offer a large number of prizes for the best milkers to be exhibited at their show next October. We understand that Short-horn, Ayrshire, Guernsey, Jersey, Kerry, Dutch (Holstein), and some other breeds will be entered there for competition. Would it not be worth the while of some of our own dairymen to send a few cows there? If the richness of milk is to be considered as well as the quantity given, we are confident no cows can excel the American. Where are the records in any country of cows like ours making 500 to 600 pounds each of first-quality butter per annum?

Noxious Drugs to Horses.—Grooms are too much in the habit of administering these, wholly careless or ignorant of their injurious effect. This is particularly the case with arsenic, which they freely use, in order to give horses a finer and more showy coat of hair. We often hear of cases of the death of horses from this cause, both at home and abroad. It is an imperative order from us to our stable men to never give medicine of any kind to our animals without first consulting us. In some European countries, particularly in Hungary, we have heard that the lower class of females are almost insanely addicted to the habit of taking arsenic, to improve the complexion of the face. In a short time the system gets so accustomed to this dangerous drug, that a delicate female can take enough at a single dose to kill half a dozen stout men. But a continuation of these doses for a few years is sure to result in premature death.

It is proved, where fish are preserved in many of our bays open to the sea, and even in some few lakes and streams, and not allowed to be caught except at proper seasons, that, acre for acre, the water furnishes a more valuable product than the richest and most highly cultivated land. We are glad to notice that more and more attention is given to this matter annually, by the United States and single State Governments, also by private individuals. Fish add a great variety to our food and are alike healthful and palatable, perhaps more so than most kinds of meats. By exchanges with foreign nations, many new kinds have been added to our waters, and we are promised more. In consequence of this our products are continually increasing, and some waters, in which, heretofore, little of consequence found life, are now producing largely, as in the instance of the European Carp which subsists solely on vegetable matter growing in the water.

Wheat and rye for late autumn, winter and early spring pasturage are extensively cultivated in many districts of our Southern States; and for the first and last season, we cannot imagine why they are not more cultivated in the Middle States, as high up, at least, as the 40 and 41° of north latitude. Our farm is in the former latitude, and we have been in the habit of sowing these grains for pasturage for years past. We sow through the last week in August to the first week of September, and by the last of October the grain gets so rank and high as to give a good bite, and this gain occurs ordinarily by the last of March or the first week in April. If left to grow, rye is fit to cut for soiling by 15 to 25th of May, and wheat a few weeks later. The soil on which these grains are sowed for pasturage, should be a rich, warm, dry loam; there is then no danger of poaching in turning stock on so late and early; but yet this stock ought to be of the lighter weights. Sheep may be of full size; but the cattle should not be over 6 to 24 months of age. When rainy, the stock must be kept off, and if nights are frosty, don't turn on *till* the sun has dried it up. A ration of linseed or cotton seed meal should be given night and morning, to keep the bowels in good order.

Mr. Parsons, in an essay from which we have quoted under What Others Say, speaks of the Sun-ray Pine (Pinus Massoniana, var.)as having received its familiar name from the fact the "leaves are so clustered on the sides of the branches as to spread in every direction." The Rural New-Yorker used the word "Sun-ray" in writing of this golden variety several years ago, simply because the yellow needles reminded the writer of the sun's rays. We were not aware that it had been so called previously, or we should not have claimed the credit of that very appropriate name. Mr. Parsons speaks of the peculiarity of its late variegation. We have before alluded to the fact that when the new leaves first appear in the spring a mere dot or transverse line of yellow is seen. As the leaves lengthen, it appears that this yellow dot or line alone elongates, so that finally the greater part of the leaf is golden yellow. This color is retained through the winter, presenting a bright and beautiful sight either in contrast with the snow or with the dreary appearance of the winter garden in general. We can recall no other instance in which any plant so highly variegated as is the Sun-ray Pine is possessed of so much vigor, while at the same time the variegation is entirely constant.

Our references to this beautiful conifer are always followed by many inquiries from our readers as to where it can be obtained. We anticipate them in the present instance by saying that we are not aware that it can as yet be purchased anywhere or at any reasonable price—but the stock in another year will probably be extensive enough to warrant its being placed in nurserymen's catalogues.

There has been, besides a great deal of valuable truth, a great deal of bosh written as to the dependence of flowers upon insects for their pollenation. When a new medicine is discovered for a certain disease, physicians and credulous invalids in general are very ready to attribute to it curative powers of so wide a range, that it becomes valued as well-nigh a "cure-all" ere its specific power can be well tested and proven. Of late years the same jumping at conclusions has been evident as regards insects and flower pollenation. Wherever any peculiarity exists in the position of the stamens, the petals or other parts of a flower, some ingenious theory has been conjured up to show that fertilization is dependent upon insect agency. It has been stated we know not how many times that Kalmia latifolia, the well-known Calico-bush or Mountain Laurel, is of this class. The anthers rest in little pockets of the corolla which, as it expands, holds these, causing the long, slender filaments to recurve. The theory is that insects at this stage of the flower's development, working at the nectar tubes below, free the anthers from their pockets and, the strain upon the elastic filaments being removed, the pollen is thrown upon the stigma of the same or other flowers. Whence it follows that insects are essential to the fertilization of the Kalmia ovules!

The writer of this note, for a week or more past, has had the opportunity, among the Kalmia groves and thickets of South Carolina, of observing how entirely mistaken this pretty theory is. In most cases the natural expansion of the corolla frees the stigmas from their pockets. In other cases this natural movement is precipitated by the wind. A gentle shake of the corymbs of well-expanded flowers was sure to shoot off a number of stamens, while others could be seen here and there shooting voluntarily. Of the very few insects which were seen visiting the flowers all rested upon the *top* of the filaments and, instead of exerting any force to free the anthers from their pockets, served rather to hold them down more securely. A large bouquet of buds and partly developed flowers was taken to the house and placed in water. Here, as in the woods, the flowers opened and, as the corollas spread, the anthers were loosened, shooting pollen grains sometimes to the distance of a foot or more.

ANOTHER BENEFIT FROM AGRICULTURAL COLLEGES.

It is to be presumed that the agricultural colleges have been instituted for the general public benefit. It is not to be supposed that their complete end and purpose are to educate youths only for the profession of farmers. Have not the parents, the full-grown men, some claim to be educated too, and should not the influence of the college go abroad to the farm and not be confined to the class room, the laboratory and the experimental plots and pens? So far these institutions have done great good. One cannot expect that they should find their full development in a year or two, or even in many years. Their officers and teachers have much to learn in the way of finding out how to teach most effectually, as well as to teach. It is a new business to be built up upon a foundation hidden and to be groped for and surveyed in the dark. But it is gratifying to know that year by year the professors are accomplishing a good deal and are finding out ways of doing more. We would throw out a suggestion which may possibly lead to a valuable service which may be done upon the college farms. Many prominent farmers and agricultural writers are interested in the improvement of of our grass lands by increasing the varieties cultivated. Grass is our greatest crop. In value it surpasses corn, cotton and wheat together. As hay and pasture, it should be credited with a large portion of the value of live stock, dairy products, meat, wool, hides, tallow (including oleomargarine, of course), poultry, eggs and pork, wheat and produce. It is admitted that our grass is not made the most of; that we need to grow more than two or three varieties and to make our pastures and meadows more permanent. Recently our contributor, Prof. Beal, referring to this subject, mentioned the difficulty there is in procuring seeds of varieties not usually grown, and in the present issue Mr. Wysor refers to the same trouble. We have experienced this difficulty, and it has to our knowledge greatly hindered the seeding of grass lands. Could not these grass seeds be grown to some extent upon the college farms and sold in small quantities, pure and fresh, to farmers who wish to grow such grasses. Certainly it would be a small beginning, but every great improvement has had a beginning, and from this small starting point it would be but a few years before these seeds, home-grown and fresh, would be regularly in the market.

HOW TO BUY A HORSE.

Look at him standing quietly in his stable, to see he has no trick like that of putting one hind foot over the other. In doing this he often cuts the fore-part of his hind foot with the sharp calks of his shoe, thus making him lame perhaps for months. When brought out, do not allow him to be jockied in his paces. Take your stand on one side of the road, and let him walk naturally and quietly by; then turn and walk by, showing his other side. Now stand behind and have him walk off in front of you and from you; then turn and walk towards you. Observe if he goes freely and easily and plants his hind feet in the tracks of his fore feet. Next, have him trotted by you, and back and forth, watching his action closely.

Now look at his eyes and make a motion with your hand towards them, as if you intended to strike. If he winks quickly, or draws the head back, the vision may be depended on generally as good, and no blindness in him. The eyes should be moderately prominent. Sunken eyes are apt to get blind as the horse grows old, and often characterize a vicious temper. Examine the teeth and see that they are sound, strongly set, and even. Look at his fore legs and notice if he has strong knee joints, and that they are not sprung. Examine the hind legs closely above and below the hocks for any swellings, and especially for curbs and spavins. Now look at all the pastern joints and see if clear of cuts from interfering, or if there are any scars on them in consequence of this. The pasterns should be rather short for a carriage-horse, and not much sloping. If the latter, and long and elastic, they are apt to give out at a hard pull. In a race-horse such pasterns are less objectionable. In a heavy draft animal they are unpardonable.

The feet are often passed over, but a thorough examination of these is of the utmost importance. They should be reasonably large, the hoofs clear and tough, free from cracks, not shelly, and well set up at the heels, otherwise they will soon wear down on pavements or hard roads, and the horse become foot-sore. If always to be kept in the country to work on a farm or dirt roads, low heels are not so objectionable; lastly, regard the inside of the hoofs and see that they are free from corns, and that there is a good-sized frog to soften the jar to the leg, when the foot stamps on the ground.

A pony-built horse is the best for working in harness, while a more rangy-bodied one, with longer legs may be preferable for the saddle, but these should not be so long as to be liable to weakness. The legs, from the hocks and knees down, in all horses should be rather short than long.

If the tail lifts hard and stiff, it is usually an evidence of a strong back and quarters. If it lifts quite limber and easily, the reverse is apt to be the case.

As to the age, this is readily told by the teeth till seven years old, unless they are "bishoped." It is usual for jockies to call a horse eight when he is all the way from ten to twenty; but an adept can give a pretty shrewd guess as to this, for after ten years old the eyes begin to sink, gray hairs come into the head, and there is a want of youthful look and vivacity.

After all, there is a great risk in buying a horse, even from an owner who is truthful and honestly disposed to speak of his failings; for in many cases he is really ignorant of what these are or of incipient diseases which may be lurking in the system at the time of sale. As for the tricks of jockies in hiding the age, faults, and covering up diseases, they are past finding out; and when they trade with each other even, the very smartest and most knowing one gets cheated easily by one much more skillful than himself in showing off a horse. It is only after using a horse for months that pretty much all that there is in him can be found out, and we have known unexpected faults and vices to turn up after possessing one for years.

In the city stables so many horses are kept under the same roof, and there is such a want of proper ventilation that "pink eye" and the "horse distemper" are often prevalent there, or if not shown at the time of purchase, these break out soon after. It is safest to buy a horse immediately upon its arrival in town, before he has a chance to get discussed, and before the sellers have time to "slick him up." Never mind a dirty coat and rough looks; you can clean the former and smooth the latter without risk to the animal as soon as you get home, and after this he will probably show 25 to 50 per cent. better than when you bought him. One rather thin in flesh is safer to buy than when fat, for this covers bad points, and when worn down somewhat a rather fine-appearing horse turns out to be very common-looking.

BREVITIES.

Our Market Reports show clearly the small number of varieties of grass seeds regularly quoted in the chief markets of the country.

Last year we gave an engraving of the double white Chinese Wistaria. Our correspondent in South Carolina has seen what purported to be the above, but the flowers were *single*.

"From the best information that I can get," says our Aiken (S.C.) correspondent, "the acreage of cotton in this part of the South will be over 25 per cent. greater than last year."

To prevent milk fever in cows the London Agricultural Gazette says: give ten drops of the strong or "mother" tincture of aconite, in a wine-glass of cold water once a day for about a week before calving; also a dose as soon as possible after calving; then three or four times a day for a couple of days, after which period the danger may be considered over. In addition to this, if the cow shows a great abundance of milk in her bag, a moderate quantity of this should be drawn out daily a week before calving.

Mr. Meehan observed during a visit to James Vick that he is at present particularly interested in Phlox Drummondii. That was always, we believe, a favorite of Mr. Vick, and there are few bedding annuals that give more satisfaction. It is a great favorite in some parts of the South also. The writer of this six weeks ago, was admiring beds of Drummond's Phlox in the gardens of Aiken, S. C. In that climate, when once planted, it is always planted and, indeed, in a few years becomes a weed, if we could suffer ourselves to apply the word to so beautiful a plant.

During the past week forest fires have been exceptionally wide-spread and disastrous in New Jersey, Pennsylvania and Virginia. Besides the enormous loss of valuable timber caused by them, much farm property has also been destroyed, in the shape of fences, hay grain, barns, etc., and in many cases it has been only by the greatest exertion on the part of the neighborhood, that isolated farm houses and even villages have been saved from the flames. In some cases losses of stock and even of human lives are reported. Many of these fires have, doubtless, been due either to the carelessness or malice of tramps—another cause for the suppression of these pests.

The returns of April 1st to the Department of Agriculture show an increase in the area sown in wheat last fall of 13 per cent. more than in the fall previous; in the area sown in rye there is a decline of six per cent. as compared with the year previous. The condition is 98—precisely the same this April as last year. There was a large increase in fall-sown wheat in those States that heretofore have exclusively sown in the spring. As shown in our recent reports, the experiments were unfortunate, and all—particularly Iowa and Nebraska—report great disaster from the winter. On the whole, the wheat crop thus far looks as favorable as in the spring of 1879, except, of course, in the spring wheat belt. The condition of live stock, as represented, is very favorable—better than for several years. No disease is reported other than cholera among the swine, and that is no worse than last year, if so bad.

For Women.

CONDUCTED BY MISS RAY CLARK.

THE COUNTRY-GIRL'S LETTER.

DEAR SIS—Here I am in the city;
Cousin Minnie is kind as can be;
Uncle John calls me "dear little daughter;"
And yet, Sis, between you and me,

I am awfully homesick this morning
For the little white house by the mill;
The world seems so wide round about me,
Such a wee little corner I fill.

Cousin Minnie has beautiful garments
Awaiting her wearing. Don't say
Anything to our dear little mother—
My cashmere is made the wrong way;

And I see Aunty looking unhappy
Because it don't set as it ought;
And the cut-away hitches in wearing—
Don't set like the one Minnie bought.

But don't breathe a whisper to mother,
Who thinks I am stylishly dressed;
I'll try not to care about fashion,
Or whispers: "She came from out West."

Mr. Austin comes here to see Minnie,
I think he's her lover. Ah, me,
If he really fancies, and loves her,
How happy that girl ought to be!

I'm afraid of his eyes blue and steady,
He thinks I am awkward I know,
That's the reason he stares at me, often
And makes my hot cheeks redden so.

Well—he is not my world forever,
What matters it any way, then?
But I want to come home, little sister,
And never leave Willow again.

POSTSCRIPT.

I don't know, I'm sure, how to tell you,
I'm dazed, and it will not seem true.
But he loved me instead of fair Minnie!
He talks about roses with dew
On their freshness. He seems not to care
In the least about beautiful clothes;
He's going to father to-morrow
To ask for a wild country Rose.—*N. O. Picayune.*

DESCRIPTION OF CUTS.

No. 130. Design for cross and Italian stitch.

No. 131. HORSESHOE PENHOLDER.—The whittler ingeniously inclined may utilize this design for practice of skill.

No. 128. TABLE COVER:—The cover is of crash, embroidered in cross-stitch with colored cotton, zephyr or silk; the ends are finished with fringe with an embroidered heading. Any design may be used for the embroidery which suits the taste of the maker.

No. 129. BORDER: CROSS AND ITALIAN STITCH.—This design is suitable as a border for table covers, etc.; it is worked in cross and Italian stitch, with cotton or any other embroidered material.

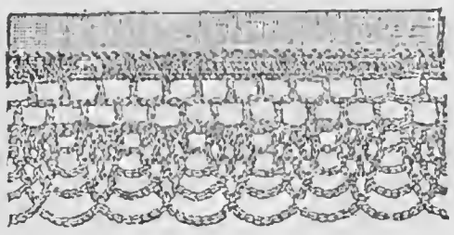

FIG. 127.

No. 127. CROTCHET EDGING.—Make a chain the ngth required.

1st Row: One treble into each stitch.

2d Row: One treble into a stitch, three chain, pass over three stitches, and repeat.

3d Row: One treble into second of three chain of last row, three chain, one treble into the top of last treble, one treble into the centre of next three chain, * three chain, one single into the first of three chain, repeat from * three times more. Repeat from the beginning of the row.

4th Row: One double separated by four chain under each of the loops of three chain of last row, two chain. Repeat.

5th Row: One double separated by five chain under each four chain of last row, five chain. Repeat.

6th Row: One double separated by five chain under each five chain of last row, seven chain. Repeat.

7th. Row: One double under the five chain of last row, eight chain. Repeat.

FASHIONS.

ALTHOUGH the fine weather has brought out several novelties in out-of-door costumes, yet it is much too early to lay down the law with certainty as to what will be fashionable for the early summer. However, from what is now seen already, it is probable that mixtures of stuffs and colors will be more than ever prevalent, and that short, round skirts, with long casaquin bodices and casaque jackets, and pleated bodices round at the waist, will be generally fashionable for young ladies.

The long dress, half-train, and short skirt are as yet equally in favor for visiting, dinner, and evening dresses. Instead of the chief part of the costume having a plain ground, it will be the contrary. The dress itself will have a pattern, and the ornamentation, such as collars, scarfs, drapery, frilling, &c., will be of plain material.

Up to the present the new patterns consist of small spots, or birdseye pattern, lozenges, minute checks, stripes, and small detached flowers, on foulards, serges, mohair, poplin, and muslin-de-laine.

The casaque jacket most in vogue just now is made high at the neck, with two rows of buttons cut out under the waist in front; it is square at the back, and is often made of the same material as the dress, or in plain cloth or velveteen striped, the colors being different shades of stone grey, dove, beige, and a reddish brown color called mordaree.

From what is seen in the arrivals from Lyons the changeant or shot-silks will be much worn; the new colors in light shades are lilac, light blue,

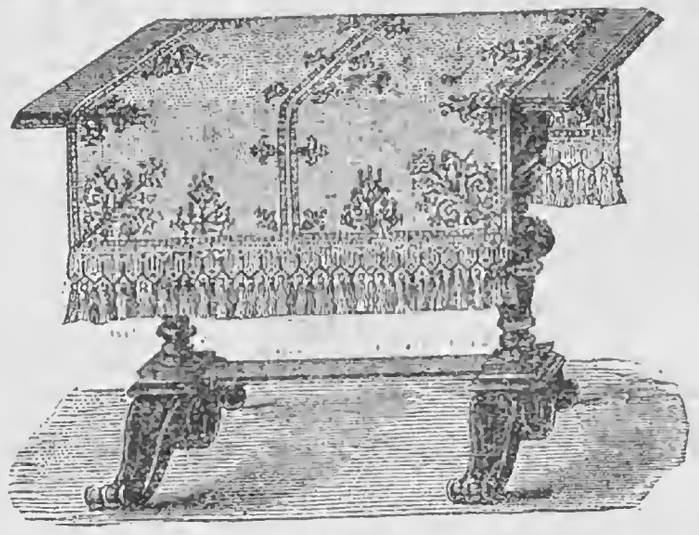

FIG. 128.

silver-gray, dove, and mauve in many different tints; the dark colors most fashionable are blue, bronze, violet, old gold, cherry red, and a reddish-prune color called Ophelia; one shot-silk very much in favor already is called gorge de pigeon.

Black satin is extremely fashionable for visiting, dinner and evening costumes; the shapes are very much the same as a few weeks ago; those for evening wear are profusely trimmed with jet and colored steel-bead embroidery; the sleeves are very often of black lace, or with net, satin bands like bracelets.

Dinner dresses are still made very much to resemble the costumes of the 16th, or those of the last century. In one instance they have the high Mary Stuart collar at the back, and are square cut in front, with skirt, for instance, of Ophelia, with cut velvet opening in front from the waist to the bottom, over a white or silver-gray puffed satin, the bodice having basques or pointed long waist, and the sleeves being either slashed, or of crepe lisse with bands of Ophelia prune satin embroidered with pearls; or in the other they are of the Louis XIV. style, with round low bodice skirt of brocaded silk with tunic of satin, and long train. The trains just now are made much less full, and are square at the bottom; the square-cut bodice is made narrower and very low, with frill and high pleats of crepe lisse, lace and point d'esprit. Sometimes crepe lisse is embroidered with gold thread and colored silk.

All kinds of mantles are to be trimmed with fancy galoons, embroidery, pleatings, frillings, jet feather galoons and fringes. A great many of the so-called novelties are much like the well-known "visite" shape. Pelerines are to be worn. One of the new paletot jackets in Sicilienne has a long frilled waistcoat of faille; another paletot without trimming is made of cloth, is tight-fitting, the buttons are in one straight row, and it has a pelerine or Garrick as low as the shoulders, and a directoire turned-back collar in front; but as yet there is really no very striking novelty.

Bonnets are made with broad scarf-like tie strings of foulard or silk. Some of the newest have strings of figured gauze. One of the newest shapes without strings is called the "Creole," a kind of small Rubens hat.

A PERPLEXED "FARMERINE."

WILL you help a perplexed "farmerine" with some advice? I live one mile from a flourishing college town where we attend church, and though I desire to be "adorned with a meek and quiet spirit," yet the subject of dress demands *some* attention, and as I am my own dressmaker, I would be thankful for any suggestions you may be so kind as to offer. And bear in mind, please, that I'm not possessed of great means, but must make every cent go as far as possible.

In the first place, I have a good, black silk dress made 16 years ago, with wide, ungored, trailing skirt. It is an excellent silk, but it is the "shiny" sort. Are such "shiny" silks worn now? If so, what shall I get to trim, or make it up with; and how make it, &c.?

What would you advise for suits for girls 15 and 17 years old, something that would do for spring and fall wear, not costing over fifty cents per yard?

What summer wash goods would you recommend, and could you give some hint on making so that we farmers' wives could do some of our summer sewing now?

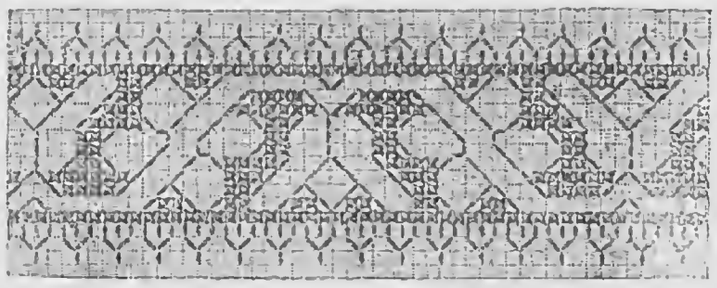

FIG. 129.

What kind of neck-wear, lace, bow, or something quiet and lady-like, not costing over one dollar, would you advise for myself? I like to be neatly, and, if possible, stylishly dressed, to please my husband and children, which I think should be the aim of every wife and mother?

An answer to the above may give some new ideas to other farmers' wives, who like myself, have more taste and love of nice things than they have means to gratify. MRS. M. A.

ANS.—The "shiny" sort of black silk is not in vogue; if, for economical reasons it must be used, it will be best to mix it with "novelty" goods. Cuts have been given previously in the RURAL that may be utilized in making.

There are so many kinds of goods that we scarcely know which to recommend for a miss; debage and novelty are two.

For wash goods, gingham, mohie cloth, cambric or calico may be used; a blouse waist with plaited or ruffled skirt, or plain skirt and overskirt, or a skirt and polonaise—of which there are many styles—would be suitable for summer wear. Make a square handkerchief of India muslin and edge with lace, or make bow, after styles in issue of Jan. 24th or Feb. 28th, using Breton, Languedoc, or imitation Valenciennes lace. A bow of tulle would also be becoming.

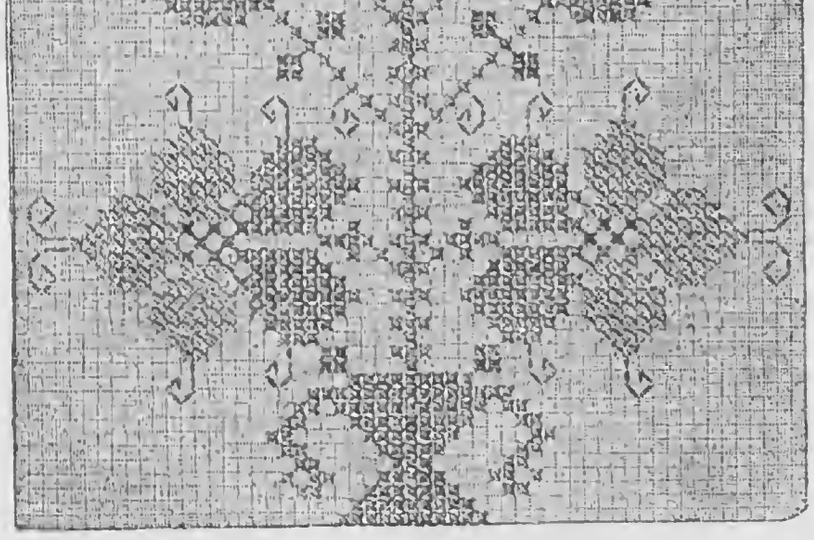

FIG. 130.

REMINISCENSES OF SPRING.

THERE is a hint of spring in the air, a suspicion of violets and trailing arbutus in the soft south wind. Trailing arbutus! What memories crowd around the word and multiply as the fancied odor of their lovely blossoms are wafted to my mind from out the halls of the vanished past. Long ago I used to hunt for this lovely trailing flower in the soft April days. They grew on a bleak hillside near my home. Up among the crevices of the rocks, where a bit of soil had accumulated and a tiny sea of moss shielded it from the weather, I would find a bunch of these flowers, waxen white and so pure that I would hold my breath as I gazed. Then down through a miniature forest of hemlock, and birches to a hollow by the brook, where, under the sodden leaves, they nestled in rare loveliness, a spray of creamy white or dazzling pink Oh! so beautiful; like good deeds discovered unexpectedly 'neath a homely exterior; then again down by the water's edge, where the delicate bells were bedewed by its touch, clinging to a patch of earth. These, perhaps, would be white (formerly) but just tinged with a pink glow, as though the sunset had kissed their faces and the smile remained. I remember how I would crouch down on the cold ground—making a ludicrous figure, no doubt, in my cow-hide shoes and short frock, while my unmanageable hair tumbled over my eyes—and touch them with reverend fingers, and wonder in a vague, childlike way, if the roads in heaven were bordered with such as these. Another treat I used to enjoy in the springtime was the gathering of the shrub called mountain pink in that section, but known elsewhere by the less romantic name of swamp apple. I have never since seen such ravishing shades of pink, no perfumery could ever equal in my estimation the sweet odor of those exquisite blossoms. But in childhood everything looks lovelier than in after years, I think; the sky is not near so blue as when I used to lie in the clover bloom and dream of the future's golden possibilities. My heart goes back tenderly to the past, while the tears drop unbidden, blotting the paper before me. But I remember that in the far somewhere all will be well at last. EVA.

THE RESPONSIBILITY OF MOTHERS.

ANNIE L. JACK.

A FEW Sundays ago a minister in one of our Provincial cities preached a sermon on the immoral tendencies of the young people of the age, and affirmed that the chief fault lay with the mothers who shirked their duty; bringing up their boys and girls ignorant of the laws of Nature and of God. What a charge to mothers is this assertion, and yet who dare deny it?

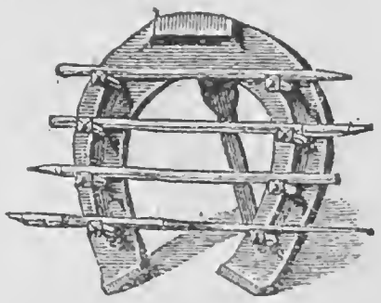

FIG. 131.

To try to bring up children ignorant of the evil that is in the world, to evade their questions, regarding the laws of life, will only arouse a morbid curiosity likely to lead to disastrous results.

It is like the king in that wonderful story "The Light of Asia"—who determined that nothing but what was beautiful should be seen by his son, Prince Siddartha, and sent criers before he left the palace to proclaim. "The king commands that there be seen to-day

> No evil sight; let no one blind or maimed,
> None that is sick or stricken deep in years,
> No leper, and no feeble folk go forth."

But in spite of all his mandates there "Crept forth a wretch in rags, haggard, and foul, an old, old man"—And so the prince learned of age, and death inevitable.

It is thus that mothers try to hide from their children things they are the only ones competent to teach aright, and it is well that among our clergy there are a few fearless enough to speak of this duty too often neglected.

A knowledge of botany inculcated in a proper manner is the first thing to arouse in a child's mind thoughts of the origin of life—"How plants grow"—explains many interesting truths, the transition is easy from plants to the higher order of beings, making the after work easy.

To keep pure in the world, was Christ's prayer; it is one that every mother needs to pray for her sons and daughters; and in this as in many other things "knowledge is power" and a proper understanding of truth a safeguard from evil.

ANSWER TO INQUIRY ABOUT RULES FOR A HIRED GIRL.

I noticed an inquiry in a late RURAL, for rules for a hired girl. If many years experience entitles one to speak on the subject, I should say that there can be no fixed rules for housekeeping. Every house is different in construction, and families vary in size, and what would apply to one household would be out of place in another. Directions for doing different kinds of work can be given but no general rule will apply to each case, except it be the Golden Rule. Consideration and forbearance are always in order on both sides; the more just and upright the employer and employed are, the more harmonious will be the working of the domestic machine. AUNT RACHEL.

Literary Miscellany.

SPECIAL ANNOUNCEMENT.

In our issue of May 1st we shall begin the publication of an original Farm Story, by Charles Richards Dodge, the author of "Louise and I," It combines the bright, practical, scientific and romantic sides of the subject in question, and shows the value of a scientific education upon the farm; also that success may come through apparent failure, and that a woman is a help to a man in the achievement of success. Our readers will be instructed as well as entertained, as the agreeable and impressive manner which is employed to convey the thought of the writer cannot fail to be appreciated.

FARMER BROWN'S PUPIL.

HECTOR BERTRAM,

A few years ago there lived in the southern part of the State of New York, a bluff, outspoken, honest farmer, by name Rufus Brown. Farmer Brown was recognized over a considerable extent of agricultural country as authority on nearly all subjects appertaining to farm management; the proper system to be pursued in order to obtain most satisfactory results, and was looked upon as that rarety, a man who had begun at the foot of the ladder and worked himself up to a position of comfort and independence on the farm. Shrewd but not avaricious, saving but not miserly, industrious, persevering, farsighted; he possessed those attributes which go to make up the practical go-ahead successful farmer,

Farmer Brown was not an educated farmer. He could not make a chemical analysis of the different varieties of soil found on his farm of 200 acres, neither could it be said that he was familiar with the botanical genera of the various plants, and also the weeds which are a constant source of annoyance to the thrifty owner of a farm; yet he rarely sowed a variety of grain on soil incongenial to its successful growth or applied fertilizers which did not have the effect intended.

His knowledge had been obtained from careful experiment and although the old gentleman was at times somewhat stubborn, "set in his way," as the neighbors had it, the position he had attained, the success that attended his efforts, the garden-like fertility of his fields, the contented, happy look of his stock gave ample evidence of the wisdom of his management.

His boys did not grow dissatisfied and desire a professional life, notwithstanding they had graduated with honors at the college where their father had placed them, recognizing in agriculture as wide a range for the development of their intellectual powers as in other pursuits ignorantly recognized by certain classes as more ennobling, more *gentlemanly*.

But we will not weary the reader by a protracted description of Farmer Brown's style of conducting his affairs at present, for this will be shown in the proper place, but will hasten forward to an evening in October and visit the happy, prosperous family as they are gathered about the long table in the wide, airy dining-room of the neatly painted vine-embowered farm-house.

At the head of the table sits the farmer himself, a picture of good humor and content, while opposite, Mrs. Brown, a benevolent, bright-faced old lady, smiles benignly upon her husband and the children on either side, It is unnecessary to give a detailed description of the good things spread upon that table. Farmer Brown was something of an epicure in his way and any one stopping at the farm-house when unexpected, for a meal, would fail to find the fare set before him what is supposed to constitute the regimen of the farmer's table. The conservative pork and beans with a beverage of weak tea was tabooed from the snowy linen cloth, and fresh eggs, chickens well cooked, vegetables and fruit were found in their places.

Alice Brown, the farmer's only daughter had received a systematic course of instruction in a culinary school and by the knowledge there obtained was enabled to prepare numerous strange but luscious dishes, seldom called upon to grace the farmers' table.

"I saw Robert Edwards in town to day," Farmer Brown said, as he leisurely pared a large golden-checked peach, when supper was over and the dessert placed on the table by Alice, "and he told me something about himself which I can hardly believe. What do you think it was, Alice?" glancing at his daughter with a merry twinkle in his gray eyes.

"I'm sure I haven't the slightest idea," the young lady answered demurely, although a vivid crimson mantled her cheek immediately.

"I know," cried Master Tom, the farmer's youngest boy, not so much taken up with the cluster of grapes with which he was engaged as not to notice the conversation going on about him.

"Well, what is it youngster?" Farmer Brown asked, with an admiring look.

"Why, he wants Alice to take to the city and and make a grand lady of her. I know; I heard 'em talking about it the last time he was here. He said he'd be awful proud of her down there in the big new house he's been a building."

"Ha! ha! boy, you hain't far out of the way after all, but that's only part of the matter. He wants Alice, but will not take her to the city. He is going to turn farmer and has asked me to find a suitable farm for him, and also to become his instructor."

"And why does Robert wish to leave the city?" Mrs. Brown asked, as she turned the RURAL she was reading and eagerly scanned the domestic department.

"Because," and Farmer Brown cast a furtive glance at Alice as he spoke; "he has make a mercantile life a failure. The money left him by his father has been reduced by ruinous speculations until he has but a scant ten thousand at his command. To save this little he has decided on investing in a farm and striving by industry and perseverance to retrieve his shattered fortunes."

"And what purchase do you propose to suggest to him?" asked Mrs. Brown nervously, for she knew that whatever home Robert Edwards furnished Alice was likely to share it with him.

"I had been thinking of the Martin farm," Farmer Brown answered slowly. "True, the place has run down badly under the present system of renting which has been practiced upon it; but it is for sale cheap, and I know of no place which possesses all the requisites of a first-class farm, or one which is so near our own;" and the genial old gentleman glanced quizzingly at his eldest child seated at the head of the table, for Alice had long since relieved her mother of this duty, the twinkle of his gray eyes plainly showing his approval of the union sure to follow.

"I see no reason why this should influence you,' Alice answered, demurely.

"But I do," Farmer Brown answered, decidedly; "and I shall write to Robert this evening and tell him of my decision. You may expect the young gentleman at any time," he added to Alice, as he took his hat from the peg behind the range and started for the barn. Farmer Brown was a wealthy man in the general acceptation of the term, yet he trusted to himself alone for the management of the "chores."

The "Martin" farm, of which Farmer Brown had spoken, consisted of one hundred acres of what had once been a fertile, productive soil, but the former owner had left it some ten years prior, and from that period it had received such care and attention as farms generally do that are worked by non-residents on shares.

How this farm, under the careful suggestions of Farmer Brown, was brought up to a state of great fertility; how Robert Edwards, the old farmer's son-in-law, retrieved his fortune on the farm, we intend to tell the reader in a series of articles. That they may meet the expectation of the reader and the approval of all farmers we sincerely trust.

WORK UNDONE.

M. B. E.

Only a soiled, tangled mesh of threads, knotted, snarled and broken; tossed hither and thither by the careless passers by, seemingly a worthless thing.

In their eager search for scientific knowledge of the unknown men pass it heedlessly by, never thinking that within that filthy mass may be imbedded some gem of untold worth.

Perhaps some chance poet may discern its gloomy resting place amidst the scum, and in after time sing a doleful song in memory of its wretchedness; or it may be that some sneering cynic may point it out, and in bitter sarcasm rail at humanity in general for its neglect.

But poet, cynic, and philosopher, alike pass on their way and the sin-stained snarl in Satan's web is none the better for the songs breathed above it, the bold, brazen satire hissed about it, or the utter neglect of wisdom to aid it.

There it lies, trodden deep in the mire, and each passing hour only adds more and more to the deep incrustations of foulness that clothe it; but see—out from the common rabble comes one filled with more than a poet's enthusiasm, and clothed with a truer coat of mail than that of the sarcastic cynic. This one, whose mind is filled with a wisdom beyond that of the most renowned sage of past or present times, plows his way through the dark, noisome stench of all impurities; and with a firm, but gentle hand, draws the object of his search out of its slough up on to the firm true earth again.

Then commences the struggle between right and wrong, honor and dishonor, justice and crime; but Christ's love triumphs at last; and in the glittering gem purified by his love, who can discern the faintest resemblance to the worthless snarl despised of all men? The soiled threads have been cleansed and made straight and now they form the warp and filling of a life that God has consecrated to Himself.

O, ye philosophers! in your search for wisdom's lore have a care for the souls that are perishing beside your pathway. In the slums of iniquity, that you can faintly discern far beneath your proud feet, there may be many a precious jewel crumbling into decay, for the lack of a hand to remove the rust that is slowly but surely destroying its brilliancy. These gems are necessary to complete the Master's diadem, and if you leave the work for other hands to do, what reward can you expect?

What matters it if some strange phenomenon in the atmospheric world should never be explained? God rules the universe, and He understands all the causes of what now seems strange to us; better that one famishing soul be fed with the bread of salvation, than that the workings of a dozen new planets be solved.

You may follow the trail of a comet across the sky, but you can not cause it to deviate one atom from its course. You can not form a planet and set it revolving around a sun of your own manufacturing; but you can throw light into the sunless hearts, and add new stars to Christ's train of followers. Better do the little that you can for Christ's sake, than to add untold renown to your name, as one of the world's sages.

O, ye poets, with your smoothly flowing words, would you put aside fame's crown of laurel to aid a sinful stranger, struggling in Satan's grasp? Your sweet songs of peace, harmony and love, may touch the heart of some partially enlightened mind; but to one steeped in crime, more than a poet's words are needed to rouse the manhood within him. The strong hand clasp must be given, and then you must not scorn to labor side by side with the one you would save.

O, ye cynic, with your crude, half-formed ideas of human nature and that nature's God, what right have you to ridicule other men's neglect? Is the work left undone more theirs than yours? Cast aside your bitter railings, and with bared hands hasten to the relief of your erring brothers. Leave to God the judging, and strive to forget your selfish opinions in the work before you.

Censure as we may, each class of men is necessary to the world's existence; but it is among the common people, we seek for Christ's retinue of workers. These pause not for the barriers Sin erects to block their way, but press on with bleeding feet. O'er stones and stubble, Christ leads the way; now rocky walls they scale, and there beyond lies a vast precipice over which many a one has met their doom; but on they go sustained by God's all powerful hand. These win the day, and on High they swell the throng at The Redeemer's feet.

Then do thy little, O fellow-worker, and cease repining for the fame and notoriety of renowned men. Yours is the noblest part of all if you but do your work without complaint.

Traveling on His Looks.—They were in a railroad car journeying to Chicago. On the opposite seat sat a man of commanding figure and brow, and thoughtful expression.

"What a fine countenance, James; I wish I knew his occupation."

"Maybe he is a lawyer."

"There's too much benevolence in his face for a lawyer."

"He may be a banker."

"Not a bit of it; a man with such a heavenly expression couldn't content himself with money getting. His aim in life is higher than that."

"I guess you are right, Amelia; I'll take your word and his for it."

At the next station an inquisitive farmer took a seat beside the stranger with the noble brow and asked him about his vocation. Amelia held her breath and listened to the reply. It was this:

"I keep a saloon and a meat shop. My wife sells beer and I do my own butchering."

SCRAPS.

What you cannot avoid learn to bear.

You are better employed in drying the tears of others than in shedding your own.

Bustle is not industry any more than imprudence is courage.

Gratitude is the music of the heart when its chords are swept by kindness.

There are many shining qualities in the mind of man, but none so useful as discretion.

The moment a man is satisfied with himself, everybody else is dissatisfied with him.

NEW PUBLICATIONS.

Brain and Mind. By Henry S. Drayton, A. M., and James McNeil. Illustrated. Extra Cloth. One vol. 12mo, pp. 334. $1.50. New York: S. R Wells & Co., Publishers, 737 Broadway.

On the title-page of this new volume is a sentiment which has a peculiar appropriateness, we think, in such a place, viz: "The greatest friend to Truth is Time, her greatest enemy is Prejudice, and her constant companion is Humility;" for with the lapse of time since Gall proclaimed first his new doctrines of mental philosophy, those doctrines have steadily won their way into popular belief, and that in spite of prejudice, bigotry and conservatism. The literature of Phrenology is extensive, far beyond the conception of those who have not given the subject personal consideration, being spread through a hundred or more volumes of magazines. European and American, and represented otherwise by hundreds of treatises on the whole, or departments of the subject. It must be said, however, that within the past ten years or more no volume has been given to the world which presented a comprehensive view of the science and discussed its principles, not only on their philosophical side, but also on the side of their practical relations to the every-day life of man. It was a recognition of such facts as these that set the authors of "Brain and Mind" to work, to prepare this treatise.

A careful examination of this well-written and beautifully illustrated work must convince any one that the aim to be "explicit and clear in its definitions" and at the same time to render its teaching "thoroughly practical" has been kept steadily in view. Whether a reader be inclined to believe Phrenology or not, he must find the volume a mine of interest and gather many suggestions of the highest value, and rise from its perusal with clearer views of the nature of mind and the responsibilities of human life. The work constitutes a complete text-book on the subject.

Chart of English History. By E. M. Lawney. The chart is 24x29 inches, printed in two colors, with chromatic border, and handsomely mounted. Price, $1.00 per copy. Claxton, Remsen & Haffelfinger, publishers, 628 Market St., Phila. Pa.

The purpose of this chart is to present, in a simple and comprehensive manner, the most important and suggestive facts in English history from the time of the Normans to the present day. The central figure represents the sovereigns of England in the order of their succession, the date of accession, and years of reign, and forms the nucleii around which are gathered the data of contemporary history; the matter being so disposed as to give the reader an intelligent view of the social and political condition of any given period in the briefest practicable space. As an aid to further study, and as a reference map it will be of special use to those who do not possess the books from which it was compiled, or who have not time for individual research. *It can be used with any English history.*

The Interoceanic Canal and the Monroe Doctrine. A handsome little book published by G. P. Putman Sons, New York:

It will prove of special interest just at this time when the project of connecting the Atlantic and Pacific oceans by a canal is being discussed. It contains a history of the several surveys and projects that have been made, and reviews the bearing of the Monroe doctrine upon the subject.

NEW BOOKS.

About Grant. By John L. Swift. Red Cloth-Paper Title, $1.00.

Kings in Exile. Translated from the French of Alphonse Daudet, by Virginia Champlin. 12mo, cloth, $1.00. Paper 50c.

With this issue the usual standard is preserved.

Demorest's Monthly.—This number is of usual interest. It contains intelligence from abroad, including a thorough knowledge of the requirements of a refined and elevated taste at home. It includes literary matter as well as fashion, and is prefaced with three engravings, Only a Little Bite, Purity, and Blind Man's Buff.

COLORADO RAILROADS AND RAILROAD TRAVELING.

BY L. G. CALKINS.

* * * * * * * After a very grave council, it was agreed to take the Chicago and North-Western and Union Pacific Railroads to Denver, at present the booming city of this country, if not of the world.

At 10:30 A. M., we were most comfortably seated in one of the celebrated, and I may say world-renowned, hotel cars of the Chicago and North-Western Railroad, and, of course, our first topic of conversation, as it seemed to be with every one after being seated for the first time in really a palace hotel on wheels, was to discuss the situation.

We had heard of these magnificent hotel cars run only on this road, but must frankly confess had never fully understood the maximum amount of comfort and luxury in railroad traveling until this trip from Chicago to Council Bluffs. The interior construction of the car is simply exquisite, and for neatness in appearance and order in all its arrangements there is, perhaps, nothing on this continent its equal.

It being nearly noon when we embarked, we did not have to wait long to have our curiosity gratified as to the arrangements of the culinary department of this institution. An Englishman sitting just opposite us, after enjoying a sumptuous repast in the most leisurely manner, exclaimed: "This way of traveling is simply perfect." We ate as long and as slow as we pleased of food evidently prepared with more than ordinary skill.

Meals are served on the European plan—pay for what you have—so that a traveler does not pay seventy-five cents for a cup of tea and a little toast.

But one of the marked features and crowning characteristics of this road is its *safety*.

The rapidity with which a train of cars moves very naturally suggests the idea of danger to one not accustomed to such rapid traveling.

I had heard the statement that the Chicago and North-western Railroad was the safest in the country. Whether that be true or not, Mr. Editor, I observed two or three facts which I deem it proper to refer to in this connection, for *safety* in railroad traveling is a consideration of no small moment.

First, the road-bed seems to be a perfect one, with steel rails the entire distance from Chicago to Council Bluffs, hence its firm and substantial character is very readily realized as the train passes over it.

Another feature I noticed was the most perfect condition of the cars run on this road. The coaches all had the appearance of just coming from the shop, and seemingly in the most complete order for service and safety.

Another feature of safety was the kind of men

employed to run the trains. They were evidently not of ordinary stock, but were selected as men worthy to be trusted with the lives of hundreds and thousands of people. There was an air of business and stability about them that gives a traveler a feeling of trust and confidence.

Mr. Editor, I have been thus specific on the question of the safety of this road, for this is one of the first things that a traveling public desire to be assured of, and I am satisfied that the company controlling this great and important line spares no pains or expense to make this feature of their road all the public can ask or demand, and this is why this road is so nearly or entirely free from reports of accidents.

In going westward we passed through some of most interesting portions of Iowa in the night, but in returning had a fair opportunity to see some of the finest country in the world in that State along the line of this road.

At home and abroad, Iowa stands as one of the finest farming States in the Union, and the broad acres of growing crops are certainly a rich feast for the eyes. The fields of corn were simply immense, and the herds of fine cattle indicated great thrift and prosperity. And the general appearance of houses, barns, yards, shrubbery, etc., showed that men of enterprise and intelligence had sought and were beautifying homes in this land of plenty.

After a most agreeable ride of less than twenty-four hours, we arrive at the Union Pacific Railroad depot, one of the liveliest and most interesting places in all Cristendom, about 9:30 a. m.—The Investagator.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

THE KITCHEN CLUB.

MRS. ANNIE L. JACK.

We always have a little dread of meeting in "club" at Mrs. Peter Rosevelt's, for although gossip is strictly forbidden, she is a self-established censor among us, with a faculty for making people feel quite uncomfortable at times, without meaning any harm. But her kitchen is a model of neatness, the stove shining in brightness, the tins never dim in their polish, and everything to match. But, then, Mrs. Roosevelt is a widow and lives quite alone in her neat little cottage, owning it, and also the well kept garden and poultry house behind it—which she keeps with trim care, and order. We had custard for tea, the top of which was very prettily festooned with white of egg beaten to a froth and just set into the oven for a moment. Her cake was "Sponge citron cake" and was made as follows: six eggs well beaten and the yelks strained; two cups of sugar; half a cup of butter; two cups of flour, or enough to make a batter; half a pound of citron cut into shreds and sprinkled in last, after being dredged with flour which prevents it sinking to the bottom. Beat up well. This makes two large loaves to which, as a recommendation, I may say we all did justice. The subject under discussion was kitchen work, and it was amusing to hear the different opinions of the members upon this never-failing subject. One lady who seemed to despise her position, spoke at length disparagingly of housework. "*Her* hands were never intended for dish washing" and "it was coming *down* in the world to have to do it"—with like expressions which were convincing proof to any right-minded thinker that her ideas were warped and distorted by the decrees of fashion. I knew she was not one to value her time on account of any intellectual employment; that her reading comprised only the novels of the day, and that her hands were not engaged in any noble work. But it was not fashionable to work, and being unable to keep a servant she made the lives of her family and friends unhappy by repeated complaints. When called upon for an opinion, I said, "Let me simply repeat my favorite and oft-quoted lines, of George Herbert, that ought to be written up in letters that would never fade, for our daughters to read and remember:

"A servant with this clause
Makes drudgery divine—
Who sweeps a room as to thy laws,
Makes that and th'action fine."

"But I don't *like* drudgery" sighed little Miss. Whitand, "especially stove cleaning and Ma is so particular." Then some one turned to our hostess and asked her opinion, complimenting her on the bright polish her's had obtained. Mrs. Roosevelt told us that she bought a polish that was rather expensive, paying 25 cents per packet for it; that her chief secret in stove cleaning was to keep it clean, never allowing the dingy burned redness that requires hours of labor to overcome. Mrs. Welsh gave us some useful hints on dish washing, advocating a rack where the hot, rinsed plates will dry without much aid from a towel, and another lady spoke of the value of old newspapers to brighten windows. Our hostess was eloquent in praise of old-fashioned ideas, and strongly condemned the prevalent notion entertained by young girls now-a-days that their hands are only to be kept for piano playing, leaving all the nice household duties to devolve upon ignorant imported help.

Miss. Lothian asked if one was to be reconciled to hard tough hands that could not "play with ivory keys"—or pick up a skein of floss silk without its being likely to stick to them like a burr? Then our good friend Miss. MacGregor took up the reply and suggested that Bridget's wages be employed in procuring labor-saving machines; that young girls who pride themselves upon their hands are not to be blamed, but should be careful to dry them thoroughly before exposure, especially in cold weather—and always to keep clean holders for lifting anything rough or hot, which habits, with free use of glycerine soap, will tend to check the hardness complained of. Old gloves for sweeping, are not much trouble to put on, and the happiness of many a family would be increased if its younger members took a *pride* in attending to the duties of housekeeping. Elevate your work instead of feeling that you are descending to it, which is a distorted way in which to do "whatsoever thy hands find to do." We thought further comment unnecessary so we thanked our kind friend for her advice and returned home strengthened by the talk.

CANNING TOMATOES, AGAIN—RHUBARB JAM AND JELLY.

MARY WAGER-FISHER.

Mrs. A. B. wonders that any lady should can her own tomatoes when she can buy them for eight or nine cents the quart can, in tin, as she thinks it is cheaper to so procure them. I don't agree with her as to the cheapness for most families. And then, cleanliness is an important item with me. I have heard such dismal tales of what happens sometimes to tomatoes in canning factories, that I prefer to have my own put up at home. As to the sourness of much of my own supply of canned tomatoes, I am convinced that the fault lay in the fruit itself. It had ripened when the season was nearly over, and was not fit for the purpose. Not one of the cans has spoiled through fermentation. Every can is thoroughly air-tight. I know that jugs are good for tomatoes, but I like glass for everything of the sort, so that I can always see how it is "getting on." In putting up tomatoes, like all other fruits, it is always best to use the finest quality of fruit to be had, and never wait until the season is nearly over. Fruit that has matured and ripened while the sun is still hot, has a flavor and richness that none other has.

Rhubarb Jam and Jelly.

Rhubarb (pie-plant) makes excellent jam and a jelly of beautiful color and pleasant taste, that is very nice for serving with roast meats, or for filling paste, or sticking layers of cake together. Even by persons who are not fond of rhubarb, the jam or the jelly is relished, as the rhubarb taste is by no means pronounced. To make either, proceed exactly as with raspberries or currants. If one's stock of jellies has been exhausted by the winter's demands, rhubarb furnishes the material for a new supply; I like it quite as well as currant jelly. But there is no jelly equal to that made from the red raspberry!

WHICH IS THE BEST CHURN?

ELINOR BROOKS.

The subject under present agitation at our house is "which churn shall we buy?" After long consideration and careful reading of testimonials in favor of different ones, we had decided to send for one that had been extensively advertised, although we had never seen one of them in use; when, behold! in one of last week's papers comes a letter (with full signature) from one who uses that churn which says "It takes double the time that other churns do," and as we have just discarded a new one for that same fault, is it best for us to get this one? A burnt child dreads the fire, etc., etc.

A year ago when the old dash churn collapsed, we were much elated when we obtained a handsome-looking dash churn that was worked by a crank. It looked so nice, did not turn very hard, and the theory of its action seemed perfect—but it failed in practice. The testimonials agreed that it never took over 20 or 30 minutes to bring the butter, and when the cows were fresh we *did* churn a few times in half-an-hour, though the average time for churning was one hour. Through summer and fall the time gradually lengthened, until in the months of November and December the churning almost invariably lingered from three to four hours. If there is any other single annoyance in a housekeeper's experience as exasperating as that, I do not know what it is.

Of course, some one will say "The cream was too cold" or "you had kept it too long," or "the cows had poor feed," or "something was wrong." But there was no such cause for the long churning as we never churn, winter or summer, without testing the temperature of the cream by a thermometer. We churned twice a week and the cows, besides having nice, bright corn-stalks, were fed two rations daily of corn-meal. The "something wrong" was the churn. It simply had not force enough in it to work faster, and we proved that to be the trouble by using for three alternate times a churn borrowed from a neighbor, that brought the butter within an hour every time.

The respected man upon whom our churning-work sometimes devolves is not a profane creature, yet I will confess that the strongest exclamations I ever heard from his lips, were, while, with perspiration streaming down his face, he was with superhuman force keeping that churn in motion; and through fear that he might some time be overcome by temptation and actually burst out with a genuine "swear" in the presence of a child whose firmest faith is that "papa never does anything wrong," I have banished that beautiful churn to the realm of good-for-nothing machinery; in other words, to the wood-shed attic from which I most sincerely hope it will never be resurrected. Since its banishment we have borrowed a crank churn, such as have been used in this section, for more than 50 years. It brings the butter quickly, yet it has some objectionable qualities, and we would like something different.

There probably is no other that gives the universal satisfaction that an old-fashioned dash does, yet it is hard work to use a large one, and the aforesaid "gude mon" protests against the cruelty of making him wield a heavy dasher, if there is anything *easier* to be found. What shall it be?

Cure for Croup; Washing Fluid.

As soon as any symptoms of croup appear, give the child a mixture made of equal parts of wine of Ipecac, vinegar and strained honey. Give a teaspoonful of this once in five minutes until the child vomits. Put a flannel on the chest. The chest should be greased and heated for several nights. Care must be taken not to take cold.

A good washing fluid which will not injure the clothes may be made by dissolving one pound of potash in one gallon of water, add one ounce of ammonia, and one ounce salts-of-tartar. When you wash add one teacupful of this fluid, to a boiler of clothes. Soap must be added, and the clothes soaped on the most soiled places. The clothes should be soaked over-night. In the morning wring them out, and boil as stated above. SNOW.

Citron Preserves.

Pare off the rind, remove ends, and cut into small pieces. Weigh, allowing as much sugar as fruit. Boil first in clear water, just enough to cover the fruit, until the pieces are tender; take out and add to the water the sugar. Boil until quite thick, then replace the fruit with two sliced lemons to each pound. Boil 15 minutes longer. If the lady who asked for directions for preserving citron will try the above I believe she will be pleased.

MRS. A. E. L.

Young and feeble mothers with frail children will both become strong by the use of Hop Bitters.

New Publications.

NEW MUSIC BOOKS.

COMMON PRAISE HYMNAL. (30 cts. flexible covers), by J. H. WATERBURY, is a wonderfully good, compact and cheap collection of 150 standard hymn tunes, 170 standard hymns and numerous chants. Examine for Sunday School or Congregation.

News of the Week.

MISCELLANEOUS.

Monday, April 19, 1880.

An outrage was committed a short time ago at West Point Military Academy which has caused much excitement in military, political and judicial circles over all the country. A colored cadet named Whittaker was found one morning in an insensible condition, tied to the bedstead and bleeding from severe bruises. An investigation was made but it failed to reveal the perpetrators, who were supposed to be white cadets. A court was instituted, the interest spread, prejudices arose both for and against Whittaker, and political factions have taken advantage of the opportunity to construct theories on the subject and forward arguments that will further their own peculiar interests. President Hayes is determined to have fair play in the investigation and to this end sent the United States District Attorney to West Point to look after the matter. The perpetrators of the outrage have not yet been found..... Missouri is at present making a determined effort to attract a portion of the immense immigration that is now setting toward this country. A large convention of influential citizens was held in St. Louis last Friday for the purpose of divising the best measures possible to invite and attract settlers.....William L. Bates was hanged at Barnell Court House in South Carolina on the 16th, for the murder of Stephen H. Rush on last Christmas eve. .....Heavy rains and unusually high winds are reported to have occurred in Ohio in the latter part of the past week, which did great damage to property. At Harrisburgh, Pa., the disturbance took the form of a violent and destructive hail and rain storm.....During the past week 500 persons left Halifax and the neighboring country for the purpose of settling in the United States.....It is reported from Yankton, Dakota Territory, that J. M. Haworth, Indian Inspector, has concluded an agreement with the Lower Brule Sioux, by which the Chicago, Milwaukee and St. Paul Railroad Company is permitted to run through their reservation toward the Black Hills. Several chiefs are to go to Washington to celebrate the event. Mr. Haworth has gone to the Spotted Tail Agency to attempt a similar arrangement with the head chief of the Brule Sioux.....

The distinguished English astronomer, Richard A. Proctor, has lately been lecturing on astronomy to large and interested audiences in San Francisco, Cal....The weavers in the Hudson Cotton Factory at Hochelaga, Quebec, are on a strike and have shown great violence to a few of their fellow-workmen who did not join in the strike. The manager is threatened with violence, and they will not return to work unless their demand of 15 per cent. increase in wages is satisfied....The Philadelphia and Reading Coal and Iron Company and other kindred organizations, announce that at the collieries under their control work will be suspended during the three last days of this week and the week following.

AGRICULTURAL NEWS.

Monday, April 19, 1880.

Last Monday a prospectus was issued in London of a company for importing fresh meat from Australia, with a capital of $750,000.....The oleomargarine bill passed the Lower House of the N. Y. Legislature, without opposition on Tuesday last.....On Monday the 12th railroad rates eastward from Chicago were reduced five cents per 100 pounds on grain and ten cents on provisions to New York and proportionately to other ocean shipping ports.....Tulare Lake bed in Hanford, Cal., is five miles from where it was four years ago. On the land reclaimed by the change are found the remains of a corral and cabin, and irrigating ditches can be traced running in straight lines. Wheat is now growing on the bed of the old lake.....The Canal Board at Albany, N. Y. on April 13 adopted a resolution that the toll on foreign salt be fixed at 4½ mills per 1,000 pounds per mile; that the toll on domestic salt going east be reduced to ½ per mill per 1,000 pounds per mile. This is taxing farmers for the benefit of the Onondaga salt works ..... There were two inches of ice on many ponds in New Jersey last Monday, and a heavy snow storm about Montreal... ....The late frosts and cold snap caused some alarm in the peach districts of Delaware and Maryland, but the prospects of a good crop, it is said, were never better .....The Fish Commissioners have begun the distribution of 50,000 California salmon in the Delaware River .....It is urged that there should be a goat in every stable in which a large number of horses are confined. A goat will face a fire, a horse will not, but will follow a goat out of a burning building.....Prof Vennor says that May and the first half of June will be cold and wet, and that after that there will be clear and very dry weather until the end of the year..... The cicadula exitiosa, the new insect enemy of wheat and oats in the South is speeding rapidly. It is one-fifth of an inch long, yellowish in color of upper part of body with a blackish abdomen, and white wings....The Sydney Morning Herald says: "At present prime beef is not worth more than $3.25 per 100 pounds and the average price does not exceed two cents in the wholesale market." ....Heavy frosts on the 14th are reported to have killed the fruit crop about Petersburg, Va., and seriously injured vegetation ...The Erie Canal will be opened April 21 ...There are from three to four million bushels of grain in Buffalo awaiting shipment by canal; part of it is already loaded in boats. Loaded boats will not be allowed to start until there are seven feet of water in the canal.... The exports of cheese for the year ended December 31, 1879, were, from all United States ports, 137,141,427 pounds, vs. 139,249,276 pounds in 1878. ....The cotton crop of Texas is estimated at $57,000,000....Rust in the wheat crop is complained of throughout Alabama....There will be driven from western Texas this spring 301,000 head of cattle. ....It is said that the late cold snap in Northwest Texas killed from 15 to 20 per cent. of the cattle. ....The Agricultural Department values last year's crops at $1,984,430,000; those of the year before at $1,480,570,000, and predicts that those of this year will be worth a plump $2,000,000,000.....According to Senator Davis the Russian Government has spent $14,000,000 on agriculture in a single year against $200,000 expended by ours.... ....Chicago is to have a glucose factory with a capital of $650,000 and a capacity of using 15,000 bushels of corn a day.....Fine prospects for sugar and cotton reported from the South ..... A beef packing Co., at Rockford, Texas, packed 31,500 beeves last year.....Sheep shearing matches are now in order.....Four Professors of Cirencester Agricultural College, England, lately abandoned that institution and are now about to establish an agricultural college of their own at the farm of one of them, Professor John Wrighton, at Charford House, Downton, Salisbury. It is to be known as the South Wilts and Hants Agricultural College. The three associates of Professor Wrighton are Professors Church, Fream and our esteemed contributor Prof. J. P. Sheldon.....

The Market Price of Butter

is increased 3 to 5 cents a pound by using Gilt-Edged Butter-Maker in churning—increases production 6 to 10 per cent. Reduces time of churning one-half. Keeps Butter from becoming "strong" or rancid. Gives a rich golden color the year round. Sold by druggists, grocers and general storekeepers. Send stamp for "Hints to Butter-makers," Address, Butter Improvement Co., Buffalo, N. Y.

ALBION, Mich.

MR. O. H. P. CORNELL.

Dear Sir:—I planted 20 acres of Corn in drills, besides my garden Beans, with the Albany Corn and Seed Planter you sent me last year, in less than *two days*, to my entire satisfaction, Corn yielding more than my neighbors, say 60 bushels to the acre. I think the after tillage is easier and more satisfactorily done, than when planted in Hills or Checks, and shall try it again this year.

Yours, etc., H. D. ROBERTSON.

"WHAT will cure or relieve catarrh?" is a question which has been frequently asked us, and which we have answered to the best of our knowledge in these pages. In this connection we desire to call particular attention to the advertisement, in this issue, of Dr. Sykes's Sure Cure for Catarrh. Besides the numerous indorsements of its merits specified in the advertisement, we have it from thoroughly trustworthy private sources that it is working some wonderful cures of this disagreeable, persistent and dangerous ailment; so that we strongly advise all whose happiness is marred by it, to give this cure a trial.

Cause and Effect.

DISEASE never comes to us without a cause. Ask an experienced physician the reason and he will tell you it is something that inteferes with the working of the great organs. Kidney-Wort enables them to overcome all obstructions and preserve perfect health.

To produce real genuine sleep and childlike repose all night, take a little Hop Bitters on retiring.

"BROWN'S BRONCHIAL TROCHES," when allowed to dissolve in the mouth, have a direct influence on the inflamed parts, allaying Pulmonary Irritation, and giving relief in Coughs, Colds, and the various Throat Troubles to which Singers and Public Speakers are liable.

The delicate structure of the skin renders it sensitive to the slightest obstructions, whether arising from sunburn, dust, or the changing air and wind. **Burnett's Kalliston** is prepared expressly to remove these.

The Markets.

SPECIALS FROM ALL CENTERS.

Until Saturday, April 17.

Baltimore.—WHEAT—Southern red at $1.25@1.27; do. amber at $1.30@1.33; NO 1 Md. at $1.30; No. 2 western winter red, at $1.27½. CORN—southern white at 52c.; do. yellow at 49@50c.; western mixed, at 47½c. OATS dull, but steady; southern at 43@44c.; western white at 42@43c.; do. mixed at 40@42c.; Penn. 42@43c. RYE dull at 88@90c. HAY firm; prime to choice Penn. and Md. at $18@20. BUTTER steady; prime to choice western packed at 23@25c.; roll at 20@25c. EGGS dull and lower at 10@11c. MILL FEED—The trading in City Mills stock is restricted by the limited supply, and the market is firm at $23@24 per ton for both Brown stuff and Middlings. SALT—The inquiry is fair and the market steady. We quote as follows: Liverpool Ground Alum at 95c.@$1 per sack; Fine at $1.60@1.75 for standard brands; $2.60@2.60 for Ashton's. Turk's Island is steady at 38@40 cents per bushel.

Boston—CORN quiet; sales of mixed and yellow at 56@58c; steamer and no grade at 55@56c.; mixed corn to arrive at 54½@55½c. OATS firm; sales of No. 1 and extra white at 48@50c.; No. 2 white at 47@47½c.; No. 2 mixed and No. 3 white at 45@46c. RYE at 92c. SHORTS, fine feed and middlings at $23@25. BUTTER—Western choice creameries 25@31c.; ladle packed, choice at 23@25c.; fair to good at 18@15c. HAY AND STRAW—Rye straw is in fair demand. We quote first quality coarse Eastern and Northern at $15@16 ₱ ton; poor and medium at $11@14. Rye straw $20@22 ₱ ton. ASHES are steady with small sales of Pots at 4½@4¾c. and of Pearls at 6@6½c. ₱ lb. LIME—Sales of 4,000 casks Rockland at 80@85c. ₱ cask. SALTPETRE—Sales of small lots at 6@6½c. ₱ lb; Nitrate of Soda at 4½c. ₱ lb cash. SEEDS—Calcutta Linseed is nominally $2 50@2 56 ₱ bushel. We quote Clover seed as selling at 6¼@7¼c ₱ lb for Western and New York; Timothy at $2 55@2.65 ₱ bushel; Red Top at $2 70@2 80 ₱ bag; Canary Seed at $2 45@2.55, and American Linseed $1 50@1.55 ₱ bushel. PRODUCE little or no change from last week's quotations.

Cincinnati.—WHEAT dull, weak and lower; No. 2 red winter at $1.13@1.14. CORN active and firm; No. 2 at 40½@40¾c. OATS dull; No. 2 mixed at 35@36c. RYE steady at 80c. BARLEY in fair demand; extra No. 3 fall at 92c. PORK firm at $9 80@$10.50. LARD quiet at 6.85c. Bacon easier. BUTTER lower; choice dairy at 22@23c.; choice roll at 18@20c. CHEESE—The receipts are light, but the supply is about equal to the current demand and the market is steady at 11½@12½c. ₱ lb for prime to choice factory. EGGS—The receipts have steadily increased and with only a moderate local demand the market was weaker and closes dull with free offerings of fresh at 9c. per dozen. ASHES—The offerings are light but there is not much demand. Potash is nominally quotable at 4½@5c. and Pearlish at 6@6½c. ₱ lb. SEED—The consumptive demand for Clover and Timothy and other grass seed has fallen off and prices are not much better than nominal. Clover is offered at 6½@7c. per lb and Timothy at $2.60@2.70 per bushel. There is a fair demand for German and common Millet at 90c @$1 and Hungarian Grass at $1 per bushel. Dealers buy Flaxseed at $1.35 per bushel.

Chicago.—WHEAT unsettled but generally lower No 2 Chicago spring at $1 10¾@$1.11 cash; $1.12⅛ May; $1.09⅜ June; No 3. do at 99c. CORN unsettled but generally lower, closing firmer at 35½@35⅝c. cash; 35⅞@36c. June; 36½c. OATS steady and firm at 29⅜c. cash; 30c. bid May; 29½c. June. RYE steady and unchanged at 71½c. BARLEY firm at 78c. PORK strong and higher at $9 90c. LARD unsettled at $6.77½@6 80c. BULK MEATS stronger; shoulders at 5 95c; short ribs at 6 10c. short clear at 6 35c. EGGS at 8½@9c. BUTTER remains dull, with prices weak and declining. Only a limited volume of business was accomplished at the prices given below: Creamery, 27@30c; good to choice dairy 22@26c; medium, 15@19c; inferior to common, 9@13c; roll, 13@18c; CHEESE.—Dealers report a fair seasonable demand, but, as is invariably the case at this stage of the season, values are weak and unsettled. Full cream, 14@15; part skim, 10½@11; low grades, 6@8c. SEEDS were slow and easy. Sales of timothy were reported at lower prices, and the demand was not very large, while a good deal of seed was offered. Sales were made at $2.20@2.53½. Clover was dull and unsettled at $3.75@3.80, and mammoth at $4 10. German millet was in better request, selling at 70c. and other millets and Hungarian were firmly held, the stock being light. Hogs packing, $4@4.24; light, $4.10@4.25; choice heavy at $4.40@4.60; market closed weak, with a good many unsold. CATTLE all except choice fat; lower; medium 10c off; shipping at $3.75@5.35; butchers' weaker; cows at $2@3.50; bulls at $2 20@3.20; stockers and feeders at $2 50@4 50. Sheep market steady; clipped at $4; good to choice exports at $6@6.50.

Detroit, April 16.—WHEAT depressed; No 1. white Michigan at $1.15, spot, April and May; $1.14 5-8 June. CORN quiet and steady. No. 1 yellow at 42¾c; high mixed, 42½c.; No. 1 mixed at 42½c.; No. 2 do. at 42c. OATS dull: No. 1 white at 37½c; No. 2 do. at 35½c.; No. 1 mixed at 35½c.; No. 2 do. at 35c. CLOVER SEED very firm and in active request; No. 2, $3.50; prime at $4.12½.

Louisville.—WHEAT quiet at $1.10. CORN steady; No. 2 white at 42½@43c.; do. mixed at 40@40½c. OATS easy; No. 2 white at 37c.; do. mixed at 37c. RYE steady; No. 2 at 80@83c. PORK quiet at $11.50. LARD quiet; prime steam at 7c. BULK MEATS steady; shoulders, 3¾@4c.; clear ribs at 6 20@6 25c; clear sides at 6 50c. BACON quiet; shoulders at 4¾c; clear ribs at 6.80c; clear sides at 7.10c. Sugar-cured hams at 9@10½c. FIELD SEED—Clover and bluegrass seeds are higher. We quote, delivered from store: Timothy, $2.70; orchard grass, $1 40; red top, 65c.; clover, common red at $4 25, and sapling at $4.50; blue-grass, clean, 55c.; extra clean, 75c. FLAX SEED, $1.40 per bushel on arrival.

Milwaukee.—WHEAT—No. 1 Milwaukee hard at $1.18; do. soft at $1.10; No. 2 Milwaukee, $1.07½. CORN quiet at 35½c. for No. 2. OATS scarce and firm at 30c. for No. 2. RYE firmer at 71c. for No. 1. BARLEY dull; No. 2 spring, 65c. PROVISIONS—Mess pork dull at $9 80 cash and May; $9.95 June. LARD—Prime steam at 6 75c. LIVE HOGS dull and lower at $4.15@4 30.

New Orleans.—CORN quiet at 49@55c. OATS steady at 42c. HAY in fair demand and higher; prime at $22@23; choice at $25. COTTON firm; middling, 11⅞c.; low middlings, 11¼c.; good ordinary, 10⅞c.

PHILADELPHIA—WHEAT dull; $1.29½ bid, $1.31½ asked for April; $1.25½ asked for May; $1.23 bid, $1.24 asked for June; $1.12½ bid, $1.13½ asked for July. CORN dull at 49½c. bid, 50½c. asked for sail mixed for April; 47c. bid, 47¾c. asked for May; 45c. bid, 46¾c. asked for June; 46½c. bid, 47½c. asked for July. OATS—42¾c. bid and 45c. asked April; 41½c. bid and 42½c. asked May; 40¾c. bid and 41¾c. asked June. PROVISIONS quiet. City mess beef at $13; beef hams at $17. Mess pork in car lots at $11.50@11.62½; extra prime at $9. Smoked hams at 9½@10½c.; do. in salt and pickle at 7¾@9c.; clear rib sides smoked at 7¼c.; do. in salt, 7c.; shoulders in salt, 4¼@4½c.; do. sugar-pickled, 5@5½c.; do. smoked, at 5@5½c. Dressed hogs at 5¾@6½c. LARD—Western kettle at 7.62½@7.75c.; do. steam, loose, at 7.35c.; butchers' at 7c. BUTTER steady; creamery extra at 28@30c.; Bradford county and New York extras at 26@27c; Western Reserve extra at 23@25c.; do. good to choice at 18@22c; rolls at 20c.; Penn. extras at 20@22c.; Western Reserve extras at 21@23c. EGGS easier and steady; Penn. at 12c.; western at 11c. CHEESE scarce and wanted; New York factory at 15@15½c.; western full cream nominal; do. good at 13@13½c.; do. half skims at 11½@12c. SEEDS—Clover was a shade firmer at 6¾@7¼c. for fair to choice, the latter asked, but we heard of no business except in a small way. Timothy was dull at $2.75@3 for fair to prime. Flax was held at $1.85, without buyers.

St. Louis.—WHEAT unsettled No. 2 red fall at $1.08½@1 08¾ cash; $1.09@1.09⅛ May; $1.05 June; closing at 95¾c. July; No 3 do., $1.04½ bid; No. 4 do at $1.00½. CORN 32⅝@32½c. cash; 32½c April; 32¾@33⅛c. May; 33⅜@33⅝c. June; 33½c. July. OATS lower at 29½c. bid cash, 30c. May; 30¾@30¾c. June. RYE dull at 69c. bid. PORK dull at $10.10 cash and June. LARD nominally 6.05c. BULK MEATS firmer; shoulders at 3.75c; clear ribs at 5.95c; clear sides at 6.10@6 15c. BACON firmer, shoulders at 4½c. clear ribs at 6.75c, clear sides, 6 95@7c. SEEDS Clover, red $4.10@4 25; sapling or mammoth $4.75; Timothy $2.25@2.40; Kentucky blue grass clean, 75; extra clean, 85; Orchard grass, $1.75@2; Red top or herd grass 56@65; Hungarian 89@90; Millet, common, 75; German 80@90; Buckwheat, 90@1.00; Flaxseed, $1.40@2.

Fertilizers.

Bone ash is nominally quoted at about $22 per short ton, on the basis of 70 per cent phosphate of lime. Bones quoted at $22 50@$23 for Texas and South American mixed, and $25@$26 do. for shin and shank bones. Refuse bone black at $21@$22 per short ton on merit. Sulphate of ammonia at 3½c. ₱ pound on the basis of 26 per cent. of ammonia. Dried blood at $2@$2 30 per unit of ammonia short ton. Alumonia, axonine, etc., for the former at $2 62½@$2 75 per unit of ammonia, and about $2 25 do. for the latter, all short ton. Nitrate of soda, 4½c. Saltpetre, crude 6¼@6¾. The above are wholesale prices; at retail, goods are delivered at boat or cars at the following rates: pure ground bone 47 to 50 per cent. bone phosphate and 3 to 4 per cent. ammonia, $35@$40; dissolved bone black, 15 to 17 per cent. of soluble phosphoric acid $30@$35; dissolved bone 13 to 14 per cent. of available phosphoric acid $30; ammoniated superphosphate 10 to 11 per cent of soluble phosphoric acid, 3 per cent. of potash, 3 per cent. of ammonia, $40@$45; German potash salts, 25 per cent. of sulphate of potash, $15@$18 per ton; muriate of potash, 80 percent, 2@2½c per lb. land plaster 7.50; dried blood, 10 per cent of ammonia, $35@45 per ton; fish guano dry and ground fine, 10 to 11 per cent of ammonia, 20 per cent of available bone phosphate, $40@45; fish guano, 8 per cent of ammonia, $45; unground fish guano, 6 per cent of ammonia, $25; castor pomace; $19@24; sulphate of soda ground, and in barrels, $15@18 per ton; sulphate of ammonia 4½c. ₱ lb; bone black, 70 per cent of bone phosphate, $30@32; ground South Carolina phosphate, 57 to 60 per cent of bone phosphate, $20 per ton; No.1 Peruvian guano, 10 per cent ammonia, standard, $55 per ton; Lobos $46 per ton; rectified $65 per ton; guaranteed $56 per ton; nitrate of soda, 5¼@5½ ₱ lb.

FORRESTER'S potato manure, $47 50; cabbage, $50; oat, $47.50; lawn dressing, $47.50; turnip, $52; grass, $45; hop, $47.50; strawberry, $42 50; wheat, $45; rye, $47.50.

STOCKBRIDGE'S manures quoted: Potato, $50; cabbage, $50; strawberry, $40; corn $45; seeding down, $40; orange tree, $35; onion, $50—per ton each.

MAPES'S complete manures for clay soil, $25.50 per 1,000 lbs; for light soils $25 50 per 1,000 lbs.; "A" brand for general use, $20 per 1,000 lbs.; fruit and vine, $18.50 per 1,000 lbs.; cabbage and cauliflower, $23.75 per 1,000 lbs.; corn, $21 50 per 1,000 lbs.; potato, $24 per 1,000 lbs.; asparagus, $25.50 per 1,000 lbs.; gypsum, Nova Scotia, ground, ₱ ton, $7.50.

BOWKER'S "Hill and Drill Phosphate" $45; Bowker's Phosphate $40 ₱ ton, cash; Bowker's "Food for Flowers," 35c. ₱ package and $3 ₱ doz; Bowker's "animal meal for fowls," $2 50 per cwt.; Ground oyster shells, $1 ₱ cwt.

BAUGH & SONS' prices for goods delivered at depot or boat, in bags and in 2,000 ₱ lots: Ammoniated dissolved bones, $35; pure bone meal, from raw bones, $36; Baugh's raw bone superphosphate $40; Baugh's $25 phosphate, $25; Baugh's A. A. nitrogen, 13½ per cent. of ammonia, $48.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, April 17, 1880.

BEANS AND PEAS.—Light receipts of beans, and the fact that the stock here does not exceed prime 12,000 bbls, gives the market a firmer and prime marks of standard white varieties are quoted with confidence. Red kidners are neglected. Black or turtle soup beans in moderate offering and very firm. Green peas steady at $1.75@1.80, with some recent arrivals. Southern B. E. peas, per 2 bu. bag $1.90@2, with sales. Marrow beans, prime, $1.55@1.60 other, $1.45@1.55; medium beans, prime, $1.40; other, $1.25@1.35; pea, $1.45@1.55; white kidney, $1.55@1.72½; red kidney, choice, $1.40@1.50; other, $1.25@1.35, black, $2.05@2.10; California Lima, $5@6

Receipts of beans for week, 720 bush.; exports, 775 pkgs.

BEESWAX.—Small sales at 24@25c. for Western and Southern.

BUTTER—New has had a light arrival for most of the week, and a day or two of really winter weather put considerable temporary back-bone in prices. Old butter being entirely out of the way, receivers of fine trade marks of new are afforded a commanding position when supplies are, or may be shortened. At the close, trade is shaping for it's usual free selling spring movement for any style of stock that lacks fresh flavor, or is devoid of as good a body as can be obtained by weak butter-producing feed. Supplies are yet in small invoices and are mainly State—the West does not seem to have much to have much to spare for points as far eastward as ours. Creamery is weak as it is not enough ahead of carefully made dairy to give it precedence. During the week 30c. has been made but 2c. off from that for choice now represents a full price; several table and market grade of State and Western are quoted pretty close to each other.

Creamery choice, 25@28c.; fair to prime 21@27c.; poor 23@24c.; State, pails and hf. tubs, choice, 25@27c.; fair to prime 24@26c.; poor, 21@23c.; imitation Western creamery, 23@25c; dairy extra, 24@25c.; other, 21@23c.; do. factory extra, 24@25c.; other 21@23c.; very poor 12@14c.

Receipts for week, 17,050 pkgs.; exports, 3,346 pkgs, the latter mainly representing old crop.

CHEESE.—The market is moderately active, and with the small stocks prices are firm. Exports for the week, 14,800 boxes.

Quotations: 14½@15c.; good to prime at 13½@14½c.; fair to good at 13@13½c.; do. poor at 11½@12c. Ohio factory: Cheddar, fine, 14@14½c.; do., fair to good, 13@13½c.; flat, fine, 14½@14½ flat, good to prime, 13½@14½c.; flat, fair to good, 12½@13c.

Receipts for week, 5,361 boxes.

Exports, 5,524 do.

Liverpool cable, 72s.

Freights, 35s.

COTTON—has been depressed and freely offered at lower prices; latest quotations are for April, 11.76@11.77c.; May, 11.80@11.82c.; June 11.91@11.95c. July, 12.14@12.16c., August, 12.13c.; September, 11.81@11.81c; October, 11.39@11.41c.; November, 11.08@11.10c; December, 11.05@11.07c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

DRIED FRUITS—There is a moderate amount of trade and a steady market Quotations; North Carolina apples, fair to good, at 7½@8½c.; choice, at 9@10c.; fancy at 10@10½c; Virginia, at 7@8c.; N. Y. State quarters sliced at 7½@8½c.; patent evaporated, in cases, choice, at 14½@15c.; good and prime at 13½@14c; evaporated, choice sliced at 13@13½c., and good do. at 12@12½c. Evaporated peeled peaches, good to choice, at 27@28c.; North Carolina peeled, fancy, at 20c.; choice old at 17@18c.; Georgia prime at 16@17c.; fair to good at 14@15c.; common at 10@12c.; unpeeled halves at 7@8c.; do. quarters at 7@7½c. Pulled cherries at 17½@18c. Blackberries nominal at 8@—. Raspberries at 27@28c. Plums at 17@18c.

Exports for week, 100 bbls. apples.

EGGS.—Receipts for the week, 16,649 bbls.; do. last week 10,743 do. The market has lost the buoyant tone that it sounded at year last. The trade at this port has seen it has to divide demand with shade, new garden stuff and other spring produce. Supplies too have loosened to an unexpectedly large extent and sellers are generally trying to work down all the stock they can even at the reduced rates. This is advisable as sudden warm weather will do no good to any held parcels. There is but little fear of Canada stock competing at present figures.

Near Points, 13½@14c.; State and Penn., 11½@11½c.; Western, fresh, 11@11½c; Southern, do., 10½@10¾c.; inferior lots S. & W. 10@10½c.; duck, 17@18c.; goose, 28@30c.

FLOUR—Is in large receipt, and with increased pressure to sell wheat at lower prices, this market is affected.

Latest prices are $3.65@4 60 for inferior to fancy superfine State and Western; $4.65@4 85 for poor to very good extra State and Ioa and lines; $4 85@5.25 for very good to fancy do.; $4.90@4.85 for inferior to good shipping extra Western, and $4 85@5.25 for good to fancy shipping extra do.; inferior to very good extra wheat at $5.00@5.75, very good to very choice do. at $5.75@6.85 (fancy brands held at higher figures); red and amber winter wheat, inferior to fancy grade and family at $4.65@6 65; round hoop Ohio, $4.75@5 25; and trade and family brands of do. at $5.30@6.65, the latter rate for very choice; St. Louis at $4.75@6.65 for inferior to good extra; $5.65@6.75 for good to very choice;

Minnesota clear, inferior to very choice, at $4 60@6.00; Minnesota "straight," inferior to very fancy, at $5.15@7.25, and patent inferior to fancy at $6.00@8.35; unsound stock at from $2 75@5 25; city mill extra at $5.90@6.25 for fair to fancy West Indies; do. for England, $4.60@5.25 for poor to very fancy; do. trade and family extras, $6.25@7.00; do. for South America, $5 00@6.50; No. 2 at $2.65@3.60 for poor to very choice.

FRESH FRUITS.—Exports of apples for week, 1,650 bbls. The stock of apples is almost out of store, and railroad receipts in good order are firm.

Extra Baldwins and Greenings $4.50@5; other $2.50@3.50; russets, $1 75@3.25. Strawberries have taken higher, owing to diminished receipts. North Carolinas are poor as a rule, quoted 25@60c. ₱ qt.; Chas., best, 40@50c.; poor, 15@25c.; Fla., 15@30c. Cranberries, $3 75@4 50 ₱ crate. Quotations for Fla. oranges are no longer of use to producers, as no more commercial parcels are to come. Peanuts quiet but hold last prices; Va. hand-picked 5¾@6c.; extra prime, 5¼@5½c.; good to prime, 4¾@5¼c.; shelled, 5½@6c. Hickory nuts, 90c @$1.

FURS AND SKINS.—Reports from the German sale have not had any favorable influence on the market here. Muskrat, a special shipment from this to the German market, sold at a bad decline. The domestic market is unsettled especially for late caught skins, and future business with shippers even for best furs will have to be made giving them a fair margin for carrying over.

GRAIN.—Wheat is freely offered and is lower latest sales are of No. 1 white at $1.29@1.30, no. April at $1.27¾@1.28¼; do., May, at $1.25@1.26¾; No. 1 white at $1.24; ungraded white at $1 25; No. 2 red at $1.32@1.33, do., do. April option, at $1.32@1.33½; do., May at $1.29@1 30,do. June at $1.26½@1.27½; No. 3 red at $1.24; ungraded red at $1.24@$1.30; ungraded Minnesota spring at $1.26 in store. Rye is quiet at 90c. for prime State, afloat. Corn is at a decline and moderately active; latest sales of New York No. 2, at 52@53½c.; do., April, at 50¾@51c.; do., May, at 46¾@46¾c.; do., June, at 46½c.; New York steamer mixed at 51¾@51¾c.; do.; April at 50¾c.; ungraded mixed Western at 51@53c.; New York yellow at 54¾c. Oats are fairly active and prices easy sales of No. 1 white 50c.; No. 2 white at 46@47c.; No. 3 white at 43½@44c.; New York No. 1 at 41¾c.; New York No. 2 at 40@41¾c.; do., May, at 38c.; No. 3 at 40c.; ungraded white Western at 45@48c.; ungraded mixed Western at 40@42c.; white State at 47@51¾c.; mixed State at 41@42c.; No. 2 Chicago at 41¾c.

HAY AND STRAW.—Offerings are fair but demand good and prices steady.

Shipping hay quoted at 70c.; retail lots at 80@85c. for medium, and 85@$1, for better qualities; clover, 55@60. Straw at $1@1.05 for long rye; 65@70c. for short rye, and 50@60c. for oat.

Exports for week, 1,590 bales.

HOPS.—Trade continues slack and prices are unchanged. Quotations are for

	Cents per ℔.
New York, fancy	Nominal.
New York, new crop, good and choice	33 @30
New York, new crop, medium	31 @33
New York, new crop, low to fair	27 @29
Eastern, new crop	27 @35
Wisconsin, new crop	27 @35
Yearlings	7 @18
Olds, all growths	4 @10
Pacific Coast, new	30 @35
Pacific Coast olds (nominal)	5 @10

MILK.—Prices paid to farmers for March were 2¼@2¾c.

MAPLE SUGAR.—Demand good at 11@13½c. for cakes: refined Brattleboro, Vermont, exceeds these prices. Syrup, 75@$1 ₱ gal., in tin.

POULTRY AND GAME—Ordinary fresh-killed poultry has had a slow sale and the season is about over for shipments from remote points. Frozen poultry has lost its steady demand, chickens selling as low as 10c.; a few lots of fancy Vermont turkeys have made 20c. The trade, however, will soon run into its regular spring channel for near-point dressed such as Penn. and some shipments of N. J. stock.

Turkeys, choice, small, 14@15c.; medium, 13@14c.; fair to good, small, 13@13c; large, 10@12c.; Phila., dry-picked, 14@16c.; capons, Phila. large, 24@26c.; small, 22@25c.; slips, 18@20c.; chickens, winter, large, Phila., 2@2.50; small, 30@35c.; spring, per lb., 40@45c.; fall, Phila., d.-p., 18@20c.; yearling, Phila., d.-p., 14@16c.; Jersey, ₱ lb., 12@13c.; fowls, Phila., d.-p., 11@13c.; Jersey, good to prime, 11@12c.; State good to prime, 12@13c.; Western, good to prime, 10@12c., poor to fair, 8@10c. Ducks, Phila. d.-p., 18@19c.; Jersey, 11@13c.; State, 15@16c.; Western, 11@12c.; Western, poor, 10@12c.; squabs, white, ₱ doz., $2.50@3; dark, $1.25@1.75.

Live poultry are in moderate supply and bring fair prices. A few Southern coops have brought 11c. Turkeys barely steady.

Chickens, spring, large, per pair, 75c.@$1; small, 40@45c.; fowls, Jersey, 12c.; Western, 11@12c.; roosters, 5@6c.; turkeys, mixed, 11@12c.; ducks, Jersey, N. Y. & Pa., per pair, 75c@$1; Western, 60@75c.; geese, Jersey, $1 75@2; N. Y. & Pa., $1.50@1.75; Western, mixed, $1.12@1.37; pigeons, 35@45c

Wild ducks have no decided price; buyers have dropped them on account of poor quality. We seldom sell up to May. The feature of the week is abundant supply of pigeons; prime, including Penn., 75c; poor, 50c.; Eng. snipe and plover, $1 50@1.75; sand snipe, 35@40c.

PROVISIONS—Have been freely offered at lower prices. Pork quoted at for new for April at $10.50; May at $10.50, and June at $10.57@10 60; July at $10.60@10.70. Bacon at 6¾ for long clear and 7¾ for short clear. Lard—Western steam at 7.20 for spot lots, 7.20@7.22½ for May; 7.27 for April; 7.27½ for June. Stearine at 7½c. for prime. Beef—Extra India mess at $18@20 for city and $19 for Philadelphia and at $ 0.50@11 for extra mess, and $10 for plain mess. Tallow at 6.1-16 for prime.

Receipts for week, pork, 1,500 bbls.; beef, 250 pkgs.; cut-meats, 25,950 pkgs; lard 24,850 pkgs. Exports for do., pork, 4,500 bbls.; beef, 3,305 pkgs.; bacon, hams and shoulders, 9,705,850 lbs.; lard, 7,202,500 lbs.

SEED.—Clover is weak at 6¾@7¾c. for Western and 7¾@8c. for State.

VEGETABLES.—Exports for week, 925 bbls potatoes. Low prices are the rule of potatoes this spring; it is too late for holders of even fine qualities to expect a turn in their favor. Prime new have fair demand.

Bermuda, new ₱ bbl. $5 50@6 50; Florida, new, Rose, $3@6, Cant lied, $5@4 50; culls, $2.25@3; early Rose, N. S., bulk, $ .90@1.07. Maine, per 7-8-h. bbl., $1.75; State, $1,20@1.10; in bulk ₱ bbl. $1.25@1.50; prolific N. S. per 7-8-h. bbl. $1.20@1.37; in bulk $1.20@1.37; Mercer, bulk, ₱ bbl. $1.05@1.12; Chili Red, bulk, ₱ bbl, $1@1.12; Peachblow, State, white, per 7-8-h.bbl., $1,50@1.75; red, $1.37@1.50; Snowflake, State, $1.30@1.75; Peerless, State, $1.00@$1.12; bulk, $1; Jersey, bulk, 50@75c.; Sweet potatoes, ₱ bbl. $3. Green stuff has a fair demand but quotations prevent a large movement. The assortment is not attractive and that fact will promote business when the weather becomes settled. Carrots scarce and wanted. Tomatoes, Fla., ₱ bu., $2@4.50. Nassau, box 500.@$1. Bermuda, 70@90 c.; beets Bermuda, new, ₱ crate; Fla., $ .75@2.50; cucumbers, Fla., $2.50 @4; wax beans, Fla., $3@2 50; string beans, Florida, round, 2@$2.50; flat, $1.50@2; squash, Fla., white, $1@1.50; green peas, N. C., ½ bbl. crate, $1.50@5, Chas. and Sav., small, $2@2 50; large, $2@2.50; asparagus, Norf., ₱ per doz. bchs. $3@5.50; Chas., ₱ doz. bchs $3@5; kale, Norf., ₱ bu., 60c.@$1.25; Baltimore, per bag, 40@60c.; kale, L. I. ₱ bbl., $1@1.50; spinach, Norf., $2.50@3.50; Baltimore, $2.00@2.50 radishes, Norf., round ₱ 100 bunches, 50c.@$1.25 long, $1@1.25; squash, marrow, per bbl., $1.75@2; rhubarb, $1.75@2; cabbage, Ch'n and Sav., $4.50@5; Fla., new, $4.50@5; onions Bermuda, new ₱ crate, $2 25@2.50; white, ₱ bbl., $4.50@5.50; yellow, $4.50@5.00; red, Eastern, $4.00@5; beets, ₱ bbl., $1.50@2; turnips, Russia, 75c.@$1.25; carrots, $1 25@1.75. Hot-house products—Cucumbers, selected, ₱ doz., $2@2.25; do., seconds and culls, 75c @$1.50; radishes, ₱ 100 bunches, $2@2.50; rhubarb, $5@7; lettuce, extra, ₱ doz., 50@75c.; fair to good, 25@50c; carrots, ₱ 100 bunches, $5@6.

WOOL.—The market is much quieter and there is a weak feeling, more particulary on fine grades. Latest sales are of X and XX and above Ohio at 54@55c.; Iowa at 38—40c.; Mediterranean at 16c.; scoured California at 58@62c.; fall California at 27c.; Cape at 54@57c.; Montevideo at 50c.; Western Texas at 29@30c.; Territory at 32@36c.; Oregon at 45c.

LIVE STOCK MARKETS.

NEW YORK, Saturday, April 17, 1880.

BEEVES.—Receipts for week, 13,101 head; do. last week, 9,244 do. A steady trade has ruled most of the week; prices worked up in the early part of it, as the weather was cold and favorable for butchers. Since Wednesday the dressed beef market has become dull and buying was not sharp at the prices, but a fair trade resulted by the close of yesterday at the following prices. Among the offerings was a 12-car lot of fair Texas stillers, which sold at 8¾@9c.; 7 cars of Colorado and native stillers, mixed, at 8¾@9¼c., to dress 58 ℔, and 4 loads of Ohio stillers, at 9c., less 50c. each. A few rough oxen and thin steers were sold as low as 7¾@8c., to dress 55 ℔, but common to fair steers brought from 8½c. to 9c., to dress 56@60 ℔, with good to choice at 9¾@10¼c., to dress 56 pounds—latter price for two car-loads for export alive. Fat corn-fed and distillery-fed bulls were sold at 3¾@4¼c., live weight.

COWS AND CALVES.—Receipts were light and not of attractive quality, few selling above $40 and $50 is quoted for some. At this part of the year a number of good milkers would find purchasers, but the call for new butter, especially this spring, will be apt to keep good stock in the country. Good to prime fresh cows would realize $50@60 per head.

VEAL CALVES.—The market has suffered one of the surfeits incident to spring, and prices have ruled unprofitably low. Hog-dressed have lost most, and this week ought to wind up the shipments, as butchers can supply the wants of trade. Live calves, N. J. and Bucks Co., choice, 7c.; prime, 6@6½c.; State, choice, 6c.; do. prime, 5½@6c.; fair to good, 5@5½c.; poor, 3@4¼c.; Mt. Holly, good to choice, 6@7¼c.; buttermilk, 3@4c.; grass, 2½@3c.; hog-dressed, N. J., choice, 8@9c; good to prime, 7@8c.; State, good to choice, 7@8c.; fair to good, 6@7c.; poor to fair, 3@5c.

SHEEP AND LAMBS—Receipts for week, 23,111 head; do. last week, 17,963 do. Sheep have also had a dragging week. The following were full prices at the close. Sheep at 6@7½c., with a load of prime Michigan at $7.35. A car-load of coarse Illinois clipped sheep were sold at $4.75@4.62½ ₱ ℔., a small lot of common Ohio do., at $4 80, and a deck-load of prime do. at 5¾c. ₱ ℔. Some unshorn yearling lambs were sold at 8¾@8¾c., a few clipped do. at 6c., and a number of spring lambs at $5@5 50 ₱ head.

SWINE.—Receipts for week, 34,100 head; do. last week, 30 207 do. Live dull at 4½@4¾c.

Country-dressed pork is looming its regular call, with warmer weather. Light weight, 7@7¼c.; medium, 6¾@7c.; heavy, 6@6¼c., city dressed quoted on change, 5¾@6¾c.

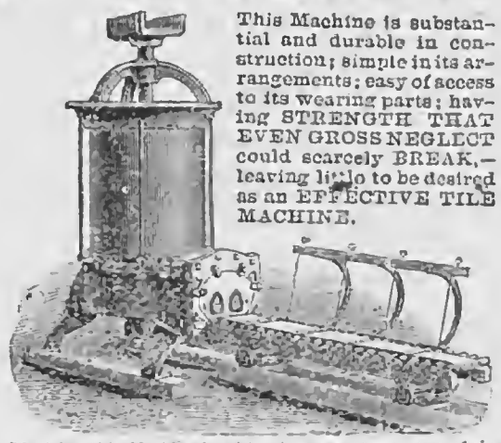
SALT is NECESSARY for LAND

Fruit Trees, &c. **LUMP SALT** is excellent for horses, sheep, &c. All kinds of salt in full supply; also, Ferris' **Land Invigorator and Crop Protector**—death to **Hessian Fly** and other pests. Use it and reap a golden harvest.

EDWIN FERRIS & CO.,
Wholesale Salt & Fish Dealer 183 & 185 Washington St., N. Y.

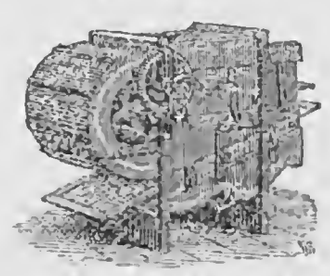
Eureka **Drain Tile** Machine



This Machine is substantial and durable in construction; simple in its arrangements; easy of access to its wearing parts; having STRENGTH THAT EVEN GROSS NEGLECT could scarcely BREAK,—leaving little to be desired as an EFFECTIVE TILE MACHINE.

We drive this Machine by either horse or steam power, being well suited to either. Our Tile dies range in size from 3 to 9 ins. in diameter; and in shape we vary them to suit the taste of customers. As a Brick Machine it is also a complete success. It is fully warranted as a Tile or Brick Machine. Send for circular.
CHANDLER & TAYLOR, Indianapolis, Ind.

The "Centennial" Fanning Mill.



The best mill in the world. It separates Oats, Cockle, and all foul stuff from wheat. Is also a perfect cleaner of Flax, Timothy, Clover and all kinds of seeds. The great improvement over other mills is that it has two shoes. It is especially adapted for warehouse use. Send for Descriptive Circular and Price List. Liberal discount to dealers. Address,
S. FREEMAN & SON, Racine, Wis.

Trade **LONDON PURPLE.** Mark.

Valuable insecticide for the extermination of the COLORADO BEETLE, COTTON WORM and CANKER WORM. For Prices, Circulars and opinions write.

HEMINGWAY'S LONDON PURPLE COMPANY, (Limited) 90 Water St., New York.

Professor C. V. Riley says: London Purple can be more effectually sprinkled or sprayed on to the plant than Paris-green, by virtue of its greater fineness.

Professor C. E. Bessey says; It promises to be a most excellent remedy. It quickly kills both the Larva and the Winged Insects.

Professor J. L. Budd says: A single application placed every one of the pests on their backs over the ground, either dead or in a dying condition, in less than six hours.

THE BELCHER & TAYLOR AG'L TOOL CO.

Manufacture this Plow of the *best Car Wheel Iron*; also of *Patent Hard Metal*. The handles vibrating from one side to the other as the plow is turned at the end of the furrow, enables the plowman to walk squarely behind the plow—a feature not possessed by any other Side-Hill Plow. It does as good work as any Land-Side Plow. For further particulars and prices send for our new *Illustrated Catalogue*. Address

GEO. S. TAYLOR, Agent,
Chicopee Falls, Mass.

CHALLENGE WIND MILLS

Victorious at all fairs. Over 7,000 in actual use in every State and Territory of the U. S. It is a suction wheel—has been made by the present Co. for ten years; in all that time not one has blown down without tower breaking—a record no other mill can show. We leave it to the public to determine their merit. Mills sent on 30 days' trial. Best Feed Mills, Corn Shellers, &c., &c. Catalogue free.

BAUGH & SONS,
20 So. Del. Ave., Philadelphia.
103 South St. Baltimore.

STOCKBRIDGE MANURES For 1880.

Some years ago the Stockbridge Manures were only known to a few farmers in the Connecticut Valley. Now they are so extensively used in different parts of the country as to require two large factories, one in New York and one in Boston to manufacture them. This increase shows what farmers think of good fertilizers, and is not only due to the fact that they are reliable, well-made, and high-grade manures, but also to the fact that farmers have

FOUND THEM PROFITABLE TO USE.

Now that corn, and other farm produce is bringing such good prices, we anticipate that farmers will invest still more largely in our fertilizers.

Besides the Stockbridge Manures, we manufacture several high-grade Phosphates, and deal in first-class chemicals of all kinds. Farmers who intend to use Fertilizers of any kind, should

FALL CREEK AND ITS PAPER MILLS.

NETTIE NORTHWOOD.

I HAVE lived all of my life within twenty miles of Fall Creek, and, until last summer, have never visited its falls or paper mills.

One warm morning in haying time F. came in and said that a part of the mowing-machine was broken, and as it could not be repaired short of the Ithaca manufactory, he must take one of the horses and the lightest wagon and start immediately. I petitioned to go, but they were all horrified at the thought of my riding forty miles in an open buggy that warm day.

But after the usual amount of coaxing I obtained permission, and, after giving out orders for a picnic dinner, hurriedly dressed and was ready by the time that F. drove up. Mamma came out with a lunch neatly packed, and in less than half an hour from the time we decided to go Trotter was whirling us over the road at his finest pace.

Our ride was mostly through a thickly settled, well cultivated and beautiful country. We could see hills in every direction. One large, though not high hill, could be seen several miles distant. At first it seemed to be before us, but gradually it moved to our left and finally disappeared. It was thickly settled, and its side was covered with fields of grain, beautiful meadows and groves of trees, the different shades of which combined to make it very beautiful. The farm-houses and barns could be distinctly seen. It seemed the veritable abode of peace and plenty.

We reached Ithaca soon after noon, having made the twenty miles in three hours and a half. F. transacted his business and then drove to the falls. The last fall is visible from the bridge, and while I was admiring it F. saw that Trotter was properly cared for, and then we began to climb the cliffs to obtain a view of the next fall. It is more beautiful than pen can describe, foamy and fleecy as a bridal veil. I do not know how far the water falls, but it must be more than a hundred feet, and the river is quite wide. We soon found that climbing over the rocks was a laborious task, which put a keen edge to our appetites, and accordingly we decided to eat our lunch at the end of the tunnel.

To reach the tunnel we were obliged to retrace our path, go through a large building, up a flight of steps, then follow an ascending path a short distance, when finally we were at the mouth of the tunnel.

This tunnel was blasted out of the solid rock, to let the water through that supplies the motive power for the paper, flouring, and various other mills. It is about twenty feet deep and between fifteen and sixteen rods long. There are spoils driven the entire length, timbers laid across, and on them a walk three planks wide. We enter, and over our heads and on either side, is one solid mass of rock, jagged and rough. In some places on the sides were niches large enough for statues. Under our feet ran the dark waters. The tunnel is slightly curved and for a time all is dark ahead, but soon a little light appears and grows larger until we are at the end. Half way across the opening is a wall of masonry, that rises about four feet above the walk. The other half of the opening is filled by the head gate, for this is the beginning of the flume. There are stones projecting from the wall which answer for stairs, and we climb to the top.

Before us lies a large pond. Far up and a little to the right, is another fall, resembling a mammoth snowbank. All around are cliffs, more than a hundred feet high, rough, rocky, tree-capped and nearly perpendicular.

The cliffs and the falls are in form of a horse-shoe, enclosing the pond. The opening is the dam. It is at our left nearly semi-circular in form, and, I think, about twelve feet high. F. tells me that it was once a little fall, but art has capped it with layers of board, that stones riveted down with iron rods.

The water was quite low and I walked nearly a third of the way across with as much comfort as though on a stone pavement. There I could get a fine view of the falls above the river below, the cliffs, and in the distance a glimpse of Cayuga Lake. Hunger was forgotten until I espied F. spreading the lunch out on the rocks in *man fashion*, and I felt obliged to go to the rescue. How strange it did seem to sit there with that majestic scene, God's own handiwork, before us. Long would we have been willing to linger; but there were so many places that we wished to visit, that we were obliged to turn away.

Just at the entrance of the tunnel, at the left as you are going in, is a deep chasm; one side is nearly perpendicular, and the other shelving; by giving a little spring from the plank walk we stood on the moss covered rocks. The chasm must be twelve or fifteen feet long, and by going to the end we could see the falls far below us. After making signs on the rocks, to be recognized if we ever revisited the place, we turned, and following the footpath commenced climbing the hill above the tunnel. It is very steep, and we were obliged to catch hold of the bushes and low branches of trees, to keep from sliding backwards, but one look at the falls from its highest point was ample pay for the fatigue of climbing.

While admiring the falls below us, we could see the upper ones so distinctly and it seemed so near that we resolved to visit it. So on we went over logs and rocks, through brushes and grass, until we could hear the roar distinctly, and soon we reached the edge of the cliff where an open view was afforded. The falls were still far up, but instead of one we could now see three falls, one beyond the other, making four in all. There may be more, but we were too tired to explore farther. After resting a short time, and gathering a few mementos, we turned back, carrying with us a grand picture to hang on "Memory's wall."

On reaching our starting place we found that we had another hour, and concluded that the most profitable way of spending it would be to visit the paper mills. Descending a short flight of steps we entered an upper room of the brown paper mill. It is a storage room containing enormous piles of rags in brown canvas sacks. I will not mention the rooms in the order we visited them, but will tell, as nearly as I could discover, the course the rags take from the time they enter the mill in rag-bags until, in the form of neat packages of paper, they leave to visit the world. Several women and girls are employed in picking over rags. Before each is a table frame covered with wire cloth; on this the rags are piled, and as they are shaken, cut and sorted to make the various grades of paper, the dust and lint fall into a large wooden box underneath. The coarse, colored rags are sent to another mill to make brown paper.

When thus picked over they are ground in a mill, then placed in a huge, revolving cylinder, where they are thoroughly steamed and cleansed, with acid. They are next placed in a beating engine—a vat with straight sides and circular ends lined with lead. Near one end is a partition, and on one side of the partition is a large, octagonal wheel which rubs the rags as they pass under. On the other side is a wheel studded with cutters which revolves above a block also filled with cutters. The vat is filled with water and the machinery set in motion; and the rags pass round and round, alternately under the wheel and between the cutters until they are reduced to a pulp. The rags for the finer quality of paper pass through two or three of these engines

Passing on, we enter one of the rolling rooms. The rollers are about eight feet in length, and are alternately one, and two feet in diameter; they are in tiers nearly as high as one's head and several feet long. There are two sets, one beyond the the other; the first is covered with felt bands nearly as wide as the rollers.

At the end of the room is a shallow vat from which a continuous stream of fluid pulp is running upon the moving felt band that covers the rollers; it immediately passes under two or three rollers, and in a moment the water is all squeezed out leaving a thin paste on the band. It passes up and down, over and under heated rollers, and comes out at the end, and without the band passes to the next set of rollers where it is dried and polished and at the end comes out cut into sheets of paper. Two ladies one on each sides lay it smoothly as it falls, throwing away the damaged sheets. As soon as the piles are high enough they are carried into another room, sorted, counted, and tied up into packages ready for market. We visited the other rolling rooms but the different grades of paper appear to be rolled out in the same manner.

We reached home late in the evening, tired from the day's exertions. Though I, for two or three days felt tired and lame from my long ride and cliff climbing, still I felt well paid, and think I shall never see a bit of paper without recalling its history.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—I received my seed; there were six kinds, four kinds of flower seeds and two of vegetables. I am very much pleased with them, and I hope I will have better success with them this year than last year. I tried hard enough then, but grubs, bugs and chickens had more time than I, they worked while I was at school, and did not stop to sleep nights, I guess. I've been coaxing my cousin to join the club, but he hates to write so badly. He is very much interested in the letters of the cousins. I gave him some of my radish seeds last year, and he raised some very nice ones. I think his did better than mine. I might send on his name, if it would do for me to offer it, but I'll not promise to report for him every time, so I guess he will have to wait until he is willing to write for himself. My brother fenced off a piece of land for a berry garden last fall, and set out strawberries and blackcaps, he has but two of red raspberries, and they are the Cuthbert that he received from the RURAL. He inteuds to keep setting out till he has the garden full. We have beautiful cherries, pears, plums, peaches and apples, in the time for them. With many thanks for the seeds, I remain your loving niece, BERTHA H.

West Town, N. Y.

DEAR UNCLE MARK:—Although I was kept pretty busy with other things last year, I found a little spare time occasionally to work in the garden. The radishes which you sent me were excellent and I saved some seed for this year. The dwarf corn came too late to ripen, but I did not plant it all, so there will be enough left for another trial. Only one of the grape seeds came up. It has been in the house all winter but is so sickly that it will undoubtedly die. I received a package of seeds from you a short time ago, for which please accept my thanks. Some of the young lady cousins seem determined to start up a row in the family. I think they had better flourish the mop and dish-rag instead of a quarrelsome pen. From the way that the daughters of Eve are gaining power it seems highly probable that they will yet bring destruction upon us poor, helpless fellows.

West Salem, Wis. PEACEABLE BOB.

DEAR UNCLE MARK:—I am a boy eleven years old and a reader of your valuable paper, and read the letters in the Youth's Department. I thought I would write and tell you what I captured. While out hauling stone the other day, we came to a hole in the ground and looking in I discovered a large woodchuck. The freezing and thawing of the winter had caused the ground to cave in. My older brother reached in and pulled the woodchuck out. He had not awakened yet and was cold and almost motionless. I took him in my arms and carried him home and put him in a box. Here he woke up in about an hour, and was as spry as in the summer; but he was too wide awake for me; after a while he raised the lid and was again free. JOHN W. HESS.

Miscellaneous.

BRIEFLETS.

ACH. POINCELOT: The greatest merit of many husbands is their wives. . . ROCHEBRUN: When you talk to women, you must choose between lying and displeasing them. There is no middle course, unless you say nothing. . . NINON DE L'ENCLOS: Women detest a jealous man whom they do not love, but it angers them when a man whom they do love is not jealous. . . "Turnips," says Mr. Harris, "may be divided into two distinct classes. We may designate them as early and late. In England the first class is called 'common turnips" and the latter 'Swede turnips.' With us, the Swede turnips are called Rutabagas." . . For summer use select a piece of rich, mellow, well-drained but moist soil. Sow on it two pounds of superphosphate to the square rod and drill in the seed in rows fifteen inches apart and four or five seeds to the inch. It is necessary to sow very thick on account of the ravages of the black beetle or "turnip fly." Thick sowing and the use of superphosphate are the best remedies for this pest. . . When the plants get into the rough leaf, the danger from the beetle is about over. Then thin out the plants with a hoe, leaving only one plant in a place seven or eight inches apart. Hoe frequently and keep out the weeds, and that is all that is necessary to insure a crop. . . Mr. T. Blake reminds Englishmen that the men who fight the wars are not the men who make the quarrels. If those who make the quarrels were but to fight them out themselves, we should have, he thinks, but few wars. Everything that adds to the war spirit of the country — as their immense outlay in armaments does — is a national curse. . . A movement for organizing a school of instruction in silk culture for ladies has been started in Philadelphia. . . Mr. Dodge will show in his farm story for the RURAL, how a woman can be a help to a man in his achievement of success, without the necessity of making a mere drudge of herself. . . All things considered, what is the best Currant? Our answer would be the old Red Dutch. . . By actual weight and measurement, Mr. Barry has found the Waterloo peach to exceed in size all the very early peaches which he has tested. . . The editor of the Germantown Telegraph has a number of dwarf pear trees now bearing full crops annually, that he planted 32 years ago, and he sees no reason why they should not continue to live and bear at least ten years longer. . . The New York Times makes the considerable mistake of recommending the Tom Thumb as the best early pea. . . Ah, it is a sweet thing to get close to a trusting, loving heart! But oh, it is an awful thing to get there and then betray it! . . "If I were blessed with daughters," says a writer in London Truth, "I should seek out an Irish nurse for them, and insist upon her smoking every day in the nursery a certain amount of the strongest tobacco from a short clay pipe. In after years, my daughters would not render themselves objectionable to the male sex in general, and their father in particular, by declaring that they could not endure the odor of a cigar or a cigarette." . . It may not be so in the planet Jupiter, but on this little earth it is easier for a rich man who has all the vices of the calendar to get a beautiful wife, supplemented after a few years of mutual misery by a divorce, than for a poor man who has all the virtues ever dreamed of to get married at all. . . The Gardeners' Chronicle, we are glad to see, makes liberal extracts from Mr. H. B. Ellwanger's interesting address on American Roses. . . Let us have peas. . . April 12. Freezing weather is reported from the mountains of Western North Carolina. . . Mr. Warner says that he likes neighbors and he likes chickens, but he does not think they ought to be united near a garden. "Even if the hens did not scratch up the corn and peck the strawberries and eat the tomatoes, it is not pleasant to see them straddling about in their jerky, high-stepping, speculative manner, pecking inquisitively here and there." . . It is of no use to tell the neighbor that his hens eat your tomatoes; it makes no impression upon him, for the tomatoes are not his. The best way is to casually remark to him that he has a fine lot of chickens and that you like them broiled. Then he will take them away. . . Press the soil *firmly* about transplanted trees. It is better to *ram* the soil over the roots than to leave it loose. Do not plant trees or shrubs or plants of *any* kind deep. The roots should be as near the surface as is consistent with their being permanently covered with soil. . . It appears that English nurserymen are cultivating our Poison Ivy or Oak (Rhus Toxicodendron) under the name of Ampelopsis Japonica. . . The interesting series of essays upon small fruits by E. P. Roe, beautifully illustrated and published in Scribner, are—Mr. Roe informs us—to be printed in book form with all of the illustrations and double the amount of reading matter. . . One man living in Kingston, N. Y. (says the N. Y. Tribune), who had lost three children suddenly, sent a sample of his well water to a chemist, who found in it "a large percentage of poison," the "juice of manure filtered through the soil." . . Mr. Warner also says that the neighbors' small children as well as neighbors' chickens, are out of place in your garden, in strawberry and currant time. "I hope I appreciate the value of children" he says. "We should soon come to nothing without them, though the shakers have the best gardens in the world(!). But the problem is what to do with them in a garden. For they are not good to eat and there is a law against making away with them. The law is not very well enforced it is true; for people do thin them out with constant dosing, paregoric and soothing-sirup and scanty clothing. . . My plan would be to put them (the children) into Sunday schools more thoroughly, and to give the Sunday schools an agricultural turn—teaching the children the sacredness of neighbors' vegetables." . . Mr. Warner thinks that our Sunday schools do not sufficently impress upon children the danger from snakes and otherwise of going into the neighbors' gardens. . . We should be pleased to learn at what time Moore's Early Grape ripens in different parts of the country where it has been tested. . . Mr. Batcham's observation lead him to believe that grape-rot is not the result of diseased or weakened vines, but of peculiar hygrometrical and thermal conditions which act upon vegetable tissues. Mr. Meehan believes Mr. Batcham to be wholly correct. . . The Winter Nells is said sometimes to weigh half a pound in California when raised upon Quince tock. . . Mr. Hussman, writing for the ural World, speaks of a visit to the vineyard of Mr. Ricketts. He expected to find that the vines were pampered and petted, but found the reverse. They were poorly cultivated, pruned long, and usually bore an excessive crop etc. . .

PERSONAL ITEMS.

Senator McPherson, of New Jersey, made his money at cattle dealing.

Congressman Newberry is now president of thirty-five manufacturing companies.

Hart, the colored winner of the latest walking match, proposes to study law in Boston.

The ex-empress Eugene has arrived safely at the Cape of Good Hope on her pilgrimage to the scene of her son's death in Zululand.

Anna and Teresa Goldoni, aged respectively 84 and 86, lineal descendants of the great Italian dramatist, are inmates of an almshouse in Venice.

Mrs. Hennan, the maternal godmother of Gen. Hood's orphans, died suddenly a few days ago in New Orleans, and the little ones have thus been deprived of their only natural protector.

Increasing Use of Compound Oxygen by Physicians.

A large and steadily increasing number of intelligent physicians in all parts of the country are using Compound Oxygen in Chronic Cases which they have not been able to cure with ordinary remedies. Writes one: "I shall make the Oxygen Treatment a prominent feature in my practice, for *I have tested it sufficiently to satisfy me of its merits.*" Says another: "I do know that my patient is *a hundred per cent better*, and is gaining rapidly. His left lung was *almost consolidated*, but *is now free, except in one small spot.*" Another physician who used it in his own case, says: "I was relieved, the first time I used it, of a *very severe catarrh trouble*; and *my lung trouble promises to be a thing of the past.*" Writes another; "I am thoroughly convinced that the Compound Oxygen *is what we need in a vast army of Chronic Diseases.*" We could give columns of extracts from our correspondence with physicians who are using this new Treatment, all of the same tenor. If you wish to know what Compound Oxgen is, and what it cures, send for our Treatise on its Nature, Action, and Results. *It will be mailed free.* Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.

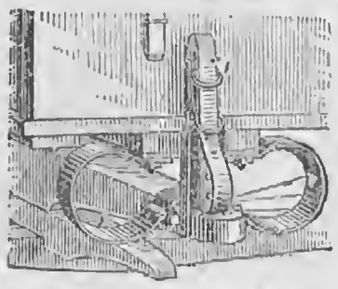
SOMETHING NEW!

PULLIAM'S PATENT

BOLSTERS SPRINGS for FARM WAGONS.



This valuable device is suited to wagons of any size—made of the best steel and warranted—are attached by four bolts through the bed—can be put on by any person. They remain on the wagon for all uses and work equally well whether with empty or loaded wagon. There is no use for a spring seat—they make a comfortable spring wagon out of a farm wagon—and save largely in wear and tear. We want Agents everywhere. Send for description and prices, and mention this paper.

SEMPLE & BIRGE MFG. CO., St. Louis, Mo.

INGALL'S PAT. LINK AND CHAIN

Will make or mend your chains, of all sizes, without tools. Inquire at your Hardware store or address

INGALL'S MFG. CO., Providence, R. I.

MINNESOTA CHIEF!

The Best Thresher on Wheels!

It is not a vibrator, neither is it an apron machine, but the best points of both are combined, with new and original features of its own. It is wonderfully simple in its arrangement. It is admirably perfect in its threshing and separating qualities. It saves all the grain, and cleans it ready for market. It runs easily, is constructed durably, is finished beautifully, is the most economical, least expensive, and altogether the most satisfactory machine in the market.

It will handle wet grain as well as dry. In threshing Flax and Timothy it has no equal, threshing and cleaning both as well, and nearly as rapidly, as wheat, and requires no change except the sieves. It has more square feet of separating and cleaning surface than any other machine made, and cannot be overloaded. It is both over and under blast at the same time.

Our clover hulling attachment is a new and very desirable feature. It does the business more rapidly and better than an exclusively clover hulling machine.

Separators of the various sizes fitted for Steam or Horse-Power, as desired.

An Improved Pitts Power, an Improved Woodbury Power, and the Elward Equalizing Power, all mounted on four wheels, are manufactured by us, and are not surpassed by any in the market.

For Price-Lists and Circulars, address the manu'frs.

FISK'S AUTOMATIC SEED PLANTER

Has the best improvements of any Hand Planter now in use. Plants with the accuracy of a hoe all the ground a person can walk over in a day. Seed for each hill passes in plain sight.

This is the easiest planter to use ever invented. Every planter fully warranted, and satisfaction guaranteed. Unusual inducements on samples this season. Circulars free.

WALLACE FISK, South Byron, Genesee Co., N. Y.

THE FERGUSON BUREAU CREAMERY.

Surpasses all others in quantity and quality of butter made. It secures matured and ripened cream, which makes butter of the best texture, flavor, and of unequaled keeping quality. It excludes flies, dust and odors; is constantly at the correct temperature (55° to 60°); has room for the cream and butter, and saves three-fourths the labor. It can be used with either ice or water, and both summer and winter.

THE FERGUSON CONCUSSION CHURN is the best. It combines scientific principles with the best labor saving devices. No floats or paddles. Brings the butter in granular form, and secures the largest yield. Befor buying any other Churn or Creamer; or any pans, or cans, send for large illustrated circular to THE FERGUSON MF'G CO., Burlington, Vt. Reliable Agents Wanted.

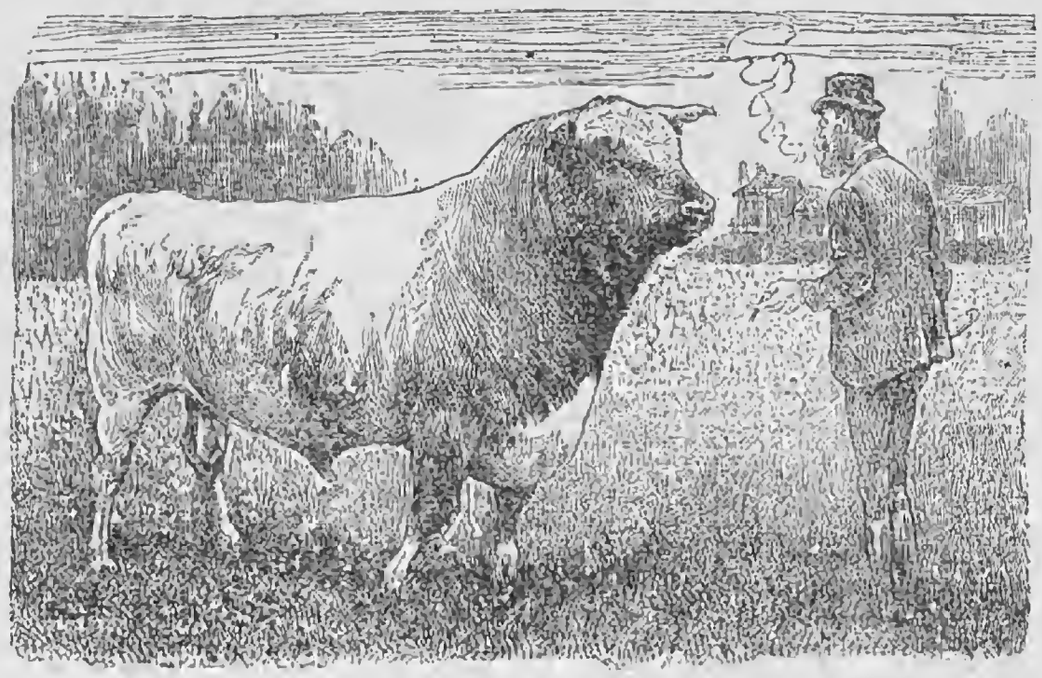
Humorous.

BRIGHAM YOUNG'S widow is gradually forgetting the old man. Four of her has re-married since he died.

MRS. BROWN says her husband is such a blunderer that he can't even try on a new boot without putting his foot in it.

The Foundation of Health.

Without a substratum, a foundation of vigor, there can be no true health. The puny and the weak have all sorts of aches and pains, not necessarily because they are positively diseased, but because the vital machinery hitches and halts for want of the impetus which abundant vitality would give it. The blood-enriching tonic, Hostetter's Stomach Bitters supplies deficient energy by enabling the stomach to perform its digestive functions actively and uninterruptedly. The result of this is the distribution of stores of vitality to the remotest parts of the system, an increase of muscular energy and the disappearance of those nervous symptoms which accompany and proceed from debility, irregularity of the bowels, torpidity of the liver, rheumatic ailment and malarial fevers are prominent among the actual diseases eradicated by this signally efficacious medicine.



DANDY—(much interested in cattle)—Well, you're a splendid fellow, ar'n't you?"
BULL—Yes, and so would you have been, if your parents had been selected with as much care as mine were.

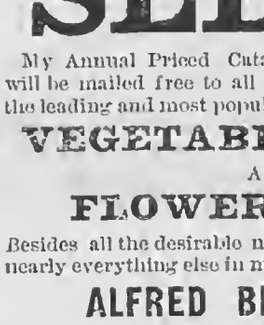
'THOMAS' PORTABLE ENGINE.



This is the lightest, most durable and economical Farm Engine made. It is from 1000 to 1500 lbs. lighter than other engines of the same power. It is warranted in every respect, and on account of improved method of utilizing steam is more economical in fuel and water. It is made especially to meet the wants long felt by Threshermen Farmers, &c., for an engine that would combine lightness with absolute strength and durability. Made in three sizes. Circulars giving full description sent on application to J. H. THOMAS & SONS, Manufacturers, Springfield, O.

THE NEW
BLANCHARD CHURN
THE NEW
We have perfected a *radical* and *valuable* improvement in our celebrated Churn, which needs but to be seen to be appreciated. Now offered for the first time to the dairy public.
It received the HIGHEST PREMIUM at the International Dairy Fair in New York City, in competition with all the leading churns in the market.
Nine sizes made, churning from one to one hundred gallons. Warranted to be exactly as represented.
Send to any dealer in REALLY first-class Farm and Dairy Implements for a Descriptive Circular of "THE NEW BLANCHARD CHURN," or to the Sole Manufacturers, PORTER BLANCHARD'S SONS, Concord, N. H.

PIANOS AND ORGANS
PIANOS $150 TO $400 (with Stool, Cover and Book)—All strictly first-class and sold at Wholesale factory prices. These Pianos made one of the finest displays at the Centennial Exhibition, and were unanimously recommended for the Highest HONORS. The square Grands contain Mathushek's new patent Duplex Overstrung Scale, the greatest improvement in the history of Piano making. The Uprights are the finest in America. Catalogue of 48 pages—mailed free.
JUBILEE ORGANS, the best in the world. An 8 stop organ only $65; 13 stops, $97—with all the latest and best improvements, possessing power, depth, brilliancy and sympathetic quality of tone. Beautiful solo effects and perfect stop action. Solid Walnut cases of beautiful design and elegant finish. Circular free. All Pianos and Organs sent on 15 days' test trial—*freight free if unsatisfactory.* Don't fail to write us before buying. Positively we offer the best bargains. Factory and Warerooms, 57th St. and 10th Ave. SHEET MUSIC at ½ price. Catalogue of 3,000 choice pieces sent for 3c. stamp. Address,

The Vineyard.

THE VERGENNES GRAPE.

GEN. WM. H. NOBLE, BRIDGEPORT, CONN.

THE rapid advance of the American Grape to varieties of great merit is one of the wonders of pomology. Wherever the right method of dealing with its problem of development is reached, success attends. From each gain in better knowledge of its solution we may hope for higher excellence. It has taken the life of man to make the wine grape of the Eastern Hemisphere the joy of the table and the wine press; but trial with our varieties within the half of one of these centuries, offers a luscious choice for viand or vintage. Even after this brief effort, many prefer our own imperfect fruits of the vine to the best foreign grapes. Some seem to think a wine can now be made of its fruitage in delicacy of flavor and age-ripening excellence rivaling the best products of the European vintage.

I have rejoiced with pride over the many new Grapes which the RURAL NEW-YORKER has recently so gracefully noticed. I offer to its readers another which I think the peer of any native seedling. Its portrait, which I send, is far short of that large-bunched excellence which its best specimens warrant. It is the Vergennes Grape. Its name comes from that of the town in Vermont, in one of whose gardens it first grew and bore.

It is a Labrusca and claims all the hardiness, and resistance to the ails and pests of the Grape, which belong to that family. The vine is wonderfully vigorous. When one year old, it makes stout growths of five or six feet. Vines of two years stretch out to 12 and 15 feet; then it ripens all its wood, and matures it, as it grows, into sound, rich, brownish-olive, short-jointed vines, ripened to the very tips of its late fall shoots. It leaves no long stretch of green tendrils to get ripe, if the season is long enough, or to be killed by the frost, if short. It is thus proof against the dead wood which mars so many of our vines, whose frozen sap so hurts the rest of the wood. In short, it is an extra-hardy, short-jointed, fast-growing vine.

I send you two small bunches of the grapes, not as specimens of its best estate, but to prove its excellence and long-keeping quality. The specimens have been kept loosely, in a dry cellar, without any extra care. With anything like the pains which many devote to their grape crop, I think this grape in quality and quantity would keep its place on our table beside the apple; certainly with the last of the long-keeping pears. As you see it now, in the bunches sent you, so it has stood for several years, just shrunk a little from its full contour, and without any nice care or help, kept on till thus late. Its shrinkage has nothing of that wilting and flabby texture, which besets so many fine grapes, like the Concord and Isabella, and even the Catawba and Diana, after a long tarry in the fruit room. Another excellence of this grape is its early maturity; the grapes sent you were picked early in September, at Vergennes, Vermont. They are of a lot that have been picked over and eaten from, ever since they arrived at this place. The Vergennes ripens all its bunches evenly; no green grapes, or parts of bunches are seen in its fruitage, as in some other varieties of excellence. It is not subject to mildew, and therefore holding its leaf, matures its fruit and wood. All its products are ripe for the harvest together. When ripe, the Vergennes glories in a rich bloom. I have never seen a grape that in tinge, at its maturity, so filled the eye with a sense and promise of a luscious fruit. This bloom it holds, like a tinted coating, till it shrinks to a raisin.

The Vergennes boasts another quality long sought in our American grapes—an absence of what we call pulp and core. In this regard it is more like the European grape. It is a meaty grape, tender in flesh clear through. The fitness of the Vergennes for wine has been thoroughly tested. It makes a light-tinted, delicate liquor, with a rich and pleasant bouquet. I think it destined, in this quality, to excel any American grape. I have never seen any old wine made from it; it is too new a grape to have raised crops large enough to define and perfect the quality of its wine by age. In short, for hardiness, vigor of growth, large bounteous fruitage, a luscious fruit of the richest tint of blended pink and purple bloom, for its yield of wine with the most delicate aroma, for its early maturity of wood, and fruit, for its long-keeping quality, lasting in excellence beside the apples on our tables, I think this the equal of any American Grape yet grown. I say this with great tenderness towards all its native rivals.

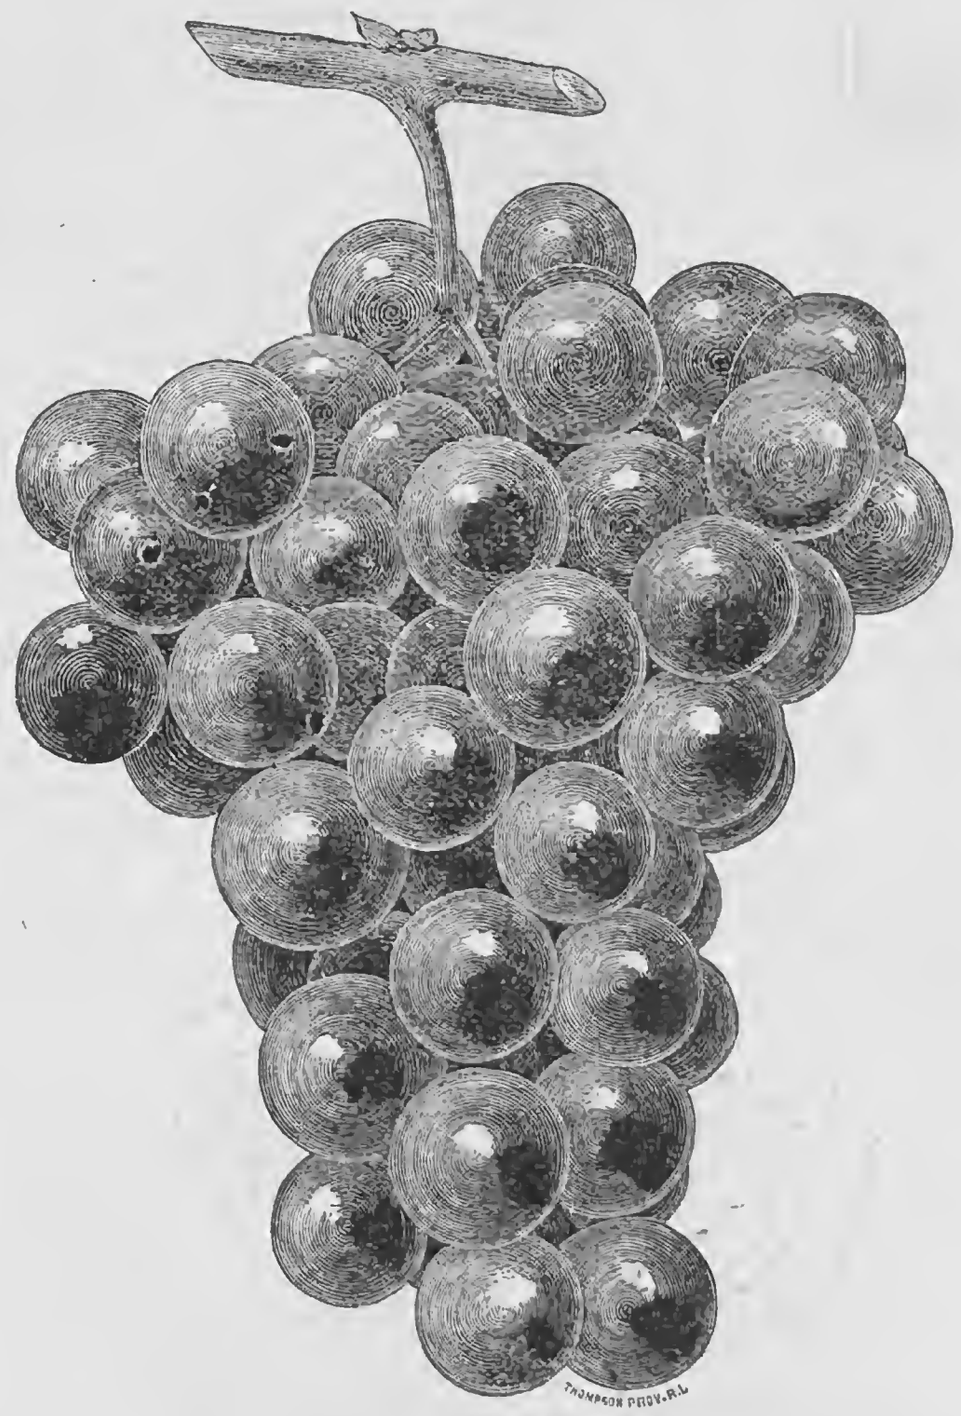
Farm Topics.

HURTFULNESS OF CHLORIDES ON THE TOBACCO CROP.

PROFESSOR F. H. STORER.

IT has been known these 20 years that tobacco which contains an unusually large proportion of chlorine is apt to burn badly; and it has gradually become plain that fertilizers rich in chlorine, such as common salt and muriate of potash, should not be used for this particular crop, because they increase the amount of chlorine in the tobacco leaf and so injure its quality.

In reporting some new experiments, which go to show how important it is for the tobacco-grower to avoid manures that contain chlorides, Adolph Mayer urges that not only should muriate of potash be avoided, and in general, all the ordinary Stassfurt potash-salts of commerce, since they invariably contain a larger or smaller proportion of the chlorides of potassium and sodium, but that there is a choice among animal excrements, even. He explains that night-soil, *i.e.* dung and urine together, such as is obtained from tight cess-pools, contains so considerable a proportion of chlorides that the quality of tobacco may readily be injured by it. In this connection he alludes to the fact of observation that the excessive use of this kind of manure has injured the reputation of the tobacco grown in some parts of the Palatinate, and he considers it proved that the large amount of chlorine in this tobacco is, to say the least, one cause of its inferiority. So, too, the manure obtained by folding sheep (dung and urine together) contains more chlorides than the dung of neat stock; and, in general, the tobacco-grower should take care not to let too much chlorine get into the manure he means to use, either by allowing his stock to eat an excess of salt or in any other way. Where commercial fertilizers are used there ought not to be any difficulty in choosing those which are wholly free from chlorine—a fact easily proved by chemical analysis and to be vouched for by the vendor. Pure sulphate of potash, though somewhat more costly than the ordinary run of potassic fertilizers, can be bought at a price which cannot be deemed high; and, as Mayer says, even saltpeter (nitrate of potash) though sold at a high price as compared with the other potash salts, may well be used to fertilize tobacco, in view of the high price which this crop commands when of good quality. This conclusion had already been reached here in America; some of our most successful farmers being accustomed to use nitrate of potash upon tobacco, in precisely the sense of Mayer's suggestion. It might, perhaps be more economical to use a mixture of sulphate of potash and of nitrate of soda, to replace the nitrate of potash, were it not for the fact that, as now sold, most samples of nitrate of soda are more or less contaminated with common salt. Probably, the best practice of all would be to use the pure sulphate as the chief source of the potash needed by the crop, and to reinforce it with some nitrate of potash, as a means of supplying part of the necessary nitrogenous plant-food. In buying phosphatic fertilizers, such as bone meal; or those containing both phosphates and nitrogen, such as fish-scrap or flesh-meal, it would be well for the tobacco-grower to choose samples which have not been salted for the sake of preserving them.



THE VERGENNES GRAPE.—Fig. 132.

It is to be understood, of course, that the presence of chlorides is not the only cause of tobaccos burning badly. Samples of tobacco well-nigh free from chlorides are sometimes found not to burn well. It is held, indeed, by some manufacturers that the combustibility of tobacco, as well as some of its other qualities, may be influenced to a considerable extent by processes of sweating and fermenting to which the leaves are subjected after the harvest. But it seems to have been well made out not only that chlorides have a very important influence upon the burning of tobacco, but that the grower may control the combustibility of his crop more readily by paying proper attention to the exclusion of chlorides from the fertilizers which he employs than in any other way.

It may here be said that in the old experiments on the combustibility of tobacco it appeared, in general, that tobacco leaves burn well when they contain an abundance of potash in combination with the organic acids natural to the plant, and that they burn badly when they contain chlorides or an inadequate supply of the potash salts aforesaid. In the process of combustion, the organic acids in the tobacco decompose readily at comparatively low temperatures and in case they are in combination with potash one result of the decomposition is the formation of carbonate of potash, which remains in the ashes. It has has been found, indeed, that the proportion of carbonate of potash that can be dissolved out by water from the ashes of different samples of tobacco, affords a tolerably good criterion of the relative combustibility of the several samples. Little or no carbonate of potash can be dissolved from the ashes of those tobaccos which will not burn. The explanation of the matter seems to be that when exposed to heat high enough to calcine and decompose them, these organic salts of potash swell-up and distend in such wise that the tobacco immediately in contact with them is puffed out and converted into finely divided charcoal which, by the mere act of distention, is brought into more intimate contact with the air than it would have been otherwise. So that its combustion is facilitated.

In like manner, tobacco which contains nitrate of potash burns readily, as would naturally have been expected, and it has been urged by some writers that the nitrate is more important in this sense than the organic potash salts. But this idea seems not to have been substantiated; and it has been noticed that too large a proportion of the nitrate is injurious in that it causes cigars to burn more freely and rapidly than is desirable.

The presence of chlorides in the tobacco may, perhaps, tend to lessen the proportion of the desirable organic acids; or it may be that the

chlorides interfere with the intumescence of the organic potash salts at the moment of their decomposition; or, since the alkaline chlorides melt easily, they may simply cover the particles of carbon with a coating of varnish, as it were, which prevents their burning by shielding them from the air. It is not the carbonate of potash itself, but the decomposition of the organic potash salts, that helps the burning. The carbonate of potash found in ashes is a mere product of the combustion. It did not exist, as such, in the tobacco leaf.

It is noteworthy that neither lime nor magnesia acts like potash in this particular, and that with the exception of soda, which is sometimes found in limited quantities in tobacco, potash alone is competent to do this kind of work. It has been proved by experiments that tobacco which burns badly, may be made to burn tolerably well by incorporating with it either malate, citrate, oxalate, or tartrate of potash in such quantity that soluble carbonate of potash may be formed in the ashes; and, on the other hand, it has been found that tobacco which burns well may be made incombustible by introducing the chlorides or sulphates of calcium, magnesium, or ammonium in such amounts that there shall no longer be an excess of potash in the ashes. In these experiments the tobacco leaves were dipped for a moment in solutions of the salts in question; the leaves were then shaken to remove the excess of liquor and left at rest in a closed vessel for 24 hours before they were hung in the air to dry. It should be said that these experiments were made for a scientific purpose merely. The intention was to test the truth of the idea above stated. It is said, however, that saltpeter, or a mixture of saltpeter and borax, or oxalic acid is sometimes added by the manufacturers of tobacco to correct its incombustibility; and that the combustion brought about in this way is not wholly satisfactory. It is said to be too thoroughgoing, to overpower or impair the proper flavor of the leaf.

Still other experiments have shown that it is easy to grow bad-burning tobacco on soils poor in potash, and good-burning tobacco on the same soil by manuring with sulphate of potash or nitrate of potash or even with carbonate of potash, though the carbonate, as well as wood ashes which contain it, is generally speaking not so good a fertilizer for tobacco as the sulphate and nitrate are. It was found, at the same time, that though chloride of potassium is less obnoxious than chloride of magnesium or chloride of calcium, from the fact that it supplies potash to the plant, it nevertheless does harm, as was said before, by supplying chlorine, and is consequently not a fit manure for the tobacco crop.

Entomological.

WHAT I KNOW ABOUT WEEVILS.

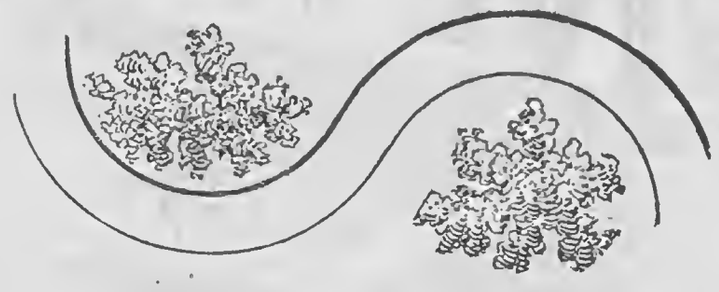
In this part of the country, the weevils first came to the farmers' notice in the years 1873 and '74, in this manner. After thrashing the wheat, when it had stood a little while in the granary, it was found to become heated and to have a queer odor. On looking close, we saw some small, white moths running and flying over it, and in many places wheat grains were held together by a fine web, forming balls, and inclosed in each of these balls was a small, white grub which seemed to get its living by eating the grains forming the balls, as these grains were more or less broken. Then, after cleaning wheat for sowing, we found, behind the fan-mill, many small insects about the size of common dog-flee. The color of some was black and of some brown or reddish, and they were very lively.

Now, I always thought these creatures were one and the same insect, only in different stages of its development; but in looking in Chamber's Encyclopedia, I find what is called the "Corn Moth (Tinea granella)" the description of which answers closely to this moth.

The Encyclopedia says: — "This moth is of a cream-white color; the superior wings marbled with gray, brown, or black, and when at rest sloping like the roof of a house, the fringe turned up behind like a tail. The larva, or Corn Moth—which for its voraciousness, is known as the wolf—eats into the grain, and attaches grains together by a web. Another very troublesome moth also called Corn Moth is Butalis cerealella, which is not yet known in Britain, but is found in some parts of Europe and America."

On looking further, I find the "Corn Weevil (Butalis granaria)" described as "a coleopterous insect of the family Curculionidæ, which, although a small creature, not quite two lines long, is often extremely destructive to grain stored in granaries." This would answer to those insects we found behind the fanning-mill; so that, if I am not mistaken, we have two instead of one insect spoiling our wheat, namely the Corn Moth and the Corn Weevil.

Now, let me give you some of my experience of the damage these pests can do. Last summer I thrashed nearly all my wheat from the field three weeks after harvest, the rest I intended to stack and thrash at the same time as my oats which were not yet cut when I thrashed the first time. Of this wheat, I put 150 bushels in the granary till October, and when I sold it, there were no weevils in it, and hardly a few moths; in fact, I can well say I found no damage done to it; while, when I thrashed



CURVE TOO SHARP.—FIG. 133.

the stacked wheat—which was in the middle of September—about one-fourth was mere bran and another fourth of the grains had weevil grubs in them.

Several of my neighbors who stacked their wheat complained that it had been much damaged in the stacks, and that they could not keep it, as it would heat in their granary. Thus it would seem that the sooner wheat is thrashed, the better. So far I have not found a better remedy and I don't think anybody has; if in this opinion I am mistaken, will the fortunate discoverer please let us know a better way to avoid the ravages of this pest.

Lake Co., Ill. CHARLES RILLIET.

THE WHITE PINE WEEVIL—(Pissodes strobi, Pack.)

WE learn from our correspondent in South Carolina that the White Pine weevil is becoming more and more destructive to coniferous plants in that part of the country. They no longer confine their depredations to the leading stem, but the lateral branches are attacked and the trees soon destroyed. On a single stem of the Deodar Cedar, six inches in length, he found ten beetles. This tree is highly prized for ornament in South Carolina and Georgia; but unless the weevil is in some way destroyed, its employment will have to be abandoned.

This beetle has occasioned much injury to Pines from Maine to Georgia, though it also affects the Hemlock and Norway Spruce. The beetle is oblong, oval, slender, and of a brownish rust color; on the thorax are two white dots and on the wing covers a whitish transverse band behind the middle; its average length is about three-tenths of an inch. The principal injury is done to the leading shoot or shoots of the tree. The beetle lays her eggs in the bark, dropping them at intervals throughout the entire length of the shoot. From each of these eggs hatches a white grub which eats its way inward and obliquely downward until it reaches the pith, in which it works a short distance farther, unless it should happen to meet another grub; in which case it feeds upon the walls of the mine already made until it attains its full growth. The eggs are laid early in the season and the shoot begins to wither during the summer. The grubs remain in their burrows throughout the entire season, changing to pupæ and coming forth as perfect insects early the ensuing spring.

The obvious remedy is to trim the trees well in late summer, and break off and burn the infested shoots with their contents.

Landscape Gardening.

THE FORMATION AND MANAGEMENT OF LAWNS.

JAMES HOGG.

THE numerous letters addressed to the editors of horticultural papers, seeking information on this subject, indicate that but few persons, unless they are professional gardeners, fully understand it. In reply to many such letters addressed to the RURAL NEW-YORKER, I submit the following rules and instructions:

Preparation of the Ground.

In the first place, the ground should be prepared by a crop of potatoes, corn or other hoed crop, in order to clean it as much as possible from weeds. After this crop is taken off, the ground should be plowed and the soil thrown into ridges so that the action of the weather in the winter, by its alternate freezings and thawings, may pulverize it and make it friable in the spring. While it is being plowed all boulders should be removed and all small stones carefully picked off, for it is impossible to have a smoothly mown lawn if stones crop out on the surface to interfere with the operations of the scythe or lawn mower. If the land has a retentive sub-soil or there are depressions in the surface which will hold water or are in any way wet or soggy, it should be well drained and the depressions filled up; for if not thus treated, nothing will grow in them but coarse, marsh grasses, or weeds incident to such habitats, and these will be a constant source of trouble and vexation. In the following spring, as soon as the soil is nicely dry and friable, the ground should be plowed with a sub-soil plow as well as with a surface plow. In this climate, with our tropical heat in summer, it is absolutely necessary to have the ground broken up to a considerable depth, in order that the roots may penetrate deeply into the cool, moist earth below the surface and so draw moisture from below, for without moisture it is impossible to give a bright, refreshing green to the lawn. If the sub-soil is of a gravelly texture and has a natural drainage, sub-soil plowing and artificial drainage may be omitted. Care must be taken not to bring the sub-soil to the surface, as it never produces as good grass as the surface soil.

After the land is plowed all hollows should be filled up by removing into them the soil from any hummocks that may exist. A road scoop and leveler are the best instruments for this purpose. If no hummocks exist, soil must be carted in to fill up the hollows, the object being to get the surface as even as possible. This being done, the whole should be well harrowed to reduce the soil to as fine a state as possible; then sown with grass seed, brush-harrowed in, and then rolled. If the land has been well manured for the previous crop, there is no necessity for manuring it for the grass seed; but if some fertilizer is thought to be necessary, use bone dust, superphosphate, or some other similar artificial manures, avoiding stable or barnyard manures, as they are always full of the seeds of weeds. A rank growth of lawn grass is by no means desirable; a healthy, robust, leafy growth is what is needed, and this is best attained by top-dressings as they may appear to be needed. Under no circumstances should stable manure, or any other likely to contain the seeds of weeds, ever be applied to a lawn. It will cost more than it is worth to extirpate the weeds. It is neither necessary nor in good taste to bring the lawn to a perfectly dead level; any undulations or swells of the ground should be preserved, provided they are not abrupt. If they are, they should be toned down by judicious leveling and made to run into the general level by easy, flowing gradients. If any rocks in places crop out upon the surface, they may be allowed to remain, as by covering them with trailing vines or masking them with shubbery they may be made an agreeable feature of the work. The lawn should never be brought up in close contact with the house or otherwise the latter will look, as Sir Thomas Dick Lauder expressed it "like a tea box on a green carpet." The house should always be separated from the lawn by a terrace, a balustrade or some similar architectural feature, or if this cannot be done or afforded on the ground of

FAULTY CURVE.—FIG. 134.

cost, wide flower borders should surround the house and these should be separated from the lawn by wide gravel walks.

As the purposes of a lawn are entirely different to those of a hay or pasture field,

The Selection of Grasses

must be entirely different, and only dwarf-growing, leafy species should be used for this purpose. All coarse-stemmed grasses or those growing in tufts should be avoided, hence such grasses as timothy grass, orchard grass and red clover should never be sown as they are worse than useless. Experience has shown that in this country, for general purposes none are better than, and few are equal to, the following species: Agrostis vulgaris (called red top in Pennsylvania, but which is not the red top of New York or New England, that being the well known timothy grass); Agrostis canina or Rhode Island bent, which by many is considered to be a dwarf variety of the first; Poa pratensis or Kentucky blue grass; Anthoxanthum odoratum or sweet-scented vernal grass; and Trifolium repens or white clover. Under the shade of trees the Poa nemoralis or wood meadow grass will be found to do better than any other species.

A good mixture of the above grasses may be made in the following proportions:

8	quarts of	Rhode Island bent
15	"	" red top
6	"	" Kentucky blue grass
2	"	" sweet vernal
1	"	" white clover
32	quarts, or one bushel.	

The quantity to be sown to an acre should not be less than three bushels, and four bushels will fully repay the extra cost.

The great object in sowing a lawn is to get a thick, heavy sward as soon as possible, and this can only be done by heavy seeding. Under no circumstances sow oats or any other grain with the grass seed. It is often done under the mistaken notion that the grass in its young state requires shade or protection of some kind, but this is a great fallacy, for the strong growing oats or grain will abstract far more moisture from the ground for its own growth, than its shade would have preserved for the grass. If the latter can have plenty of moisture the sun will have no deleterious effects upon it. In the latitude of New York, the seed may be sown during April or May and will produce a good turf by the ensuing autumn. Of course suitable allowance of time must be made for difference of latitude. The early autumn months, or as soon as cool nights with dews come in, is also a good season in which to seed down a lawn.

The After Management

consists in keeping it closely mown, going over it every ten or fifteen days with the mower according as the growth may be affected by the weather. It is well to leave the mown grass upon the lawn and let it dry up there. It shades the roots of the grass and prevents evaporation from the soil. As it soon disappears from sight it is not offensive, and when finally decayed gives considerable nutriment to the soil. Top-dressing with some readily soluble artificial manure should be given every autumn before the winter frosts set in, so that the autumnal rains may carry it down into the soil. Never top-dress with stable or barnyard manure, it looks very disagreeable and is only a vehicle for sowing weeds. Early in the spring go over the lawn with a small weeding spud and cut out all the weeds that show themselves. In spite of all that can be done, they will make their appearance, seeds of them from other quarters, being blown about in the air, find a ready lodgement in the grass and a very suitable situation for promoting their vegetation. If from any cause the turf should become thin in places, go over them in the spring with a soft brush harrow and put in some fresh seeds, finishing with the roller. It is a good practice, even if it is not necessary to put in fresh seed, to go over the lawn with a brush harrow and roller every spring, as it breaks down any worm casts and gives the lawn a smooth surface, and has also a tendency to keep down any moss that may come in. If it is thought necessary to destroy the worms, it can be done by dissolving six or eight pounds of stone lime in a hogshead of water, allowing it to stand for a day or two and watering the lawn with a watering pot, using the clear lime water. It is, however, a disputed point whether the worms do any real injury or not, many claiming that the perforations they make are an actual benefit to the grass by affording a ready means for aerating the soil about the roots. As to the moss, which in humid and pent-up situations is apt to be troublesome, the readiest way to destroy it, is by top-dressings of fertilizers, for plants of this class do not like manures. Never allow the grass to get more than four inches high before cutting it. Allowing it to grow like a hay field and then cutting it for the sake of the hay it will yield, as many people do, is a sure method of destroying it, as the process of seed-bearing destroys the vitality of the grass and the aftermath or growth is always more or less feeble, and the velvety appearance, so desirable, is effectually destroyed.

Roads and Trees.

The arrangement of roads and walks that may have to be laid out, crossing, or passing through lawns of large extent; and the grouping of trees and shrubs upon the lawn, are very difficult subjects to handle, either in theory or in practice, as they are purely matters of taste

and not of more arbitrary mechanical rules. They require, on the part of the person who proposes to design them or lay them out, an intuitive perception of the beautiful; a knowledge of the principles of the art; the faculty of seeing with the mind's eye the ultimate future effect of the grouping; and also an extensive knowledge of the different characteristics of trees and shrubs as shown in their growth, their spray, and the character and color of their foliage. In short, to be a landscape gardener in the true sense of the word, requires that one must have the feeling and appreciative discernment of a landscape painter, only instead of working with paints and brushes, one must work with the living materials; successful grouping and planting require this kind of knowledge. Some may feel discouraged from attempting the ornamentation of their country places, when it needs such requirements to succeed; but there is no real ground for discouragement, as every group of trees or bushes growing in a field, every pond margined by shrubbery, every sheep path across a field gives suggestions of what is true art and taste in such matters. Not that we should copy nature servilely; we should adapt her suggestions to our own needs and compositions. Sir Thomas Browne has quaintly and truly said, "All Art is but nature; for nature is but the art of God." Any educated, intelligent person is far more likely to succeed in the art of landscape gardening than would any stupid fellow whom he may employ for that purpose, whose only knowledge of art matters consists in serpentining walks without reason, and planting huddle-muddles of shrubs. Now as to

Walks,

it is a mathematical axiom that the shortest distance between any two given points is a straight line, and this is the proper line to make in laying out a walk or road, unless some reason, apparent or real, is given for a deviation from it. The laws of gravity, attraction and repulsion have, however, so modified this law in nature, that we never see any natural lines of motion that are absolutely straight, they all more or less partake of the nature of curved lines. The circle and combinations of its segments are only arbitrary mathematical figures inclosing the largest area within the shortest circumference. The former has no actual existence in nature among bodies in motion, it being modified by other laws so as to become a spheroid, an ellipsoid, a hyperboloid, or some similar figure. Hence the making of a serpentine walk or road by reversing two semicircles or arcs of a circle or connecting them by a tangential line, is in bad taste and is always unsatisfactory because it is unnatural. People instinctively see that it is incongruous, although they may not be able to give any reason for its being so.

Figures 133 and 134 will more readily explain this. Fig. 133 shows two arcs of a circle connected with each other. Fig. 134 represents them connected by a tangential line; and fig. 135 represents a flowing curved line. These make the difference very apparent. In laying out such a line, we have to be governed by the circumstances of the situation; graded, natural obstructions, such as groups of trees or shrubs, rocks or other objects, natural or otherwise, must always afford a reason for any deviation from a straight line. A curved line without any reason for it, is an incongruity. When passing any obstacle to a straight line, it should if possible, always be on the inside of the curve; and if any flower beds are laid out adjoining such curves the line of the bed next to the curve should always be of the same character as the curve, and parallel to it. In no case should a walk or road cross the lawn transversely to the point of the vision from the house, for it practically cuts the lawn in two and makes two lawns instead of one. All such roads should appear to be going from the house or returning to it, or leading to some point of interest, artificial or real, such as a summer-house, an arbor, a flower garden, a copse of woods or something similar. Roads and walks should never be lower than the verges of the lawn immediately in juxtaposition to them, otherwise they suggest gullies or ditches; they should always be fully up to the level of the lawn, or at the edges not more than two or three inches lower, so as to give a distinct line of demarcation.

Embankments.

If it is necessary to have any embankment on any portion of the lawn, it should always be made with flowing curves on the face and never have the appearance of a railway embankment. Whenever engineers are employed to lay out country seats, they invariably fall into this error, and they and nature have continuous fight, they endeavoring to keep the earth at the strict angle of its repose (30° to 37° according to the nature of the soil) and nature, through the elements, endeavoring to tone down the straight line to a curved one. Fig. 136 gives a comparison between these two lines. Walks should be kept at a reasonable

FLOWING CURVED WALK.—FIG. 135.

distance from the foot of each embankments in any case. In

Grouping Trees or Shrubs,

great care must be taken not to give them a clumpy appearance, either on the ground line or on the sky line. Groups of both should have the ground line very irregular, and groups of trees should be connected with each other by a few single specimens, which may be trees remarkable for their form or foliage. In groups they should be so planted as to admit plenty of air and light among them, so as to insure a full development of their characteristic growth, and to produce the beautiful effects of fleckered light on the grass beneath them. Nothing looks worse than dense, dark, untoned masses of shade on the lawn. It is as bad as solid blacks in an engraving, unnatural because too heavy. The sky outline is readily managed by the introduction of trees in pyramidal or spiry forms of growth, or any other forms which will destroy the billowy outline made by round-headed trees, or trees of the same species, such as is produced when trees of one species of Elms, Maples, Oaks or Pines are planted together; hence the necessity of variety of kinds in each group. Trees which bloom before their foliage is fully developed or trees with colored spray, should always have a background of dark-foliaged evergreens, it displays their floral beauty and colors with great effect, and, at the same time, lightens up or relieves for the time being the sombreness of the evergreens. For the same reason trees with light-colored foliage should always have a background of trees with darker colored foliage, as it brings them out in bolder relief.

Groups of shrubs should have a very irregular ground line, with deep indentations or bays, so as to produce strong shadows as a relief to the reflected lights from their foliage. As they are generally below the eye, this reflected light is too strong unless relieved by deep shadows. They should always be planted sufficiently far apart to allow each individual shrub to develop its own proper shape. Care should be had to plant each group with species or varieties which have some similarity of foliage. Kalmias and Rhododendrons will go together very well, or with Calycanthus; but they will not harmonize with Spiræas. It is different with shrubs in this respect, to what it is with trees—they are so close to the eye that the minutiæ of the forms of foliage are immediately apparent, and are not toned down by distance and atmospheric effect. The same remarks as to the sky line apply to them as to trees. I give two figures of each as explanatory of the ground and sky lines for groups of shrubs.

I trust that the above hints and directions will enable such of the readers of the RURAL NEW-YORKER as propose to improve their country places to do so with satisfaction. They will find it a subject of much interest and both a delightful and pleasing study.

The Horseman.

BREEDING HORSES FOR PROFIT.

L. S. HARDIN.

THERE is probably no animal on the farm that so deeply interests both the ambition and the hope of gain in the average farmer as the horse, and yet how few, how very few, ever make any money on the colts they raise; how few, in fact, ever use anything like a matured discretion in the course of breeding they pursue. There seems to be a dreadful fascination in one branch of horse breeding, that fairly engulfs the great mass of fancy, professional and farm breeders. That great American production, the phenomenon of the nineteenth century—the incomparable "trotter—" has set the bucolic mind agog, and no one thinks he can die happy without being in some way connected with the production of one or more of the modern flyers. I remember, many years ago, when this feeling, especially among the younger farmers at the South, was rampant about the running horse yelept the "thoroughbred," and from that day to this there is nothing that claims the semblance of an ancestry, from a bull pup to the crowned king, that does not master all his surroundings with the proud consciousness that he is "thoroughbred."

It was, however, soon found out at the South that while thoroughbred horses had sense enough to run around a smooth ring faster than any other breed of horses, yet as that was not the chief purpose for which horses were wanted, they were asked to work on the farm, and draw wagons and carriages as well as run races. This your high-toned and princely thoroughbred has always persistently refused to do. He is, therefore, very properly relegated to the past and race-courses, albeit many a poor stag that has no more pedigree than a Texas steer is sold every year in this city as a "Kentucky thoroughbred."

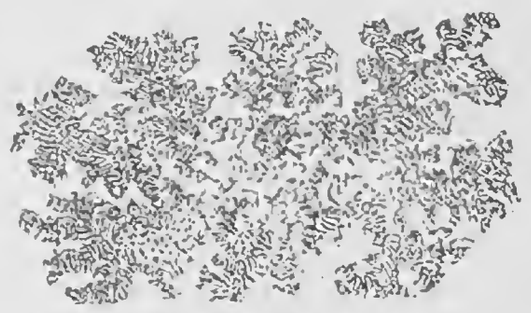
To this ignominous end will soon come the modern "flyer" with the average and busy farmer. He is not the horse we want either for general purposes on the farm, or draft or carriage purposes in the city, or for any one of the other thousand purposes to which this most useful animal, when properly bred, is capable of being adapted.

Let us take a business view of this question of breeding horses, and in order to do that intelligently, it is first proper to see what classes of horses are needed in the market, for in this, as in all other transactions, the supply should be regulated by the demand. Horses are in demand for: 1—running races; 2—trotting races; 3—buggy driving; 4—carriage and park purposes; 5—heavy draft; 6—farm or general purpose. These classes will probably include all the other special purposes that horses are used for. With our first-class running horse the fiat has long since gone forth that nobody can breed him at a profit but your professional race-horse man. The farmer has no more business with raising a thoroughbred horse, than he has with any other description of flying machine. With our second class, the trotter, it is a mere question of time how long the farmer will hold this precious delusion to his soul. Dan Swigert who carried this business as long as his horse genius would let him—and he probably has more of it than any man in America—told me that it cost him not a cent less than $100 a year for each and every colt he raised. He was more than lucky in having his sales average him over $500 each at the end of five years. To do this, some of the

GROUND OUTLINE AS GENERALLY SEEN.—FIG. 138.

colts had to realize fabulous prices. To be sure, he took extra care of his colts, but that brought him extra prices. If the farmer will count the cost of the stallion's service, with interest on the money, time the mare is idle; the cost of rearing the colt; and extra care that is necessary to realize an extra price, and then deduct the losses on little scrawny "weeds" that are good for nothing—if he will keep accounts, with these points strictly in view, he will soon give the trotting fraternity a wide berth.

The third class, buggy horses, is not what can be called a special class. They are generally made up from those that fail to come up to the standard of other classes—such as trotters, heavy draft and carriage horses or those that show more speed and style than are required on the farm. The gentlemen drivers of cities are becoming more numerous every year and creating a special but a limited market for this class of horses. The demand is too limited and the art of breeding too indefinite for any one to make a specialty of breeding this as a distinct class of horses, though there is beginning to be some demand in England and France for stylish buggy horses.



GROUND OUTLINE AS IT SHOULD BE.—FIG. 139.

Our fourth class includes carriage or park horses which are the most profitable to raise. This is best accomplished in conjunction with class number five—heavy draft horses. The stallion should be high-strung and spirited, with rather a light body in proportion to the length of his legs; but he must carry a high head, and should be able to strike a three-minute gait. A solid bay, with black points, is the best color. The brood mare to be put to this stallion should be of heavy body and stand on short, thick legs. From such a pair the offspring should make either a carriage or heavy draft horse, that would always command an extra price in the city market. When the colt favors the sire, he belongs to the class known as park horses. Those that are of good color, high-stepping and of free gait, are worth all the way from $300 to $1,000, if well matched. If the colt favors the dam, then it will be a good, heavy draft horse, and should weigh 1,200 pounds, and, if well matched, it should bring from $200 to $500, the price depending upon its style and action. The breeder should be able to match his own horses; for here is where all the profit comes in.

Our last class, the farm horse, is only too likely to be the refuse of the above classes. He should be put up with a special view to

drawing wood or plowing hard all day, and then taking the boys and girls to singing school at night, with a spirited and well contested race for three miles, on the road home at eleven o'clock at night, with the "swell" horse of farmer Jones's boy. The farm horse in this country that can't stand that, had better go out of the business.

Dairy Husbandry.

OLEOMARGARINE.

HENRY STEWART.

An old Fable Newly Applied.

ONCE upon a time there was an Arab, which his name was Am Eric Andai Ryman. He was reclining in his tent at midday and busily thinking over his past good fortune and the bright future which he anticipated. Suddenly the door of his tent was thrust aside and the uncouth head of an uninvited camel presented itself to his disturbed gaze. "Avaunt! profane beast," he exclaimed, "wherefore doest thou intrude upon my privacy and disturb my rest?" Then the camel replied, "My master, the heat of the noonday sun is intolerable, the inhospitable desert affords no shade, and the coolness of this tent invites me to shelter my head within it. *There is room enough for both of us*, but all I ask is to rest my head in the shade. Deny me not. The world owes everything a living and a shelter." "What art thou that askest this favor of me, thy master, oh beast."

"I am only a camel seeking a subsistence in this stupid world; my name is Oleom Arga Rine, and I am closely related to thy family."

"How so, profane beast," asked the Arab; "all flesh is grass, all fat is grease; therefore we must be related."

And the camel looked so pitcously that the kind heart of the good Am Eric Andai Ryman relented and he bid the camel put in his head and even offered him food from his table. But no sooner had the camel put in his head than he encroached still further and squeezed in his shoulders, and by and by his hump so crowded on the owner of the tent that the poor man was completely thrust out and had to content himself with the poor shelter afforded by the outside.

"Ungrateful beast," complained the Arab, "is this the way my generosity is returned?"

"The world was made for all,' replied the camel, "I have now the tent, and what a fool wert thou that thou didst not keep me out when I was out, and not permit me to get my head into thy tent. Know, oh Scheik, that it is easy to resist an enemy when he has no foothold in thy tent, but once he is in thou art at his mercy and must yield thy place to him."

"Alas, it is even so," exclaimed Am Eric Andai Ryman. "It is too late to cry over spilled milk. My own folly is to blame, and what has come upon me must be endured, for I see no way to regain my tent."

The facts in the case.

A few years ago an innocent-looking exhibit might have been seen at the American Institute Fair in New York. It was a plain glass case containing a few bottles of clear yellow oil, made from tallow and called oleomargarine. It was introduced from France, where it was used to adulterate or simulate butter. The writer, assured that this was a serious affair, threatening the dairy interest, immediately began to call the attention of dairymen to it, in the hope that steps would be taken to restrict the sale of the article and prevent injury. But the most surprising result occurred. Instead of fighting this thing "tooth and nail," it was invited into the dairymen's tent and at the dairy conventions, leading dairymen defended it and speakers glorified it. It was openly recognized as a fit substance to mix with skimmed milk for the manufacture of cheese, and I accompanied a deputation of influential dairymen to a factory near Rome, N. Y., splendidly fitted for this very manufacture, where samples of base cheese were examined and tasted and declared all right. Of that company I was the only one recognized as opposed to oleomargarine. *The camel's head was in the tent.* It was a very short time until the camel crowded the former occupier until he began to grumble, and now he is out and the other is in. Precisely what I prognosticated several years ago has happened, and the dairy interest has a powerful competitor to fight, which it actually helped to nourish and strengthen, when by one grasp it could have strangled it. These are the facts. Now what is

The truth about it.

When a manufacture has become established it cannot be put down. Capital and vested interests are concerned, and the solid footing gained helps to further advances. It is now, not as butter, but as a substitute for butter, that oleomargarine will come before the public, and there is no law, and can be no law, to prevent its sale *for what it is*. The trouble is that it really makes a very fair substitute for butter. I have seen dairymen smacking their mouths and looking wise over it, and unable to distinguish it from butter. I believe the only test short of a chemical analysis or a microscopical examination, which is perfect, is the manner in which it cuts into thin slices with a knife blade. Then it curls or bends and cracks because of its granular texture. When well made and fresh its flavor is agreeable; when pure, it is an unobjectionable article of food, for there is nothing about it that is not already used as food. The fat of an ox is perfectly healthful and nutritious, and the process of separating the limpid oil from the fat and of churning it into an emulsion with milk adds no more to it than is already contained in the major part of the butter, and that is a portion of milk. As a dairyman, I suffer from the competition, for although this substitute will affect mostly the lower grades of butter, yet the cheapening of these cheapens all above them, just as cutting off a few of the lowest steps from a ladder lowers the top ones with the rest. Now that the camel has our tent, I see nothing to be done but to let the world know that the present occupant has no connection with the former one, and compel him to go by his own name and label himself as he is, OLEOMARGARINE in conspicuous and unmistakable letters, at least one inch long, on the outside of the cover of the package.

Jersey Milk for Babies.

Col. Curtis is mistaken in saying I "assume" that there have been no cases in which children or calves fed with Jersey milk, have sickened. What I assume is that when this occurs with sound Jersey or any other milk, it is due to just what the Col. lays it to when he says "Probably if the milk had been diluted by making it one-third water, there would have been no trouble." Jersey milk, having less water, needs more dilution. I agree to that. But I protest against Dr. Sturtevant or or anybody else "assuming" that for this reason Jersey milk shall be refused to infants. All cows' milk, not excluding the immaculate Ayrshire's, will sicken infants fed with it unless water is also given, either *in* it, or *with* it. If Dr. Sturtevant had merely said that when Jersey milk is fed to babies, it should be more freely diluted with water than that of Ayrshires, nobody would have disputed it. What he did say was quite different, and, in my opinion, needed contradiction. Properly diluted, or as I prefer, with all the water in addition that the child wants, Jersey milk is perfectly suitable food for babies, certainly not less so than that of any other breed of cows. Having for years, during the practice of my profession in a large city, made the diseases of children a specialty, and the alimentation of such as were deprived of their natural food, a particular study, I welcomed Jersey milk as being naturally equal to the best for that purpose, and generally superior, because Jersey dairymen are, as a class, neat and careful persons, whose milk, when supplied to families, is more apt than that of others to be sweet, clean, and from carefully fed and tended cows.

Orleans Co., Vt. T. H. HOSKINS, M. D.

The Herdsman.

STOCK NOTES.

LARGE IMPORTATION OF HEREFORD CATTLE.—We note in our English papers that Mr. H. C. Burleigh, of Maine, has been selecting for himself and Mr. J. R. Bodwell, from no less than nine different herds, some of the best specimens to be found in England, of Hereford cattle. He commenced by purchasing from the celebrated herd of the Queen, and finished his ninth selection from that of the renowned Grove. The Hereford cattle heretofore imported into Maine, owing to their rapid growth, hardiness and excellent quality of beef, have become great favorites there. The extra thickness of their hides, clothed with abundant hair, and great vigor of constitution, enable them to withstand the severe cold winters of our most northern States equally well with the hardiest of the natives. Herefords also are making rapid progress on our vast Western plains, rivalling the Buffalo there in thrift and hardiness, and also nearly in size.

SALE OF ANGUS CATTLE.—The famous herd of Black Polled cattle, of the late Mr. M'Combie, half of which was bequeathed to his nephew, Mr. R. Campbell, is to be offered for sale soon at auction. Here will be an opportunity which rarely happens, to obtain the choicest of Polled stock. Mr. M'Combie's animals have almost universally taken first and second prizes for years past at Fat Cattle and Breeders' Shows throughout Great Britain and in France. The few Polled cattle imported into the United States during the past four years, have given much satisfaction, and their stock is just beginning to appear in market, and is eagerly sought for. We are persuaded that further importations would pay well, and we trust some of our enterprising breeders will soon visit England as well as Scotland to make purchases.

HEAVY FARM AND CART HORSES.—In breeding these, farmers should look very particularly to get plenty of bone, strong joints, cords, and tendons. Though muscle, that is, hard, firm flesh, instead of soft and spongy, must also be regarded. The bone of a thoroughbred horse (racer) is of a much heavier weight in proportion to his bulk, than that of the great, flabby, farm horse, which seems to be bred mostly like a bullock—for his flesh alone. But recollect horse meat is not a favorite in our markets, as it is in Paris, and some other cities of France. We want a horse alone for his work, and the one that can accomplish the most of this in the quickest time will sell quickest, and at the highest price.

UGLY BULLS.—In answer to the inquiry of Able Hoyt, what kind of slip-noose we use on ugly bulls, we reply, a slip-noose made with a rope strong enough and loose enough to choke the bull if he don't keep quiet. Our experience is, that after one or two tugs at such a slipping-noose an ugly bull will remain quiet where he is placed without endangering life by getting loose. Fastening by a ring in the nose is not safe, and a furious bull might break a rope around his horns. Hence we always rely on a slipping-noose in such cases, and "sleep well," feeling thas everything is safe. We shouldn't worry much if an ugly bull did get choked. F. D. CURTIS.

SULPHUR FOR ANIMALS.—If taken internally with their food, sulphur will almost invariably keep all kinds of animals free from lice. We have made a practice for years past of giving a heaping tablespoonful once a week in the feed of each of our cows, and the same quantity to about every ten hens in our flock, and they have never been troubled with lice in them. It may be given in the same proportion as to size when required in the food of poultry, pigs and sheep. Sulphur is a mild cathartic when desired for this purpose, and in small doses seems to have a general beneficial effect on the animal system, something like salt, though, of course, not of that nature.

The Poultry Yard.

DORKINGS ON TRIAL—THE BEST PLAN

COL. F. D. CURTIS.

IN many respects the experience of Mr. Jonathan Talcott with poultry, as given in the RURAL of February 14, coincides with my own. We have tried nearly all the fancy breeds and at last settled down to Dorkings, as combining probably the most good qualities of any breed. We first procured gray Dorkings sent over by Cooper, the great Irish fancier. After a few years we imagined they did not do as well as they ought to, although we had changed roosters, and so we procured a trio of White Dorkings, splendid specimens, and crossed them with the gray. We have as a result fowls of beautiful plumage—a great variety of colors—from the most delicately-tinted dove color to bright silver gray. Some are robin-breasted, and altogether they are as pretty a lot of fowls as we ever saw. They are large, square-bodied and plump, very quiet and hardy to raise. The hens are excellent mothers and the cocks not at all pugilistic. They are not given to scratch or to roam about, but at the same time are sufficiently active in searching for worms, bugs, etc. They have averaged during the winter about one egg a day for three hens. Some of our neighbors boast of having beaten this. We confess we are not quite satisfied with the winter's product. We hope, now that spring has come, that they will do better. Some farmers say that the hens which lay in the winter will not do so well in the spring. Perhaps our Dorkings are saving their energies for spring work.

The neighbor who sold the most eggs last year had Leghorn hens. These fowls possess an advantage over the Dorkings as they are non-sitters. Dorking hens, unless closely watched, will waste a great deal of time and flesh in sitting on nest eggs or in empty nests, which is not the case with Leghorns and other non-sitting breeds. It does not require so much food to keep these smaller birds in profitable condition, which is quite an item. This extra expense is offset in part, as Mr. Talcott says, "by having something to show when dressed." They are undoubtedly the par-excellence table fowl. Their eggs do not possess the rankness in color and taste of the Asiatic breeds. We have a few Plymouth Rocks, stately birds, which we are going to put on trial this spring alongside of the Dorkings, and a few Hamburghs (non-sitters) have also been added to the flock by way of comparison. Up to the opening of spring they excelled all the others in laying. The friends of the Hamburghs claim that they will keep ahead. We shall see. The truth is poultry keeping and breeding should be governed by the same general principles and rules which control stock breeding. Fowls should be bred for the purpose for which they are designed. If numbers of eggs, without particular reference to the size, are desired, then the Hamburghs, Leghorns, and games should be selected. If large, clear eggs are wanted, then the Spanish, Dorking and French breeds—the Houdans and Crevecœurs—should be had. If kept for table use, then the Plymouth Rocks and Dorkings should head the list as the most valuable.

If neither the quality of the meat nor of the eggs is to be considered, then the Asiatic breeds will supply the demand. For eating when young there is no nicer chickens than the Games. The Leghorns are also good, but the Hamburghs are not much better than a crow. We have an idea that following out the line of the above reasoning, we shall settle down to the common-sense as well as philosophical basis of keeping a few Dorkings and breeding them for table use, and Leghorns or Hamburghs for the production of eggs. These would breed together nicely, as the Dorkings' eggs could be readily separated and the Dorking hens used for the mothers. In this case Dorking roosters should be exclusively kept for the barn-yard, and a few of the laying breed should be confined by themselves in the early part of the season to get eggs to keep up the stock. Is not this the best plan to obtain the most perfect success? In this way we would get the full benefit of the special characteristics of the different breeds.

Field Crops.

SMALL AND DENT CORN IN THE WEST.

To the new-comer from New England and the East generally, no feature of our Western agriculture is more striking than the great size of the corn fields and the enormous growth, of stalks especially obtained therefrom. Of course, the grain is proportionately large, as every one knows, who has seen specimens of the Dent corn so generally grown in this section. Our long summers and very rich soils are certainly calculated to greatly increase the growth of the corn plant in all its parts. This I have proved by cultivating the small-growing Eastern sorts, which in New York and Michigan rarely grow higher than six or eight feet. After growing these in Kansas for four or five years without admixture, in favorable seasons they attain a hight of eight, ten or more feet. But it is worth while to remember in this connection that the great yields which we "read of," are not obtained in the Southern or Southwestern States, where the plant attains its maximum developement, but in a more Northern region where the growth of the plant is held in check by a comparatively low temperature. The prize-corn fields, so far as my reading has gone, have been generally located in Western New York, on Pennsylvania hill-sides, or Ohio creek bottoms.

A comparison of views with some of the best farmers of Central Michigan, has convinced me that where their soils approach ours in fertility, they can grow as large and perhaps larger crops than are grown in the great Western corn fields. I do not mean to say that corn can be grown as cheaply there as here; in this matter we have no rivals.

A review of the above facts, led me to conclude some years ago that the small Eastern sorts of corn might be advantageously grown in the West, and especially in those sections subject to late summer droughts. In 1876, I planted five acres of "King Phillip" corn, a kind having no special value over a half dozen others of the small Eastern sorts. This was planted in the poorest field on the farm, and as late as June 9th, while the Dent was planted one month earlier. The result was a great surprise to me, for under all these disadvantages, the "King Phillip" gave 44 bushels of shelled corn per acre, costing 16 cents per bushel, while the Dent yielded only 49 bushels costing 16½ cents.

In 1878, under equal conditions as to soil and time of planting, the "King Phillip" gave 50 bushels per acre, costing 13 cents per bushel, and the large Dent, 42 bushels, costing 12¾ cents. Again in 1879, the "King Phillip" came to the front with a yield of 53 bushels, costing 14 cents per bushel, while the Dent gave 41 7-10 bushels, costing 15 cents. I should have said that both sorts received precisely the same treatment during '78 and '79, except that the "King Phillip" was planted in drills 3½ feet apart, while the Dent was planted in hills three feet nine inches each way. The item "cost" in the above account refers simply to the expense of labor and seed.

But this is not all; this small sort ripens six to eight weeks earlier than the coarser Dent, and I am satisfied that had this small sort been in general cultivation in the State during the drought of 1874, more than half a crop would have been made, instead of the total failure then experienced. Moreover, the "King Phillip" is sweeter and more palatable to stock, which prefer it to all other sorts.

I should say, in conclusion, that our experience upon the college farm with the small-growing sorts, has not only satisfied me of their value, but it has convinced many of our best farmers of the same truth, and in this section a large area will, the present season, be planted to "King Phillip" corn. I have no hesitation in advising Western readers to give the small corn a trial the present season.

Agr'l Coll., Manhattan, Kan. E. M. SHELTON.

Miscellaneous.

WHAT OTHERS SAY.

EXTRACTS FROM AN ADDRESS BY J. G. BARGER. I am aware that there are very many who have no sympathy with the Grange movement; who have grave doubts of its ability to do any good; who go even farther, and condemn the whole business. They say it is a selfish institution, and positively injurious to the general welfare of society. For these people I have great charity. Now to these people I wish to present some solid facts, fully believing that more knowledge of our principles will make us more friends; and to Grangers let me say that the experience of the past years has taught us many lessons. The Grange work now lies out before us clear and defined.

WE FIND FROM the census of 1870, that there were in the United States 12,000,000 male persons engaged in all occupations. Of this number, 6,000,000 were engaged in agriculture. From the same source we learn that the total valuation of all personal and real property for that year was $30,000,000,000. Of this amount $11,000,000,000, belonged to the agricultural interest. You see that the agriculturists comprize one-half of the total number of persons engaged in all the various industries of the country, and that their business has for its capital stock over one-third of the entire wealth of the country. After realizing as best we can how immense is the amount of human and monetary energy used in this business, we naturally might expect some great results. From the report of the Department of Agriculture we learn that in 1879 the value of our principal crops, corn, wheat, oats, barley, rye, buckwheat, potatoes, hay, cotton and tobacco, was $1,904,000,000. Let us compare this amount with the value of precious metals that have been taken from American mines. From the best authority we learn that the total value of the yield of the American mines during twenty-seven years, from 1849 to 1875, was $1,617,000,000. You notice that the value of ten of the principal products of the soil for the one year of 1879 was greater than the total value of all the gold, and silver obtained from the mines during twenty-seven years of prosperous and feverishly active operations. Let us go farther. If we ascertain the value of the various productions of the soil besides the ten staple commodities mentioned, and to that amount add the enormous wealth which is yearly derived from animals and the productions of animals, whose sustenance the soil furnishes, we are safe to say that the gross results of the farmers' business for one year is greater than that of all the mining operations of this country, since gold was discovered in California in 1849, up to the present time.

From the evidence offered we might draw the conclusion that the farming business is a satisfactory success. Viewed in its general aspect such is the case; but when applied to the individual farmer we see the situation in an adverse light. For the past ten years American farming has been cheerless and unprofitable. The handling of the currency question and the shrinkage of values has so disastrously affected the debtor class, of which the farmers constitute a large share, that thousands after struggling bravely for a time were obliged to yield to the inevitable. They saw the magnitude of their indebtedness doubling upon them, and were powerless to avert their certain fate. The figures that represented their debts remained the same, but it took more than twice the amount of the same products which the farmer had to pay with to make the same payment on these debts that it did when the debts were contracted.

This revolutionizing of values has made the poor distressingly poor and the rich oppressively rich. There were men, who by their industry and economy, during years of hard work, had saved up quite a competence. They bought farms at the high prices of land and farm products; they paid in what they had and gave mortgages for what they owed. The change came. The land and produce decreased in value, but the mortgages did not. By and by the mortgages covered the whole value of the farms and better security was demanded.

We see how gracious the government is to manufacturers. What does it do for the agriculturist? Of all the enlightened nations on God's foot-stool the United States does the least for its farmers. Even the little government of Sweden in 1877 expended more than four times as much as the United States did in that same year to promote its agricultural interests. With the proofs so clearly given of how much the farmers have done and are doing to promote and protect our country's best interests, the government treasury allows to them out of the many millions it annually expends and squanders, $200,000 for their benefit. This fact is a disgrace to our national record, and an insult to American farmers; but so long as farmers insist on selecting lawyers, merchants and professional men to legislate for them, how can they expect anything different?

Let us consider the railroads of this country. Ostensibly creatures of the law and public servants, they have become indifferent to all moral and legal restraints. They control legislation and make all classes victims of their caprice and avarice. While the railroad interest has for its capital, counting watered stock and all, only one-fourth as much as the farming interest has, and one-sixth as many persons employed in its business as there are farmers, yet it presumes to and does fix the price of every dollar's worth of produce the farmer has; and this assumed task it performs without any consideration of right or justice. In one year the freight rates between New York and Chicago varied from two dollars to thirty-seven dollars per ton.

The Grangers have done good work in this direction. Let them study the question thoroughly; think it over. Let their opinions be known and it will not be long before the extent of the injustice and extortion which our present laws allow railroad corporations to practice, will be understood, and such a moral force and urgent demand will reach our legislators that they will think it for their interests as politicians to heed the warning and do something to correct the flagrant wrongs.

What farmers want to do now is to realize the necessity of doing more work with their heads and less with their hands. It is absurd to think that in this age muscle can compete with brains. The person conversing pleasantly through the telephone with a friend 200 miles distant represents brains. The stage coach carrying the same messages, plodding along six or seven miles an hour represents muscle. To-day mind rules the world. The farmer needs a more complete knowledge of the various causes, natural and artificial, social and political which affect the farming interest. Then he will see how legislation and pampered monopolies combine together to deprive him of rights and privileges which justice declares belong to him. He will better appreciate the importance, usefulness and honor of his occupation. Then the sense of duty which he owes to himself, to his family and to succeeding generations which will follow in his pursuits, will urge him to take such action, to make such earnest and persistent efforts as will result in elevating the agriculturists of this country to that high standard socially, financially and intellectually, which they have merited and are entitled to hold. Brothers of the plow the power is with you.

INSECTS AND PLANTS. Most of the higher flowering plants would speedily perish were insect aid withdrawn, and but for such aid in the past we would now see, instead of our gorgeous flora of Orchids, Lilies, Magnolias, and Roses, one consisting chiefly of Ferns, Cycads, and Conifers, mingled with Willows, Oaks, and Alders, and plain grasses and rushes.—American Entomologist.

DR. SCHUBELER, of Norway, and his associates after years of observation, arrive at the following general conclusions respecting seeds grown in different climates or conditions:

"I. The grain of wheat that has been grown in low-lying lands may be propagated with success on the high fields, and will reach maturity earlier at such elevations, even although at a lower mean temperature. Such grain, after having been raised for several years at the highest elevation which admits of its cultivation, is found when transferred to its original locality to ripen earlier than the other crops which had not been moved. The same result is noticeable in grain that has been transported from a southern to a more northern locality, and *vice versa*.

2. Seeds imported from a southern locality, when sown within the limits compatable with their cultivation, increase in size and weight, and these same seeds, when removed from a more northern locality to their original southern home, gradually diminish to their former dimensions. A similar change is observable in the leaves and blossoms of various kinds of trees and other plants. Further, it is found that plants raised from seed ripened in a northern locality are hardier, as well as larger, than those grown in the south, and are better able to resist excessive cold.

"The further north we go—within certain fixed limits—the more energetic is the development of the pigment in flowers, leaves, and seeds. Similarly the aroma, or flavor, of various plants or fruits, is augmented in intensity the further north they are carried within the limits of their capacity for cultivation; conversely, the quantity of saccharine matter diminishes in proportion as the plant is carried further northward."

PELARGONIUM MRS. CANNELL.—This, as described in the last number of the Florist and Pomologist, is a striking advance in the true Ivy-leaved section, being "the largest and by far the best shaped flower yet obtained. It is a plant of vigorous growth, and therefore well adapted for growing on into a specimen. The flowers are large in size, perfect in form, stout and durable in substance, and produced in bold, well-filled trusses, while the color is a deep mauve-like lilac or purple, beside which all the other similarly colored sorts look pale and ineffective." To Mr. Church, a hybridist of some years' standing, is the credit due for raising the variety, which Mr. Cannell will in due time send out.

IT IS one of the chief advantages of the thoroughbred animal of any species, says the Nat. Live Stock Journal, that he possesses the power of transmitting his own qualities when crossed upon animals of a mixed origin, so that for the actual uses of the farmer a few crosses of any pure blood will give all the desirable points of the thoroughbred. A good and well-bred Short-horn bull coupled with our common cows, will, nine times out of ten, get calves that, for the purpose of beef production, are absolutely worth twice as much as calves from the same cows got by a common or scrub bull; and a second cross—that is, a thoroughbred bull coupled with these half-blood cows—will produce calves that are worth still more than the half-bloods for feeding purposes. And so of any other breed of any kind of farm animals. If the peculiar qualifications of the Jersey breed is desired, there is no need that the farmer should sell off his present stock and buy a herd of pure Jersey cattle. He can do better by purchasing a good Jersey bull; and by using him he can soon engraft the qualities of the Jersey upon all his young stock.

ONE of the very best flocks of fine-wool sheep of which the writer above referred to has any knowledge has been built up by this process. Commencing, twenty-five years ago, with a clearly defined idea of what he wanted, the owner of this flock selected a small lot of the best common ewes he could buy in his neighborhood at a reasonable cost. He then paid a good price for a pure Merino ram and commenced the process of *grading up*. In a couple of years the original flock of ewes was discarded entirely, and the young half-blood ewes took their place. Another pure Merino ram was procured and coupled with half-blood ewes; and he has kept on in this way every year or two buying a new purely-bred male, and retaining the choicest ewes of his flock, fattening and selling off the inferior ones, until he has, as we have said, the very best flock of which this writer has any knowledge. And this is the secret of the whole business; using only thoroughbred males, and selecting from year to year the best females of his own breeding for the purpose of reproduction.

PYRETHRUM. Some observations reported to me (Prof. Hilgard) seem to render it probable that the cultivation of the Pyrethrum between the rows of other plants will, in a great measure, protect these from the attacks of insects; as, of course, the plants themselves are let severely alone by them. It might even seem worth while to try this plan against the Phylloxera, in so far as the winged insect could scarcely escape the deadly effects of the Pyrethrum, thus preventing its spread. It has been reported that a certain kind of Sumac has thus served to save many of the vineyards of the Isle of Cyprus.

CORN. Dr. Sturtevant says in the New York Tribune that Waushaknm Corn, in three years' breeding, has increased in weight from 56 pound to 64 pounds per bushel for the selected ears; from on open ear to a close, compact cylindrical ear; from a crop that varied greatly in size, shape and quality of ear, to at present a crop of excellent uniformity, and extremely few unmerchantable ears. Per contra, a single ear selected for poor quality, yielded 181 ears, of which but two were of fair quality, the remainder, or 99 per cent. being soft, short, gnarled, etc. Where no culture gave two bushels of ears as good as seed, culture gave 16 bushels as good as seed, and the best culture gave 26 bushels of ears as good as the seed.

CHANGING POTATO SEED.—So far as I am aware, says Professor Goodale, in Land and Home, no careful, systematic experiments have yet been made in this country for determining the advantage of "changing seed," as it is termed, or of planting only such as were grown on a heavy loam, and in a cool climate—say either in Northern New England, or in localities 1,000 feet to 2,000 feet above sea level. My own observations and experiments lead me to believe that this advantage is very great, and I am satisfied that the New Jersey farmer, for example, will add at least one-third to his product by planting Maine-grown seed.

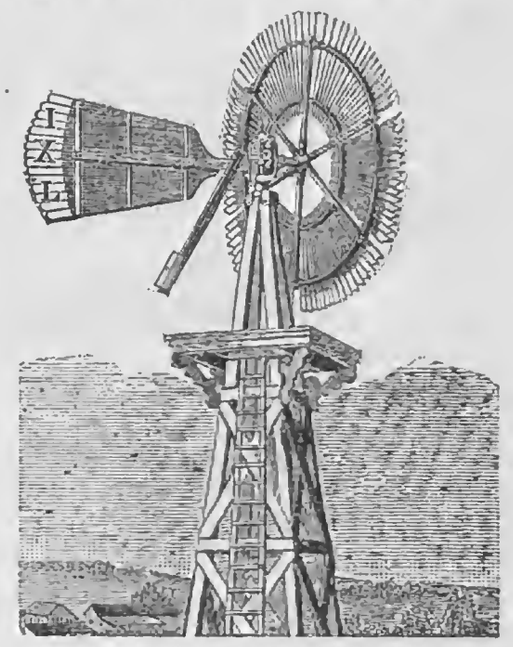
"A NOTEWORTHY sight," Dr. Sturtevant remarks in the same journal, speaking of a visit to the Department of Agriculture, "is that of a bottle of white corn, representing 69 bushels of shelled corn per acre, and alongside a bottle of sugar from its stalks, representing an additional harvest of over 900 pounds per acre. In this case, the stalks were worth more to the producer than the corn. This discovery that the stalks, at the period of full maturity, contain the largest quantity of crystallizable sugar, is of great importance, when we consider the range of the culture of the maize plant, its adaptation to our agriculture. and the value of its grain."

TAINTED MILK.—At Welshpool a case of diphtheria was traced back by medical experts to milk delivered from a house in which this disease prevailed; and at Fallowfield, near Manchester, thirty-five persons, belonging to eighteen families supplied by the same dairy, were attacked with scarlet fever, twenty-four of them within thirty-six hours, and the local Government Board, after careful investigation, believe it was spread by milk drawn from the cows by a man who had lodged the previous night in a house where there was a case of scarlet fever.

Industrial Implements.

THE "I X L" WIND-MILL.

THIS excellent wind-mill is made by the Phelps and Bigelow Wind-mill Company, of Kalamazoo, Mich. In it there are only two points of friction—the main shaft on which is fastened the wheel that operates the machinery, and the crank which moves the pitman up and down to do the pumping. The wheel is solid, of the sort known as the rosette, unusually strong, and firmly braced in front. To stop the mill, the wheel is thrown around by the side of the rudder, exposing only its edge to the wind and stopping instantly, instead of, as in the case of other stiff wheels,



throwing the rudder around by the side of the wheel, leaving the latter still facing the wind until this is strong enough to shift the whole mill with the edge to the wind. One of the most notable features of this mill is its self-governing faculty: when the wind blows harder than the wheel ought to bear, there arises a tendency to fold the wheel and rudder together; and when, in a high wind, the wheel would turn too fast if it faced the wind directly, it turns itself more or less aslant to the wind and keeps just the amount of speed it is designed to have in ordinary winds. If the storm rages too violently, the wheel and rudder fold gently together, and so remain until the gale has abated. Testimonials from well known farmers who use the mill, speak emphatically on this point; some found it to work admirably in sleet and ice storms; others praise it for being tempest-proof, having been unharmed by storms by which trees were prostrated, while all extol its simplicity, self-control and great efficiency. The best material alone is used in the construction of this mill, no part of which is slighted. Indeed the Company warrant it for every point they claim for it, and we urge all in need of a strictly first-class wind-mill to send for full particulars to the above address.

GOOD PREMIUMS FOR A USEFUL OBJECT.—J. A. Field, Son & Co., of St. Louis, Mo., manufacturers of the Big Giant Feed Mill, offer four of their mills as premiums to encourage experiments in testing the value of corn-cob ground together with corn meal for stock feed. They offer One Big Giant, No. 3 Improved, $65.00; for best results in cattle feeding; one Big Giant, No. 2, Improved, $50, for second best results in cattle feeding; one Big Giant, No. 2, Improved with sieve attachment, $60, for best results in hog feeding; one Big Giant, No. 2, Improved $50.00, for second best results in hog feeding. Reports of competitors must be furnished on or before Sept. 1, 1880—stock to be fed for not less than 60 days. We advise all our readers interested in the solution of this problem—and what farmer is not?—to send for full particulars of the conditions of all the experiments.

Everywhere.

RURAL SPECIAL REPORTS.

ARK., Greenwood, Sebastian Co., April 10.—The last three weeks have been dry weather. Forest fires are becoming quite troublesome. Roads dry and dusty. Apple trees in bloom. Blackberries blooming. Forest trees nearly in full leaf. Lettuce and spinach ready for the table. Immigrants coming in from all quarters. Real estate increasing in price. Wages both reasonable and plentiful. Farmers very busy preparing ground for cotton, of which a larger acreage than usual will be planted. Quite a number are going to try raising peanuts which are said to be a profitable crop. All kinds of fowls are raised here with profit. R. R.

ILLS., Baldwin, Randolph Co., April 12.—There will not be as large an acreage of oats sown as usual; the high price of seed oats and the wet weather are the drawbacks. Wheat is looking better than it did at my last report, and where it is good, it looks very fine; but in some places it is very poor, and, taking all into account, the prospect now is not nearly as good as it was at this time last year. Fruit has been injured in some places by the late frost, especially Peaches; but from what I can learn through this section there promises to be a fair crop. Oats are high, 40c. per bushel; corn is also selling at 40c.; wheat has declined to $1.05, and Irish potatoes are all the way from 25c. to $1, the price depending on quality; the last figure being for New York Early Rose for seed. Sweet potatoes are selling at $1.25 per bushel. Farmers, as a rule, are well up with their work, with the exception of sowing oats. There are many farmers in this section who raise nothing but wheat—every acre they can possibly get ready in the fall is sown to that. They do not even raise corn enough to feed their own stock, and some after putting all their own land in wheat, pay a high rental for other land to raise a small crop of corn, or what is strictly necessary to feed their stock. Their stock consists generally of only enough horses to work their farms, one or two cows for milk and butter for family use, and hogs sufficient to fatten and kill in the fall for meat for home use the next year. In this way they risk everything on one crop. If it fails, they have made nothing; and sometimes they have really lost money. Of course, once in a while these farmers make it pay, as they did last year; but I think all will agree that last year was an exceptional one both as to the yield and the prices obtained. Taking it one year with another, however, I question very much whether wheat alone pays nearly as well as mixed farming. It hardly ever happens that we have a general failure as to crops and prices, and by having several different crops to depend on, there are more and surer chances of profit. If wheat fails, you can have corn, oats, hay or stock to fall back on to make up the loss; and if corn is short, wheat may pay. So I believe it pays better even here where there is no range, to keep a few extra head of cattle or hogs to use the surplus hay and corn on the farm rather than to sell these to some one else to feed. Such stock are always sure of bringing money at any time, and when wheat fails, it is quite a consolation to feel that you have something else to fall back on. Then, again, a man who practices mixed farming has less money to pay out for hired help; for he is able to do more of his own work himself, and thus save considerable in the expense account. Wheat is always considerable expense, as it is a crop that has to be attended to at once, and at a time the laborer exacts the highest price for his work; consequently a failure in that involves considerably more loss than in almost any other crop, and to me it seems more than ever desirable for every farmer to raise something else to make up the possible loss by reason either of low prices or of the failure of the crop. N. J. S.

ILL., Stone Station, Lee Co., April 14.—There was considerable wheat sown last fall, but on account of the open winter it is about all winter-killed, especially the Odessa variety, which is a spring wheat properly and not a good kind to sow in the fall; Last year, however, we had a very good crop of winter wheat of that kind. Rye looks well considering the open winter. Our prices are lower in some of the staple products than they were last fall. Corn, 30cts. now, and last fall 35cts.; oats, 28 cts.; wheat $1@1.15; rye 75cts.; hogs about $4. C. S.

ILL., Elkhart, Logan Co., April 12.—Wheat in our section is generally good. Winter seems to have been the worst on that which was broadcasted; but even this appears to be coming out all right. The fly has not harmed it to my knowledge. Its general appearance promises an ordinary crop. G. P. O.

IND., Argola, Steuben Co., April 13.—The condition of wheat here is excellent. The past winter did not injure it at all, and since then the weather has been fine. We are increasing the area under wheat every year, a much larger acreage than ever before was sown. Southern Michigan and northern Indiana will reap a far larger wheat harvest this year than they have ever done. The prospect for fruit of all kinds, too, is good. Spring work is "driving." T. B. L.

IOWA, Dakota, Humboldt Co., April 13.—We raise no winter wheat in this vicinity; all ours is of the spring varieties. Last year the yield was good—generally from 15 to 20 bushels to the acre of No. 2 wheat. On new land the yield was even better, in some places running as high as 25 bushels. The chief injury was done by rust; the weevil also did some damage, and while in the milk some of it was injured by showers and the hot sun. This spring a larger acreage is being put in. Wheat sells here now at 80 to 90c. The corn crop last year was large and the acreage much greater than usual. The yield was from 50 to 60 bushels to the acre and the price from 17 to 25c. About one-third more will be planted this year than last. G. L. H.

MO., Reigsburg, Wells Co., April 15.—Some pieces of wheat are badly killed by freezing and thawing. Some on low ground was killed by drought last fall; but generally it looks as favorable for a good crop as I have ever seen it. It is not damaged by the fly to any extent. The acreage is larger than usual. It shows no signs of disease as far as I have been able to learn or observe. J. H. G.

OREGON, Springfield, Lane Co., April 6.—We have had one of the worst winters known in this State; rain and snow since the first of Dec. Winter wheat is looking well and there is a fair prospect of a large yield. Hessian fly has never been known in this state. Acreage larger than last year. Spring wheat is mostly raised in this county and does well. Farmers are rather late in sowing this spring on account of bad weather. Wheat per bushel, $1; oats, 45@50cts.; potatoes, 50cts. D. J.

OREGON, Long Tom, Lane Co., April 7th.—We had a hard winter in Oregon, yet early-sown wheat looks well. A great deal is sown that is not up yet, and much more will yet be sown; probably seeding will not be done before the first of May. There is no appearance of disease in the grain already growing, although frosty nights are no benefit to it. The Hessian fly is unknown here. The general appearance of wheat is about the same as last year and the acreage much larger. E. B. B.

OREGON, Canby, Clackamas Co., April 8.—Wheat in this section does not show any signs of disease. The Hessian fly is not known here. Its appearance is as good as in former years only it is smaller. The acreage of winter wheat is smaller; but it is thought that the acreage of spring wheat will be larger than last year. We have had an unusual amount of snow this winter and a very late spring. It is very cold and chilly at this time. J. S.

OREGON, Cornelius, Washington Co., April 5.—The wheat has not made as vigorous a growth as in former winters; but it is looking very healthy. It is not injured by the frost. We have no Hessian fly in this country. The prospect for the fall-sown grain is very good—equal to that in our most prosperous years. The acreage is a about the same as last year. There will be a greater amount of spring wheat sown than ever before. J. R.

OREGON, Tangent, Linn Co., April 6.—The wheat in our section looks worse than usual at this time. The winter has been unusually severe on the crop. There is no appearance of any injury from the Hessian fly. There was as much as 50 per cent. more acres put in last fall than ever before, but I thing it looks 20 per cent. worse. R. L. S.

OREGON, Portland, Multonomah Co. April 7.—Wheat in this section is not injured by the winter. No signs of any disease. The Hessian fly is unknown here. Its general appearance is good as compared with other years. Acreage is larger. H. O. B.

OREGON, Scottsburg, Douglas Co., April 5.—About twenty-five per cent. more wheat was sowed this year than usual. No Hessian fly; no signs of disease. Plenty of oats and barley—always good crops. T. W. A.

PENN., Cool Spring, Mercer Co., April 16.—Wheat looks well and more than the usual acreage was sown last fall. Prices are:—wheat, $1 30; oats, 35 cts.; corn, 30 cts.; clover $5. Last year wheat and corn, half crops; oats good. S. R. B.

TENN., Beckwith, Wilson Co., April 14.—Winter wheat is in fine condition; prospects good for a large crop; I have some that is knee-high and preparing to head. The farmers in this county have nearly finished planting their corn. We have had too much rain since the 1st. of February. Seasonable at present. R. Y.

WASH. TER., Alpowa, Columbia Co., April 7.—The past winter has been a severe one for fall-sown wheat. There is no disease in wheat here except smut, and this is prevented by treating the seed with sulphate of copper. The Hessian fly does not trouble the wheat here, and its general appearance is not quite as good as on other years, but the acreage will be much larger. N. A. W.

WIS., Labelle, Sauk Co., April 15.—Half our winter wheat appears to have been killed; the rest will most likely give an average yield per acre. No Hessian fly in this section. Fully half as much acreage as last year has been sown to wheat. W. S. H.

The Querist.

ANSWERS TO CORRESPONDENTS.

The New York Law on Line Fences.

J. H. L., Coxsakie, N. Y., has a wood lot lying separate from the farm and assessed by itself. It has been owned by the family for 40 years and has never had any fence in front of it—that is, along the road. On the three other sides, the adjoining land is owned by three separate men, one of whom has served a notice on our inquirer that he must build his part of the line fence between the wood and the neighbor's lot. The fence is of no use to our correspondent, as the wood lies in common and will do so as long as it is owned as at present, and he asks whether he can be compelled to build the fence.

ANSWER BY F. K. MORELAND.

The general rule in this State is, that when a land owner elects to let his land remain uninclosed, it is no one's business but his own. By allowing his land to remain open and unfenced he tacitly permits it to become common. In no case can a land owner be compelled to maintain road fences; this has been the case since the legislature passed an act to that effect several years since. Our courts have decided over and over again that if a land owner doesn't wish to build partition fences but chooses to let his land remain in common, he cannot be disturbed in this assertion of his sovereign rights. The Supreme Court says in Chrysler vs. Westfall, reported in 41 Barb. 159. "If an owner chooses to let a portion of his land lie open, he cannot be charged with the proportion of the expense of a partition fence, under the Statute" (1. R. S. 353 § 30). Section 30, above referred to, has been several times amended and in 1871 Chap. 635 was made to read as follows:

"When two or more persons shall have lands adjoining, each of them shall make and maintain a just and equal proportion of the division fence between them in all cases where each of such adjoining lands shall be cleared or improved, and where such adjoining lands border upon any of the navigable lakes, streams or rivers within this State, it shall be, and it is hereby made the duty of the owners thereof, to maintain such division fence down to the line of low water mark in such lakes, streams and rivers." Section 31 of the 1 R. S. now reads as follows, Chapter 635 Laws of 1871: "Where two or more persons shall have lands adjoining, and not within the provisions of section 30, as hereby amended, each of them shall make and maintain a just and equal proportion of the division fence between them, except the owner of either of the adjoining lands shall choose to let such lands lie open. If he shall afterwards inclose it, he shall refund to the owner of the adjoining land a just proportion of the value, at that time, of any division fence that shall have been made and maintained by such adjoining owner, or he shall build his proportion of such division fence." Such is the law in regard to division fences. And the portions of the statute law of this State in reference to lands lying uninclosed, seem to me to be founded upon the theory that the only person who suffers from the want of fences is the owner or owners of such uninclosed lands; that if such owner permits the world at large to come upon his uninclosed land at will, he, and not his neighbor, is the only person that is damnified. And if any adjoining owner, in a case where there is no division fence, wishes to have his lands inclosed, he must do it himself and not call upon a land owner who doesn't wish to fence his own lands, to contribute to the cost of inclosing his neighbor's lands—a proceeding in which there is not a particle of justice.

Action of the Nitric Ferment in the Soil.

W. M. C., Glenwood, Utah, referring to our editorial on Nitrification in the Soil in the issue of March 13, asks how does the nitric ferment produce the niter in the manure—does it decompose the woody fiber and extract and feed on the albumen; or does it feed on the fiber and inhale nitrogen from the atmosphere and compound it with the carbon, and develop nitro-carbon, or excrete some form of nitrate, as of potash, soda, etc?

ANS.—Very little is known as yet with regard to the precise mode of action of the nitric ferment. Indeed, looking at the matter from the agricultural point of view, it would seem best to content ourselves for the present with the discovery that nitrates are really formed through the intervention of a ferment, and to devote our energies to the application of existing knowledge to the treatment of the soil and the compost heap so that the largest possible yield of nitrates may be got at the least cost. It is highly desirable, of course, that the natural history of this microscopic organism should be well made out. But for the moment we may well pause to consider more particularly the good which is done in the world by the ferment and how best to avail ourselves of it. In seeking to form a conception of the action of the nitric ferment we naturally turn to the somewhat analagous case of yeast. When the yeast plant is mixed with flour and water, at a suitable temperature, it thrives; and as one result of its life various chemical reactions occur in the substance of the flour, among which the production of carbonic acid specially interests the bread-maker. Just so the nitric ferment thrives in the soil and compost heap when they contain fit food and when the conditions as to air, warmth, moisture, darkness, etc., are favorable. In this case, also, chemical reactions occur, incidentally as it were, as a result of the growth and multiplication of the ferment, and among them the formation of nitrates from the nitrogenous and saline matters in the earth, is of prime importance to the farmer. The nitrates are active and approved forms of plant food, immediately available for the growth of crops, while the nitrogenous matters from which these nitrates were derived may have been inert and crude and of comparatively little worth. When nitrification occurs, there is probably no gain to the farmer as to the total amount of nitrogen, but there is a very great improvement as to the quality of a part of it. In all probability, some of the nitrogen of the crude materials goes to waste during the fermentation, but the nitrogen in nitrates is of so much better quality than the nitrogen of the crude substances, that it is a great privilege for the farmer to be able to make nitrates from a part of his store of nitrogenous materials. There is every reason to believe that the ferment feeds on dead organic matters in the earth, "woody fibre, extracts, albuminoids," and what not, but the analogy of the yeast and other organized ferments points to the conclusion that the nitrates formed are not in any sense to be regarded as secretions. For the present, it may be said that we know that the nitric ferment can change the ammonium compounds, which result from the decay of humus etc., to nitrates; and that it is not unlikely that the inert nitrogen of humus can in like manner be changed by the ferment. But there is as yet no evidence that the ferment can convert the free nitrogen of the air to nitrates.

Coloring Butter.

W. H. S., no address, asks, 1, how to color butter, so as not to look brown, as his always does, when colored with annatto, first mixed with melted butter, next strained and allowed to cool, and then mixed with the newly made butter; 2, how to prepare a home-made incubator.

ANS.—1, There are several methods employed by old and experienced dairymen for preparing annatto for coloring butter, only a few of which space will permit us to give here. Melt about, say, a pound of butter, so that the heavy part may sink to the bottom, and pour the light clear fat on the top into another dish. Into the fat poured off, put a piece of annatto, about the size of walnut, wrapped up in a linen cloth, and place the vessel again over the fire. The coloring matter strains through the cloth, and turns the butter brown-red, when it should be allowed to cool off. When the butter is to be colored, some of this is melted, salted and mixed very carefully into the butter after washing. The quantity to be mixed will depend on the shade of color the maker wishes to impart to his butter, and a little practice soon enables him to take the right quantity. Great care should, of course, be taken to work the butter thoroughly, as, if streaked or marbled, it will, most probably, fetch a lower price in the market than it would if uncolored. The better way is to use the annatto in the cream, and then during the process of churning, it becomes perfectly incorporated with the mass and gives an even shade throughout the butter without any trouble. A simple recipe for cutting the annatto for this purpose is as follows: Dissolve a half pound of concentrated potash in five quarts of water, by heating and stirring. Pour off the lye from the sediment, add one pound of the best annatto and dissolve it. Boil gently for twenty-five minutes, by placing the mixture in a kettle surrounded by water, so as to prevent scorching or burning. Then let the mixture settle; rack it off, and strain through a fine cloth, and bottle for use. By measuring the quantity of cream and the proportion of annatto for the desired shade, a uniform color for different churnings may be obtained. When the annatto is cut by an akali, like potash, the coloring sometimes gives a slightly reddish tinge to the butter, while it is claimed that annatto prepared in the following manner produces a golden hue: Take two ounces of best basket annatto and dissolve it in a quart of soft, cold, water. It should be shaken well in order that the annatto may be thoroughly dissolved; then strain the liquid through a cloth, and add one teacupful of any good dairy salt,

and put the liquid in a bottle for use. To make a golden yellow, one teaspoonful of the liquid to six quarts of cream is added to the cream at the commencement of churning. Ordinarily it would probably be better to use some good prepared coloring, like any of those advertised in the RURAL. 2, From all we have learned with regard to home-made incubators, we would strongly advise our correspondent to have nothing to do with them, as an experiment in hatching with them is nearly certain to end in vexation and loss.

"Scours" in Calves.

J. S. P., Belden, O., asks how to treat calves that have the "scours."

ANS.—This disease, so fatal to young calves, is most common where cows and calves are housed, and among calves brought up artificially. Apart from hereditary tendency and the new demands on the digestive functions of the young thing, it is mainly due especially in calves brought up at the pail, to long fasts and subsequent rapid gorging, or to being compelled to drink sour, stale milk, sometimes given too warm. Sometimes, even when fed naturally, the milk contains injurious matters, owing to the cow being over-driven, excited, or having access to foul water, or on account of the milk having been retained too long in the udder. The early symptoms are:—a dirty tail, dullness, disregard of food and abdominal fullness, with fluid, bad-smelling yellow or whitish faeces discharged with violence or pain. As treatment, the patient should be removed to a clean, airy but warm box. If put on the milk of a farrow cow, it should have that of one that has calved more recently; and if the health of the nurse fails or the bag cakes, the calf should be supplied from a more healthy source. If the little thing is given to rapid drinking, an artificial teat in the pail for it to suck at will partially remedy the habit. The stomach should be cleared of irritating food and acrid discharges by a dose of one or two ounces of castor oil and a teaspoonful of laudanum. If the skin or membranes of the mouth, nose or eyes, are of a yellowish tint, two grains of calomel and 20 grains of chalk may be added and repeated daily for some time. In the absence of the yellowish tinge, give with each meal a tablespoonful of sherry wine in which one-eighth of the fourth stomach of a calf has been steeped for 24 hours. A tablespoonful of tincture of cinnamon, with 20 grains each of chalk and gum-arabic, will be an excellent addition. Finally, if the abdomen is tense or tender to the touch, it should be rubbed over with a thin pulp made of the best ground mustard and tepid water, and covered with a bandage to prevent drying until it has taken effect on the skin.

Cost of Growing Tobacco.

J. S. B., Monroeton, Pa., asks, 1, about what is the cost per acre of growing tobacco; 2, about what would be the yield on bottom land—a gravelly loam that yields about 50 bushels of corn per acre; 3, what would the product sell for when cured.

ANS.—The cost of growing a crop of tobacco per acre would depend much on circumstances, varying with the character and condition of the soil upon which it is to be planted. A gravelly soil, while it is well suited to the growth of tobacco, requires a greater expenditure of labor in the cultivation than a clay loam free from stones. Much also depends on the condition of the soil, whether it be in good tilth, free from weeds and weed seeds, or hard and lumpy and foul with weeds, all of which should be considered. Accurate accounts with a four-acre field of tobacco a few years ago by a friend with a view of finding its actual cost per pound, showed that the yield from the four acres was 6,020 pounds, or an average of 1,505 pounds, per acre. The cost, including manure, rent of land, shed for curing, together with team work, was about eight cents per pound, or $120 40 per acre. The cost of the labor alone would, of course, be much less, probably not more than $60 per acre. The yield which our correspondent will realize from his gravelly loam bottom land will depend on the amount and quality of manure he applies to his tobacco ground, and the culture which he gives the crop, and the season. A rich gravelly loam where clay does not predominate too much, that is not easily affected by drought, should, with good culture, produce a fine quality of tobacco, and with proper management, yield from 1,200 to 2,000 pounds of cured tobacco per acre. What a crop of tobacco will sell for per pound, is a question not easily answered. It will depend on the general quality of the crop, the way it is handled and the state of the market. Look at the market prices in the RURAL and do a little figuring on the above basis.

The Balm of Gilead.

A. L., Port Richmond, N. Y., asks, whether the tree called Balm of Gilead, a native of this country, is the same as the Balm of Gilead of the East—the kind mentioned in the Bible; and, if so, what part of the tree is used as medicine.

ANS.—Abies balsamea, or Balm of Gilead Fir, and Populus balsamifera *var.* candicans, the Balm of Gilead Poplar, are both known as Balm of Gilead simply, in many parts of this country. The true Balm of Gilead—that referred to in the Bible—is the Balsamodendron Berryii (B. Gileadense of De Candolle), a tree belonging to the genus Amyris, or Balm trees. It is a low tree or shrub growing in several parts of Abyssinia and Syria. To obtain the juice, the bark is cut at the time the sap is circulating the most vigorously. As the juices ooze through the wound they are received into small earthen bottles, each day's produce being poured into larger bottles and corked. Each tree is said never to yield more than 60 drops a day, so that the balm is very scarce and difficult to procure unadulterated, even in the East. It is used chiefly as a cosmetic, and taken internally in small doses to stimulate the stomach. The Abies balsamea furnishes the Canada balsam of commerce, a very transparent substance with a delicate yellow color and mild turpentine odor. It is used for the same purposes as copaiba, but chiefly for mounting preparations for the microscope and as a varnish. It is collected by puncturing the blisters on the bark, in which it gathers, and receiving the liquid in a bottle or other vessel. The Populus balsamifera *var.* candicans, is a variety of the Balsam Poplar, known also as the Tackmahack. A tincture made by putting the buds into spirits, was formerly a popular remedy for chronic rheumatism and pulmonary complaints. The resin of the buds, too, is apparently a stimulant, like turpentine and the balsams.

Fertilizers for Hops.

A. T. W., Brantford Ont., Canada, asks what is the best artificial fertilizer for hops. He is growing them on a black loamy soil, rich and deep, with a gravelly subsoil—a regular rich bottom land. Of late stable manure has failed to produce the ordinary quantity of hops, and he thinks that some lacking constituent might be supplied by a chemical fertilizer.

ANS. It is highly probable that the use of lime on this sort of soil, rich by nature and by frequent application of barnyard manure, would have an excellent effect. It is just on such soils that lime produces the best results, and its use in the hop-yard under like conditions has often quite or nearly doubled the yield. In the spring about a pint of air-slaked lime and wood ashes to the hill would serve as a good fertilizer and drive away grubs. The best results we have heard of, however, were obtained by applying a quart of fine unslaked lime to each hill in the fall, covering it with dirt and using no other dressing. In this case ordinary manure had been used liberally for the four previous years, and after the application of lime alone, the yield was more than doubled. A good special fertilizer is made of four barrels of ashes, two of plaster and one of salt to the acre to be applied in the spring after the hops have been tied up. Another is:—Six or eight parts of charcoal dust, two of pulverized hen manure and one of plaster. This is good the first year and afterwards. Wood ashes, plaster and bone dust are all beneficial together or separately. Either a compost of decomposed sod or barnyard and stable manure thoroughly rotted, is, however, the chief reliance in the hop-yard.

The Crescent Seedling Strawberry.

P. C. S., Hurlock, Md., asks what we think of the Crescent Seedling Strawberry for a market berry.

ANS.—We should not recommend it for planting in Maryland if to be shipped to New York, or anywhere else unless it be for a home market. It is wonderfully prolific and of fair size; but it is decidedly soft. Its bright color is in its favor, rendering it attractive at all times; the flavor is at least third-rate—poor. A peculiarity of the variety is that on extremely light land the berries are much firmer and better in point of flavor than when grown on any other sort of land, and it is so excessively vigorous the plants will maintain a footing anywhere

Miscellaneous.

S. C., West Northfield, Mass., asks 1, how can birds be kept from destroying cherries and other small fruit when it is against the law to kill them; 2. how can the large black bugs be kept off from young squash plants; 3. when Strawberries are in bloom and a small stream of water is turned on to the ground during the night, will it be a safe protection against frost.

ANS.—1. There is no way of doing so that does not cost more than the fruit is worth. 2. Insects may to some extent be kept in check on young squash and melon plants by dusting these with ashes, plaster, or even dry road dust. Not knowing what "black bug" is referred to, we can only suggest hand-picking and the crushing of the eggs if found on the leaves. 3. Practically it would not. Water in freezing parts will heat. It would require a considerable body of water to exert any marked influence.

H. A. T., East Troy, Wis., has secured from the Agricultural Department at Washington a quantity of rye grass seed, and he asks should it be sown with other grass seeds, or sown down with grain; is it good for pasture, and what is the best time for sowing it.

ANS.—What kind of rye grass? If it is Italian rye grass, that needs a moist, rich soil, and, being an enormous feeder, is usually sown by itself and cultivated for cutting green, yielding immense quantities of fodder in a season. It is often mixed with other grasses for pasture and hay, and is then seeded with a grain crop in the usual manner. If it is perennial rye grass (Lolium perenne) it should be sown in company with other grasses and not alone, as it has not the vigorous habit of the Italian grass. Either should be sown as early as possible in the spring, as in fact should all kinds of grass. Perennial rye grass has not so far succeeded in our dry climate.

Reader, Lewis Center, Ohio, asks, 1, which is the fuller and more complete, Chambers' Encyclopedia advertised in the RURAL for $10 for 20 vols., or Zell's which sells for $28; 2, is Chamber's Cyclopedia of English Literature a standard work.

ANS.—1, Chamber's Encyclopedia is much fuller and more complete than Zell's—the articles on each subject are longer, and more topics are treated of. The edition of Chambers' referred to contains the same amount of reading matter as the more expensive one; but the type is considerably smaller and so is each volume. 2, All Chambers' publications on educational matters are standard works, containing the best and latest information on the topics discussed.

G. A. A., Potsdam, asks how he can procure the annual reports of the Signal Service and also of the Commissioner of Agriculture.

ANS.—All the compilations published by the Government are, as a rule, divided among the members of Congress—Senators and Representatives—for distribution among their constituents, and we would advise each and every one of our readers to apply to the member for his district or State for any one of the works he may want, and although none of them is quite as interesting as a first-rate novel, they all contain a vast deal more useful information.

J. H. M., East Poultney, Vt., has a five-year-old cow that was lately due to come in; consequently, he began about six weeks before that date to dry her off; and after some difficulty he succeeded in doing so just about the time he became convinced she was farrow; and he now asks whether it is likely he can get a full milk yield again by milking her regularly, or if it would not be better to turn her into beef,

ANS.—Make beef of her unless she is worth keeping over the summer on pasture; the milk will not return to any considerable extent.

H. F. S., Winterburn, Pa., asks what kind of grass would be suitable for a very wet piece of land, and when should it be sown.

ANS.—For wet soils there are no better grasses than red top (Agrostis vulgaris), and fowl meadow grass (Poa serotina). Creeping bent (Agrostis stolonifera) makes an excellent addition to the above two species. The seeds—1½ bush. per acre in all—should be sown as soon as possible.

A. R., Paducah, Ky., asks whether there is any book that gives instructions as to the treatment of stallions and jacks during the season.

ANS.—There is no book which has information about jacks; "Stonehenge on the Horse" refers generally to the management of stallions, and that applies equally to the ass as to the horse.

J. M., Selma, Ala., sends some seed for identification.

ANS.—Sweet clover, Melilotus alba.

Educational.

PRESIDENTS OF AGRICULTURAL COLLEGES.

OUR agricultural colleges have been making very moderate progress during the six to sixteen years since they have been respectively organized. The act of 1862, granting a large fund in lands to the several States for the equipment of these colleges, should justly mark an era [illegible] agricultural progress. Its purpose [illegible] lay the foundation of scientific and practical schools of agriculture and the mechanic arts. The law is entitled, "An act donating public lands to the several States and Territories which may provide *colleges for the benefit of agriculture and the mechanic arts.*" The fourth section of this act declares that the "leading object" of these colleges shall be "to teach such branches of learning as are related to agriculture and the mechanic arts." It is perfectly plain that the framers of the law intended these as special, and not as general schools. However much general learning the presidents of these colleges possess, it does not and can not atone for a want of the special knowledge required for the management of institutions devoted "to teaching such branches of learning as are related to agriculture and the mechanic arts" This was so obvious at the first glance, that no one could come to any other conclusion unless the "wish became father to the thought."

Yet all of these institutions were organized by the appointment of presidents in total disregard of the spirit and letter of the law—by placing a purely literary man, having no knowledge of, and generally not even any taste for, rural pursuits, at the head to direct the teaching of scientific and practical agriculture and the mechanic arts. Many of these presidents devoted their public addresses, for several years, to special and labored arguments, attempting to show that the law did not intend these colleges as special schools of agriculture and the mechanic arts, but that they were broad enough to include a general and universal education. This was to justify their action in making them merely literary institutions, with a farm manager giving a few lectures on general agriculture, a chemist and a botanist, sometimes with a machine shop. The result has been that the great mass of the students, nine out of ten, have pursued precisely the same studies—and no other—as they would at any literary school before the organization of these colleges. This ratio is too small for the Michigan and Massachusetts colleges; but large enough to meet the facts of all the rest.

It may not be amiss here to show how widely they have deviated from the intention of the framers of the law, by quoting a paragraph from the speech of Senator Morrill, the author of the bill, in advocating its passage. He certainly ought to know what was intended by the law which he introduced. Answering the objection that they would compete with the colleges existing, he says: "Our present literary colleges need have no more jealousy of agricultural colleges, than a porcelain manufactory would of an iron foundry. *They move in separate spheres, without competition.* * * The farmer and mechanic require *special schools* and *appropriate literature*, quite as much as any of the so-called learned professions. We need careful, exact and systematic registration of experiments. We need to test the natural capability of soils, and the power of different fertilizers; the relative value of differents grasses for flesh, fat and milk-giving purposes; the comparative value of grain, roots, hay, peas, carrots, potatoes or turnips in pounds of beef, pork or mutton; deep plowing as well as drainage; breeds of animals; remedies for the potato disease, and for all the tribes of insects destructive to crops."

What countenance does this give to a general education in these colleges? He says, "the farmer and mechanic require special schools and appropriate literature," but the presidents of those colleges, utterly disregarding the law, turn them into ordinary literary colleges, in which nine-tenths of the students are educated without any reference to agriculture and have no intention of pursuing it. The Academy at West Point is a special military school, but it would be doing greater violence to its intended character, were nine-tenths of its cadets permitted to pursue a mere literary course without regard to military sciences, than is the course pursued at these so-called agricultural colleges a violation of the law under which they organized. And the "special schools" spoken of by Senator Morrill were intended to be as special in relation to agriculture and the mechanic arts, as is the West Point Academy to military science.

But perhaps the late election of the Massachusetts Agricultural College is the beginning of an important movement in the reformation of these colleges. It is so new and refreshing as to require special notice and recognition. We refer to the announcement that Prof. Levi Stockbridge has been elected the fifth president of this college. This is an election "fit to be made." It recognizes special fitness for the duties to be performed, and is the first indication that a purely literary training may be dispensed with in the head of a special college devoted to agriculture and the mechanic arts. Prof. Stockbridge has been the working, vitalizing force of that college since its organization, comprehending the duties of such an institution, and now they have tardily concluded to give credit for services performed, and acknowledge fitness proved. This is a precedent that will bear frequent repetition. Let us hope that these colleges may, in time, be redeemed and given the special character intended by the law. PRO BONO PUBLICO.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

CONDUCTED BY
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, MAY 1, 1880.

REMOVAL.

THE RURAL NEW-YORKER is now in its new quarters, No. 34 Park Row, corner of Beekman Street.

AT first glance it may appear that forcing plants and fruits by the use of the electric light is not likely to prove of any practical utility. It can never be of as much value to us as to English horticulturists, it is true, but we often stand greatly in need of sun during occasional winters, and almost invariably there are periods when plants suffer and flowers are backward from need of sunshine. Further experiments by Dr. Siemens seem to demonstrate the power of the electric light to ripen fruits and to color flowers. If the cost of its production can be reduced to a nominal sum, no doubt the American gardener will have occasion to avail himself of its use as well as the English gardener, though never perhaps to the same extent. At a late meeting of of the Royal Society, Dr. Siemens showed two pots of Strawberries which had been treated the same, except that one had been subjected to the electric light for a fortnight and the other had not. The plant which had been all the while exposed to light (*i. e.*, sunlight during the day, electric by night) bore far more vigorous leaves and of a darker color than the other which was not subjected to the electric light. The berries of the first were at least a week further advanced than those of the other. Of 16 berries, 14 were colored and for the most part ripe. Upon the other, of 14 berries only one was colored, while the others were entirely green.

DURING the month nearly 34,000 immigrants had arrived at this port on Saturday evening, April 24; 40,000 was the greatest number that ever arrived here in April, and it is confidently expected that that number will be equaled, or even exceeded, during the six remaining days of this month. The Irish and Germans, as usual, head the list of nationalities that have contributed to this tidal wave; but it also includes large contributions from countries that have hitherto contributed only in a small way to the population of this country. The number of Italians and Hungarians has notably increased. while Danes and Norwegians have likewise come in an unusual flood. The character of the immigrants is considered much better than the average, a circumstance due in a great measure to the fact there is among them a large proportion of farmers and mechanics. In former years of heavy immigration the vast bulk of the newcomers were either forced to stay in this city or neighborhood, or at least in the Atlantic States, by want of means to take them elsewhere or they elected to remain here because ignorant of the superior advantages of other sections. This year, however, the authorities at Castle Garden say that a very large proportion of the immigrants go directly to the West, having procured "through" tickets in Europe, and that a comparatively small share only of the mighty influx remains at the East.

WE learn from our correspondent in South Carolina that peaches and fruits generally thereabouts are either badly injured or destroyed. Fig trees, the Japan Persimmon, potatoes, green peas, corn, etc., were also injured. There is a nook in the mountains of western South Carolina, however, that seems to have escaped the effects of this severe and untimely frost, though 150 miles north of the country of which our Aiken correspondent speaks. This "nook" is locally called "Thermal Belt." It is a strip of land extending for a short distance along the south side of the mountains between Spartanburg and Hendersonville, and while within a few miles of it in any direction severe frosts at this season are not rare, it is very seldom that even light frosts occur in the "Thermal Belt" to harm the tenderest buds of spring. No doubt some of the causes which contribute to the successful culture of fruits in the Belt are also conducive to the well-being of those who seek the contiguous valley as a health resort. The air is surprisingly dry and the grass as free from dew at sunrise or in the evening as at midday. The elevation is midway between that of Aiken, which is 700 feet above sea-level, and Asheville or Hendersonville, which are about 2,200 feet above. Protected on all sides by mountains, the climate is an intermediate one, escaping the rude blasts of the Asheville and Hendersonville mountains, on the one hand, and the somewhat enervating heat and sultriness of Aiken, on the other. We receive these facts from a trustworthy source, and cannot doubt that the region of country of which we are speaking is destined not only to become famous as a fruit belt, but as one of the most effective health resorts in our country.

SUBDIVISION OF LAND IN FRANCE.—The consequences of an absurd law are well stated in the following terms by Mr. Richardson, an English agricultural writer.

In France, the law says, "Each one of the co-heirs may claim his share of the real and personal property;" and "in forming the portions of each, it is as well to avoid, as far as may be possible, cutting up the inheritance, and also well to give each co-heir the same quantity of real or personal estate." The courts have interpreted this to mean that a division must take place, if claimed, and have quashed wills which made a disposition to one heir of the real estate, to another of the personal, or gave to each co-heir a separate real estate, although the value of each might be fairly apportioned. The consequence of this is a continual division and subdivision of plots of land, until at last no cultivation is possible except with a spade, and in some cases the spade must not be a full-sized one; and a tree cannot be planted on an estate because it is illegal to plant one within two yards of your neighbor's boundary, and your neighbor on each side is within that distance.

It would seem as if compression such as this must soon lead naturally to violent disruption of the existing order of things and to new arrangements. There was a story some years since, when rifled cannon were first invented, to the effect that a German Grand Duke having bought one of the new guns for the use of his "army", was forced to make treaties with two neighboring dukes before he could introduce artillery practice. The more distant neighbor gave him leave to set up a target in his domain, and the other granted permission to fire across his land. In this particular instance it was not long before United Germany "rectified the boundaries" and "absorbed" the three potentates.

THE speculators who, last fall and winter, ran up the price of wheat far beyond what the ratio of demand and supply justified, are likely to be pinched pretty severely before they can unload the twenty to thirty million bushels which it is estimated they still control. Already much, if not all, of the profit they made on the rise, must be lost by the fall that has occurred, despite their best efforts to keep up prices. A glance at our market reports in the issue for Jan. 3, will show that on Dec. 27, No. 2 Chicago spring wheat was worth $1.33⅞; whereas, as seen in this issue, the same grade was worth last Saturday, the 24th, only $1.12—a drop of 21⅛c. Doubtless, however, in the meanwhile, the chief manipulators of the ring have profitably shifted much of their load on other shoulders, besides selling a good deal of their stock at a fair profit. The fall, however, has not ended yet, and in the next few weeks it is likely to be much more rapid than it has hitherto been. Besides miscalculating somewhat the extent of the shortage of cereals elsewhere, the ring did not reckon upon the obstinate unwillingness of our foreign customers to pay the exorbitant prices demanded by this handful of greedy speculators unscrupulously seeking from the distress of Europe to enrich themselves. Owing to the high prices for breadstuffs brought about by their machinations, our foreign customers have been economical in their use, besides substituting for them, to an unusual extent, other articles of food. Moreover, other nations who had a surplus of wheat, acted in the same way, in order to be able to sell the more at the high figures offered. Thus it happens that with the prospect of an abundant harvest everywhere, and the certainty that some of it will soon be in the market from India, Northern Africa and other warm regions, the ring now finds itself heavily burdened with a load, most of which was bought at higher figures than those at which they can reasonably expect to dispose of it. Well, there will be few mourners over any loss they may incur. Their selfish greed has sorely pinched starving millions, seriously injured trade and commerce, made our foreign customers seek other markets and stimulated to greater efforts our foreign rivals.

FISH CULTURE AS ONE TERM IN A ROTATION OF CROPS.

THE following bit of European experience is of interest as bearing upon the culture of carp and other pond fishes, a subject which is beginning to attract considerable attention among farmers in this country.

In eastern France, at the base of the Jura mountains, there is a tract of about 180,000 acres, formerly called Dombes, which is or was so covered with ponds, largely artificial, that a map of the region is said to have shown as much water as dry land. A curious system of rotation has long been practised there consisting of the alternate culture of fish crops and grain crops; or, latterly, of fish, grain and grass. The ponds are kept full of water and stocked with fish for three or four years—two-year-old or three-year-old fish being bought for the purpose of the breeders. In due season, when the fish crop has ripened and been sold, the sluice-gates are lifted and the water drawn off, there being no difficulty in laying the bed of the pond dry, since the whole district lies on a slope from which water flows away readily. Simple ditches and furrows are opened to dry the pond bottom which is then plowed and kept under cultivation during three or four years. Abundant crops are obtained, although no manure is added. Indeed, the soil is sometimes so rich that there is risk, during the first year of cultivation, that the grain crops may run too much to straw. In some cases oats and barley are grown and in others, where the land is of better quality, a crop of wheat is taken the first year and two crops of oats in succession after the wheat. Sometimes the grain is followed by grass, though this seems to be a modern innovation specially applicable to cases where the ponds are to be drained permanently. In this event the ground is readily converted into good pasture.

The soil of the district is a stiff clay, impenetrable to water, such as would have been extremely difficult to cultivate by ordinary methods in the days before tile-drains and other modern appliances had been discovered; and it is from this circumstance doubtless that the peculiar system now in question had its origin. The land is so thoroughly fertilized by the water that the crops obtained from it are all excellent, and it is to be noted that when the practice was maintained in its purity all the crops were of kinds immediately merchantable. The system was formerly held in high esteem and, as a mere matter of farming, was undoubtedly excellent, but a very serious objection to it is its unhealthiness, and it is now discredited on this account. There were not only too many ponds in the district, but the alternate soaking and drying of the land was pernicious. Of late years, the tendency has been to drain the ponds permanently and to grow forage upon the land for the support of stock, according to ordinary farm methods. Quite recently a company, aided by Government, has done much work in the way of draining the ponds methodically. It is said that the public health has been distinctly improved, as a result of the permanent drainings, and that malarial fevers are still slowly diminishing in the district as the work goes on.

BREVITIES.

IT appears that in 1878 we imported 17,549 ounces of quinine. Last year this amount was increased to 228,348 ounces.

THE general prosperity of our country is something so new and entertaining that politics are obliged to take a back seat.

PROFESSOR Shelton, of the Kansas State Agricultural College, it will be seen, advises our Western readers to plant "King Phillip" corn.

TWO plots six feet by four, of rich, sandy soil (if watered when needed) will supply a family of four with crisp, tender radishes from the first of June until the middle of October. Radishes are worse than worthless unless they are fresh and tender.

MANY farmers and especially farmers' sons cannot rid themselves of the fascination of breeding horses for speed. It is well for them to bear in mind that weight, endurance and strength are what are most needed on the farm and that speed is not compatible with those qualities.

JUDGE PARRY states in his "Forty Years Among Small Fruits" that "Queen of the Market" was introduced by J. R. Helfrich of Jersey City, N. J. Does Mr. H. know anything of its parentage? Speaking of the Cuthbert, Judge Parry, says: "It is a fruit of the same character and may be classed with the "Queen of the Market" which it much resembles in large size and fine appearance, and it has probably descended from the same healthy parentage.

REFERRING to our Editorial in last issue, Professor W. J. Beal, of the Michigan Agricultural College, writes us that that college is already, in a small way, raising the best procurable hardy grasses for seed. So far, however, the quantity obtained has been very small—only enough to supply several other agricultural colleges and a few private individuals. The grasses, he well remarks, can never be accurately grown except under the eye of a *good* botanist.

THE Western Rural informs us that there are parties selling the Chinese Hulless Oats in Ohio at $10 per bushel. Seedsmen, both East and West, are offering them at from $1.50 to $2 00 Readers of the RURAL NEW-YORKER could scarcely be deceived into paying such a price for the Hulless Oats. We have raised them at the Rural's farm and our reports as to their value could not have escaped them. It is a prolific variety, the only objection being that if left until ripe, a considerable proportion of grain is lost.

WE have had an unusually large number of requests the past season that we would send the RURAL NEW-YORKER and wait various lengths of time for payments. The requests are entirely reasonable. Many journals do not require pay in advance; many journals are sent for several years or until requests of discontinuance are received. It is a matter for each journal to decide for itself. The RURAL NEW-YORKER is invariably discontinued at the end of the subscription term and we invariably require pay in advance. It seems to us the only business-like manner of conducting the newspaper business.

THE agricultural editor of the New York Sun speaking of "Pearl" (Cat-tail or Horse) Millet, says: "We have had occasion to refer to it during the past three or four years, and have now *nothing to add* or *take* from our former statements in regard to it. *We will say, however*, that it is *not* adapted to the more Northern States, and north of the latitude of New York City it will not succeed except in warm light soils and in very favorable seasons. The italics are ours. The editor of the Sun has "nothing to add or take from former statements!" "*We will say, however*, etc."—is not that an addition or a subtraction? What is it? How diplomatic! The agricultural editor of the Sun ought to have been a statesman.

JUDGING from the experience of the past months of this year, and especially of last week, this is likely to be remembered as the cyclonic year. Never within our remembrance has there been a land storm so wide, so long, so terribly destructive of life and property as that whose track, last week, through Kansas, Missouri and Illinois, was marked by disfigured corpses and maimed survivors, by leveled homesteads and wrecked villages, by uprooted trees and general ruin. Far on each side of its general course other storms less in extent, though hardly less in violence, have also wrought a world of desolation, while away on the Pacific coast, beyond the barrier of the Rocky Mountains, the telegraph has just announced a rain and wind storm of unprecedented severity.

AS foretold here a few weeks ago, Dr. Albert R. Ledoux, late Director of the North Carolina Experiment Station, has just opened an agricultural business laboratory in this city. The nature of the business and the address at which it is carried on are told in our advertising columns, and it need scarcely be mentioned to our readers that Dr. Ledoux is fully competent, both by high professional ability and wide experience in his chosen pursuit, to confer a lasting benefit on the farmers and others who may consult him, by the accuracy of the information he can impart. North Carolina's loss is likely to prove a gain not to New York only, but to all the neighboring States whose farmers can avail themselves of the Doctor's services.

LAST Thursday, when the Senate joint resolution directing the Committees on Agriculture to consider generally the subject of agriculture came up in the House, Mr. Reagan, of Texas, submitted an amendment directing the Senate and House Committees to inquire into the effect on the agricultural interests of the country of adopting a tariff for revenue only, instead of the present protective tariff. Mr. Garfield objected, whereupon Mr. Reagan charged that the protective tariff cost the agricultural classes $800,000,000 per year on account of the higher prices they have to pay for goods, and that in return they only receive the flattery of vague platitudes. "The flattery of vague platitudes" is good as applied to all the farmers of the country have received from the Government.

IN England the late winter and early spring have been all that the farmer could desire for starting the grass and putting in his crops. Fall-sown wheat, though a trifle backward, and the late-sown thin, is, on the whole, in fine condition. In Scotland the weather has been equally favorable, and seeding is about three weeks earlier than last year. In Ireland, the weather has been somewhat wetter and the work, therefore, is not quite so forward, but there are good hopes of a fine crop next harvest. Potatoes are mostly planted, and the seed potatoes sent out by America on the Constellation are being rapidly discharged and forwarded to the distressed districts for immediate planting. France has been blessed with fine seasonable weather, and all crops are in an excellent condition, especially the fall-sown wheat which has an unusually bright, healthy appearance, due to late rains and genial days. Oats, barley and particularly rye, are also in excellent trim. In Germany the weather has been dry, bright, but very cold, especially in the northern part, yet reports of the growing crops are favorable, except oil-seeds which were severely injured by a late cold snap. The spring is backward in Russia. The slight advices from northern Africa speak favorably of the agricultural prospects, especially in Algeria, which has lately been cheered with abundant rains.

Literary Miscellany.

THE WOODPECKER.

BY LAURA S. HAGNER.

TAP! TAP! goes the woodpecker's busy bill,
Tap! tap! on the old oak tree,
He hunts small game
With his tongue of flame,
For a woodman bold is he!

"'Tis the early bird gets the worm," he cries
As he flies from his nest at morn:
And his cry so shrill
The woodlands fill,
Like the hunter's bugle horn!

In their chamber dark
'Neath the moldering bark
The grub and the worm lie still;
But he hurries them out
With a terrible rout,
And gobbles them up at will!

Natures own red republican,
He sings and steals, and fights
And from the ash tree's highest limb
Harangues about "his rights."

'Tis a melancholy truth,
Not in bird-land alone,
That those who trample others' rights
Still clamor for their own.

JOHN ASCOTT'S DAUGHTER.

BY CHARLES RICHARDS DODGE,
Author of "Louise and I."

CHAPTER I.

AN ALTERNATIVE.

"FATHER, I want to buy a farm."

"You want to—what?"

"Buy a farm, I said."

"Buy a fiddlestick," said Mr. Ashton, with a contemptuous glance. "Want to sink some money, do ye?"

"Yes—to the extent of paying for the land."

"Umph! Well, why don't you buy it then. You've got the money your aunt left you, and you are of age?"

"Yes—but—" the young man hesitated.

"'Yes, but—' what?" growled the old gentleman, perching his spectacles upon the tip of his nose, and looking hard at his son.

"Aunt Jane's money is'nt quite sufficient for the purpose."

"And so you've come to ask me for the balance?"

"Well—yes—that is, if—"

"If I am dum fool enough," interrupted the elder, "you've made a failure of everything else you've tried since you left college, and now—"

"But no money was involved."

"Simply because you had none to involve; so this time you propose to go the whole figger. A farm! what in the name of common sense would you do with a farm? You could'nt keep books for Mallery & Richards, at eight hundred a year; how on earth could you keep your own?"

"You know, father, it was too confining.

"You thought you'd be a writer and you scratched away for half a year, and then gave that up."

"I had no encouragement to go on, for you very well rememb—"

"Then you took a sewing machine agency and never made a dollar at it."

"The business was done to death. Besides, I went into it against my inclination."

"Well, I have'nt advised you to go to farming, have I?" Mr. Ashton snappishly asked, resuming his newspaper.

"No, but you drove me into a scientific school by refusing me a regular academic course unless I would take up law at its close. I hate law—and lawyers too, as far as that goes."

"You young chaps seem to know better what's for your good than your father's do. It want so in my day. However, I don't see what the scientific school has got to do with it."

"It gave me the theory of farming. I studied agriculture and zoology."

"Nonsense, and how to catch butterflies," Mr. Ashton, interposed, turning his paper inside out.

"And chemistry and modern language, if you will remember. I chose the course that seemed most to my taste; and I must now choose a pursuit in life in the same manner."

"Headstrong as ever," was the only reply the old gentleman deigned to make, and he resumed his reading.

George Ashton had never been a favorite with his father, was never understood by him. father and son viewing life through as totally different spectacles as could be possible. Mr. Ashton's ideas of parental authority were of the old school, his *ipse dixit*, right or wrong, being final. He had endeavored to rule everybody with whom he came in contact in the way in which he ruled his household, until he had fairly earned the name of a "dogmatic old curmudgeon." He had early marked out a life career for each of his three sons; two of them had followed it as a matter of course, and with fair ability and a good capital, they were plodding along comfortably. But George, the youngest, was of a different disposition. He was averse to going into trade, so his father decided upon a profession for him, and will he, nill he, the young man must follow it, or incur the parental displeasure. As a matter of course, the parental displeasure was incurred, and a stormy time they had of it at home, until, as a compromise, George was packed off to a scientific school. Here he found himself his own man, for the old gentleman was so disgusted that the only advice offered at parting was to "keep out of mischief and study something, whether useful or not.

"And you are really determined to go to farming?" asked the old gentleman at length, laying down his paper.

"I think I could make an honest living at it."

"And how much money am I expected to furnish?"

"About two thousand doll——"

"*What?* Two thousand dollars in addition to your aunt's legacy!"

"That makes but little more than six thousand in all."

"Six thousand dollars to sink in a farm?" Mr. Ashton whistled a bar of "Napoleon crossing the Alps," and added; "must be a mighty fine farm at that figger."

"Would you have me buy a place wholly run down, for half the money?"

"Couldn't you run it up again and put the odds in your pocket? If the land is there you ought to be able to put enough of the science you got at college into it to more than make up the difference."

"Bringing up worn out-land covered with dilapidated buildings and tumble-down walls or broken fences, may do for a pastime, but I prefer to put my money into it all at once, and make a fair start from the beginning. It is the cheapest way in the long run, and I didn't learn that at college."

"Umph!" Another silence.

"Can you let me have the money?" the young man asked after a reasonable pause.

"I'll think about it, but where's your farm?"

"The old Ascott homestead——"

"The old Harry!"

"And in the spring I intend to get mar——"

"*What?*" Mr. Ashton turned squarely round in his chair, dropping his paper upon the floor.

"It's a natural thing for a man to do. My father did it before me."

"And I suppose after you get the homestead, you'll expect old John Ascott's pauper daughter to keep house for you."

"Father!" exclaimed the young man with astonishment, "May Ascott is a *lady* if fortune *has* dealt hardly with her."

"Eh! I've hit the nail on the head, have I?"

"I have asked May Ascott to be my wife, so there is no going back upon that now."

"And you are asking me to help buy old Ascott's land to give it back to the daughter he left penniless."

"I asked you for two thousand dollars to help buy *me* a farm. That is not a third of the amount you gave Will when he went into business, and you know what Charlie has had."

"I know what you asked, but hark ye! I made up my mind once to have you study law and become an honest, respected member of society, you thwarted me in it, and went to a college where they taught 'science' instead of common-sense. I decided to have you go into your Uncle William's pork-packing house. You refused because you felt too nice for the business, and I let you follow your own course until you failed in it. I proposed to get you a clerkship in Washington, but somebody told you it unfitted a man for anything else and you fooled me again. Now that I forbid your marrying John Ascott's daughter, I suppose you'll do as you please about this also. But bear in mind, *not one cent of my money goes into a farm if the Ascott gal becomes an Ashton;* and not one cent of my money do you ever get if you disregard my wishes further."

"What are your objections to the girl?"

"She's an Ascott, and that's enough for me—but no more parleying, I won't hear it;" and Elbridge Ashton beat a hasty retreat, leaving his son in a most unenviable state of chagrin, disappointment and anger. He stood in thought a moment, leaning against the marble mantle, his eyes fixed upon a figure in the carpet, his brows knit and teeth set; then he looked toward the open door through which his father had vanished, and muttering to himself, "unreasonable and unforgiving," strode out of the house

CHAPTER II.

THE ASCOTT HOMESTEAD.

George Ashton could not remember when he first saw the stately old house; but it must have been in his earliest childhood, for his sweetest boyish recollections were associated with the old place. Prospect road was a famous drive from the city, and commanded a stretch of landscape, for miles, only broken on the extreme right by distant hills—the beginning of a mountain chain—while the intervening country was checkered with fields and meadows, forest and intervale. Upon the left, in charming contrast, lay the quiet city, nestling amid great elms and almost hidden by their heavy foliage: just beyond, the blue waters of the bay sparkled in the sunshine, a dark line against the horizon indicating the distant ocean.

The house occupied the highest point of Prospect hill, and as the visitor turned from the road, and paused between the huge stone posts that flanked the carriage-way, he only saw before him a smooth, hard drive way, winding through a grove of maples, that wholly shut out the surrounding landscape. In a couple of hundred yards however, it turned sharply around a clump of evergreens, and the house appeared but a dozen rods distant. It was a pleasing picture, with its wide old fashioned doorway protected by a portico as solid and substantial as the great block of granite that served as its floor, with its high gabled roof and projecting eaves, where the wasps loved to build their papery nests, and with its quaint dormer windows.

In those happy days it was known as Maplewood; and the Ascotts, who had been its occupants for several generations, were as plain and substantial as the old homestead itself. John Ascott was a well-to-do farmer, who, combining a proportionate amount of theoretical knowledge with the hard, practical common-sense, inherited with the land, from his father, had brought the farm, though not a large one, to the highest state of tillage, and himself to prosperity. At this time the immediate family consisted only of Mr. Ascott and his little daughter May, who alone was left to remind her father of the sweet mamma that had passed to the spirit land in the child's infancy.

John Jr., and William, older children by a former marriage, had grown to manhood, and had gone forth into the world. John, his father's idol, was in the West making a name for himself; but William, indulged and petted in his youth, wild and ungovernable in his later years, had gone to New York, and the family seldom heard from him, and only then when he needed money to make good the losses of reckless speculation—which it was more than once surmised were gambling debts. At this time George's father owned a country seat, Ashton Villa as he called it, adjoining Maplewood. Here George spent his childhood, with sweet May Ascott, his nearest neighbor, and playfellow, roaming the old place over in childish fancy, filled only with the simple joys of boyhood, and happy in his ignorance of the great earnest life that opens to all when childhood's hours have passed away. How memory pictures to him now the sheltered sunny slope when through the long summer days, they played house together, arranging bits of broken china and old-fashioned blue crockery upon dressers of pine shingles, as proudly as though their "play pretend" were all reality, and the fragments the richest products of the Orient. It is a picture of boyhood that the man will never forget; and it seems to him but yesterday that she came and laying her little flaxen head upon his knee, her face radiant with the new suggestion, whispered; "Georgie, let's play I'm your wife and this is our little house."

Oh, happy, careless childhood, filled with innocence and trustful confiding love! Oh, joyous springtime! Would your sweet flowers might bloom perennial in the heart, and exhaling their soft fragrance, brighten life's pathway with more than memories of happy hours!

All this was many years ago, and time wrought sad changes for them all. Need I dwell long upon the dark news that told John Ascott, one spring morning that his favorite son had been killed by an accident—only a brief month before he was expected to visit home; how William had become entangled in "speculation" with hints at darker doings, that had swept away Maplewood almost in an hour; how the broken-hearted father bowed his gray hairs in shame and anguish, and ere the spring-time came again, had passed away, leaving his little daughter, a sad-faced child of ten years, alone in the world. The childish friendship which had existed for many happy years, was broken; May was offered a home in the family of a distant relative in another State, and her early friend and playfellow saw her no more. In those darkest days of honest John Ascott's life Mr. Ashton loaned him money—which the man was never able to return—through no fault of his. Those were sad days, indeed, for a few months after Mr. Ascott's death George's mother called him to her bedside, and, giving him her blessing and a mother's parting kiss, fell asleep; and one fair June morning they laid her beneath the violets, and George, too, felt himself alone. Never his father's favorite, his mother had always been to him the dearest friend he had known upon earth. In disposition, and in many of his tastes he was like her, and between the mother and the son there existed a sympathy which admitted of no misunderstanding, and which drew forth all the gentleness of his nature.

After his mother's death, the father assumed to be George's guide and teacher, with what success may readily be imagined. George felt that never was boy so cruelly misjudged and misunderstood, while the father openly averred that never was boy so obstinate and perverse. So he passed his youth, his mind filled with half-formed fancies, his thoughts occupied with plans with which he knew his father had no sympathy, and to which he would not listen; and at the age of eighteen, he found himself drifting, with no fixed purpose in life, unless it were to thwart the ill-advised schemes of his father concerning him. Then he went to college, entering a course of instruction at first dictated by fancy, but afterwards pursued for the keen enjoyment it afforded him, trusting in the hope that it might, some day be useful to him in fighting life's battle.

It was near the close of his college course, and of his minority, that an incident occurred which perhaps, changed the whole course of his after-life; at least it formed a most important link in this truthful narrative.—[To be continued.]

HAWEIS ON VIOLINS.

Lecture by a popular London preacher at the the Royal Institution—Stradiuarius and the Amati—a fashionable amusement.

THE following article taken from the New York Herald, is published by request. No doubt it will be interesting to many readers.

A most interesting and original lecture on violins has been delivered by the famous and Reverend Mr. Haweis, in the theatre of the Royal Institution, in the course of which the Duke of Edinburgh's Stradiuarius violin, dated 1723, and another, which is the property of the Russian Imperial family, were exhibited; also a Caspar di Salo bass, found in Tarisio's bedroom with his corpse, and many specimens of great value and rarity from the South Kensington Museum. The lecturer said:—"I deal to-night with the construction, the history and the sound of the violin. To begin with the wood. At Brescia makers used pear, lemon and ash; at Cremona, maple, sycamore and, of course, pine. The wood came into the markets of Mantua, Brescia, Cremona, Venice, Milan, from the Swiss Southern Tyrol, unlimited in supply, often mighty timbers of great age—plentiful then, scarcer now. The makers had their pick; they tested it for intensity and quality. Cut strips of wood and strike them; you will see how they will vary in musical sound. When a good acoustic beam was found the maker kept it for his best work. In Joseph Guarnarius and Stradiuarius the same pine tree crops up at intervals of years. A good maker will patch and join and inlay to retain every particle of tried timber. Old wood is oddly vocal. As I sat in my room, surrounded by these instruments, I could not cough or move without ghostly voices answering me from the sixteenth, seventeenth and eighteenth centuries, and even the old-seasoned backs and bellies of unstrung violins are full of echoes. The supreme interest of the violin is not far to seek. It lies not only in its simplicity, beauty, strength, subtlety and indestructibility, which fit it for the cabinet of the collector, but it is the king of instruments in the hands of the player. It combines accent with modification of sustained tone. The organ has sustained tone without accent, the piano accent without sustained tone, the violin accent and sustained tone modified at will. Within its limits it is scientifically perfect; it has all the sensibility and more than the compass, execution and variety of the human voice. The violin is not an invention, it is a growth; it has come together; it is the survival of the fittest."

ANCESTRY OF THE VIOLIN.

On the screens were hung a variety of queer looking old instruments, whose endless shape and style, as the lecturer pointed out, showed the inexhaustible fascination exercised by the viol tribe over the human mind. Out of the rebek, the crowth, the rotta and guitar came forth the modern, or comparatively modern, violin—the most perfect of musical instruments. "About the eleventh century an instrument of the viol tribe emerged with frets, but 150 years were required to get rid of these marplots before even a step toward the true viol could be made. Before the end of the fourteenth century viols were made in great profusion, of every size and shape—the knee viol, the bass viol, the viol de Gamba, of which certain South Kensington specimens are before you. But the rise of the true violin tribe begins with the rise of modern music. About the time when Carissimi and Monteverde—1565-1672—discovered the true octave and the perfect cadence, part singing received a new impulse; the human voice was discovered to fall naturally into soprano, contralto, tenor and bass and viol instruments being adapted to these four divisions, the violin, tenor, bass and later contrabasso, before me, gradually separated themselves from the confused *nebulæ* of viols behind me, and shone out clearly as the true planetary system of the musical firmament." The lecturer then spoke of the violin makers of Brescia and Cremona, Gasper di Salo, Maggini, Andreas Amati and Nicholas Amati, the last named being the master of the great Antonius Stradiuarius himself. "For thirty years," explained Mr. Haweis, "this extraordinary man was content to work under the acknowledged influence of N. Amati. In 1668 he sets up for himself, but copies Nicholas till 1686; from 1686-94 his form fluctuates, but inclines to the earlier Brescian model (not in the corners), grows flatter, corners bold and full of character. In 1687 he makes the long or rather narrow model, which he did not adhere to. In 1700-3 he enters on his golden period after countless experiments. The last trace of the Amati scoop had disappeared. Some of the finest violins of the 'grand' pattern were made 1720-5. They have all the grace and boldness of a Greek frieze drawn by a master's hand. The arch of the belly, not too flat nor too much raised, is the true natural curve of beauty; on each side the undulating lines, as from the bosom of a wave, flow down and seem to eddy up into the four corners, where they are caught and refined away into these inimitable angles. The scroll is strong and elegant, the sound holes exquisitely cut. The varnish is not hard and silicate, but mellow as amber or sunlit water. There is a violin of 1736, bearing date and name; it was made in the master's ninety-second year. He made down to the last, but latterly seldom signed his work. Alas! that has been since done for him by thousands who would be at pains to make even a respectable tub." Finally, the lecturer brought one of the ablest and most interesting lectures which has ever been delivered in London to a close by playing on several violins, one after another, by way of illustrating their different tone quality. It is not often that the sober-minded English have an opportunity of seeing a clergyman fiddle in public, but now that a royal duke and a parson—the Church as well as the State—have handled the bow before an audience the love for the fiddle must become popular. It would not surprise me to hear that the latest fashionable accomplishment for ladies instead of lawn tennis is to cultivate what Addison terms "the only sensual gratification which mankind may indulge in to excess without injury to their moral or religious feelings."

MAGAZINES FOR MAY.

SCRIBNER for May is full of interesting material on subjects of general or timely interest. In addition to the book notices, Literary Criticism is represented by M. E. C. Stedman's study of Edgar A. Poe. Art Criticism is represented by a paper on "The Younger Painters of America," the first of three by Mr. Wm. C. Brownell. The other papers will follow soon, and will include the most vital work of the "new men." Modern Progress is represented by the second of Mr. Theo. De Vinne's papers on "The Growth of Wood-cut Printing." History is attractively represented by Schuyler's "Peter the Great," which is being studiously read all over the country. Out-of-door Life is recorded in Burrough's "Notes of a Walker," in which he replies to criticisms on his recent enumeration of some inaccuracies of American poets in dealing with nature. Timely Topics are represented by a paper on "Economic Defects in Christian Missions," which will interest the Ma missionary meetings; by a paper on "Congress and International Copyright," Fiction is represented by Mrs. Burnett's "Louisiana" here concluded; by Mr. Cable's "Grandissimes," whose story of Bras-Coupe in the April installment has been compared in dramatic strength to Victor Hugo and Manzoni; and by Mrs. Rebecca

Harding Davis's short story "Walhalla." The poetry is by Clarence Cook, Celia Thaxter and Juliet C. Marsh. The departments include papers by Dr. Holland on "Pettiness in Art," "International Copyright," and "Common Sense and Rum;" "Hints for the Yosemite Trip," with estimates of cost of a ten days trip; "Nerves in the Household," The Book Reviews, some "Bric-a-Brac," and and a very fresh department of "World's Work," including "Western River Improvement," "Centrifugal Milk-tester," "Transposing Piano," etc,. etc.

BRIC-A-BRAC.

AN OBEDIENT GIRL.

"Come out into the garden, love,
Where perfume fills the air;
I'll gather the fragrant blossoms, love,
To deck your sunny hair."
"Oh no, dear George," she sadly sighed,
"I can't enjoy such blisses;
Ma says I must stay in the house
And wash the supper dishes."

Two ragged urchins stood one day
Beside the great church door,
And watched the folks in rich array
From out the temple pour.

"My eyes! but ain't they tony, though!
And don't they sport the dress!
What be they, Joe?" "Oh, I dunno—
They're Christain folks, I guess."

"They be! Then, if we had the cash,
And nothing else to do,
And washed, and dressed, and cut a dash—
Should we be Christians, too?

[*Boston Transcript.*

THE NEW TENOR.

He drew in his breath with a gasping sob,
With a quavering voice he sang;
But his voice leaked out and could not drown
The accompanyist's clamorous bang.
He lost his pitch on a middle A;
He faltered on lower D;
And foundered at length, like a battered wreck
Adrift on the wild high C.

REASONS.

She never will crown with her earnest love
The life of some honest, loving man,
For she kindled the fire in the kitchen stove,
With the lightsome tilt of the kerosene can.

And he—his work had been laid away
Almost before it was well begun;
For he didn't know, they heard him say,
There was any load in the empty gun.

[*Burlington Hawkeye.*

"Yes, my love, it was fresh and glowing,
Blooming and beautiful—yesterday!
Now its odor is sickly, its petals are going,
Its beauty is vanished, throw it away!
Pray don't thrust it under my nose!
Who can endure a yesterday's rose?"

A RHYME OF THE TIME.

Miss Pallas Eudora von Blurky,
She didn't know chicken from turkey.
High Spanish and Greek she could fluently speak,
But her knowledge of poultry was murky.

She could tell the great uncle of Moses,
And the dates of the War of the Roses,
And the reasons of things,—why the Indians wore rings
In their red, aboriginal noses!

Why Shakspeare was wrong in his grammar,
And the meaning of Emerson's "Brahma;"
And she went chipping rocks, with a black little box
And a small geological hammer.

She had views upon co-education,
And the principal needs of the nation;
And her glasses were blue, and the number she knew
Of the stars in each high constellation.

And she wrote in a handwriting clerky,
And she talked with an emphasis jerky,
And she painted on tiles in the sweetest of styles;
But she didn't know chicken from turkey!

Last year, young D——waited upon the daughter of a rich pharmacist, hoping to marry her. At that time, whenever he spoke of his expected father in law, he always said, "That great savant," "The famous chemist," etc. Much to his disgust, young D——was refused by the pharmacist's daughter. And now, whenever any one speaks to him of his unattained father in-law, he says disdainfully, "Ah, yes, that old herb-gatherer."

A TOUGH QUESTION.

Children are often puzzled by questions which are not understood by their elders. During the late Franco Prussian war a Sunday-School scholar read about the prayers with which the Germans and French were petitioning Heaven for success to their arms. "Mother, asked a little girl of her parent, "I don't see what the Lord can do under the circumstances, do you? He can't give the victory to both of them, and it seems to me like a terrible dilemma to be placed in." Her mother, who was not entirely satisfied with the role which Great Britain played in the affair, remarked, "Well, my dear child, perhaps he will do as the English do, and remain neutral."

PATRICK'S EXPERIENCE WITH THE ELEVATOR.

Sez I, "Iz Misther Shmith in, surr?" Sez the man wid the soger cap, "Will yez stip in?" So I stips intil the closet, and all of a suddint he pulls at a rope, and it's trooth I'z teelin' yez, the walls of the building begun runnin' down cellar as though the divil was arther them. "Houly murther!" sez I, "what 'll become of Bridget and the childer which was litt below there?" Sez the soger cap man, "Be aisy, surr; they 'll be all right when yez come down." "Come down, is it?" sez I; "and is it no closet at all, but a haythenish balloon that yez got me in?" And with that the walls stopped stock still, and he opened the door, and there I was wid the roof jist over me head! And that was phat saved me from goin' up till the hivins entairly.—*Boston Transcript.*

For Women.

CONDUCTED BY MISS RAY CLARK.

SEED CASKETS.

BY ADELAIDE STOUT.

Here are rosewood caskets shut
Down with secret spring;
In them little pearls are hid,
Strung on finest string.

Here's a coffer filled with coin
Round and polished fair,
Yellow as our finest gold;
Minted with more care.

Yet they wear no stain, as oft
Doth our current gold:
Palms ne'er held them as a bribe
In their secret hold.

Here are jewels cut in jet,
Polished, and then hid
In the till that lies beneath
This quaint, carven lid.

The rich brown of this small boll
Cut in outlines sharp,
Seems as carved with vine and leaf,
In this pericarp.

There are white pearls that divers bring
From the cruel sea.
Spring the lock, and see how clear
The hidden pearls may be.

Like a softly tinted shell,
On finest cameo
Is this capsule, traced in lines
Softer far I trow,

Than are those the artist cuts
In the shell we prize,
Yet these gems are scarcely seen
By our careless eyes.

RECREATION FOR WOMEN.

BY MRS. M. L. SAYERS.

Rockeries.

Rockeries too frequently show the studied symetry characterizing art. A perfect hemisphere or pyramid, resembling a farmer's rock-pile is usually heaped up with a handful of earth high and dry on top, in which a fern transplanted from the mossy banks of a stream is expected to become a thing of beauty—a joy forever.

Rockeries belong to landscape gardening, and an imitation of nature only is appropriate in their construction. For a farm-yard where fowls run at large, let this be a permanent arrangement, planting perennials which will each year increase, and unrestrained, assume more natural positions among the rocks. Let the situation be upon the north side of any ivy-covered wall. This makes a fine back-ground.

Set a cross (or if desiring to adhere more closely to the natural, a cedar trunk lopped of its triennial branches) firmly in the ground, roll up around this huge stones (gray limestones taking on angular, massive shapes are the most striking), leaving a space which is wider around the cross, gradually terminating in an irregular point towards the front.

During yard-cleaning, throw into this space the trash; old shoes, bones, leaves and dead grass; fill up with ashes, hen-house sweepings and sandy loam. At the foot of the cross plant a woodbine or other hardy vine; behind it, tall-growing, perennial larkspur; in front, a fern; front-left, columbine; right, perennial phlox, chrysanthemum, lychnis, cowslip, daisies and pansies, the low-growing filling the point.

The evergreen creeping myrtle is pretty, but soon encroaches upon other less vigorous plants. The dielytra spectabilis, or bleeding-heart, is appropriate for this style of rockery, both on account of its habit and appearance. Here whole chains of bleeding-hearts lift themselves from this "rifted rock of ages" to the cross crowned with life eternal. Here perpetual verdure crowns this otherwise unsightly heap, it creeps through, fills, the crevices, and grows up outside till nothing is seen save a few jagged points of gray-stone, which only tend to the picturesque.

For a summer or temporary rockery of like appearance, a root of Madeira vine will soon cover the frame with its thick, succulent leaves, sending graceful feelers out into the air to fill it with delicate perfume. Nasturtion will creep up and thrust its orange trumpets through this overlapping foliage, like so many gold-crested chicks peeping through the maternal feathers.

Asters and candy-tuft, so difficult to be grown in open borders on account of insects, flourish here unharmed beneath the shadow of the cross, while snap-dragon and ten-weeks' stock are nowhere else so much at home.

Some readers will say this article cannot benefit me, as I have no north corner to be ornamented. For such as are denied this more natural situation comes the next and last resort; while stones are not usually associated with tropical growth, they may be used as a nucleus for curious shells, fossils and other such collections. Fill the space with sand; at the foot of the cross plant running cypress or yellow jessamine; in the rear, a stately canna or ricinus; in front, a banana, palm, or yucca filamentosa, on the right, cockscomb; on the left, cactus, portulaca and tradescantia.

UPHOLSTERING.

PANSY RAY.

I do not mean to treat of the word in the full acceptation of the term, but only to give a few "hints" in upholstering as practiced by a neophyte, and that neophyte a woman.

The "parlor set" consisted of a gentleman's and lady's chair, four smaller ones and sofa, in the unique Eastlake style, neatly upholstered with brown repp. Not a single rocking-chair among them. To be sure there was a cane-seated one, which had formerly occupied a place in the room very much after the same pattern as the set, but then it hadn't exactly the "air," so the only alternative was to get a new one or upholster the old one. The latter plan was chosen and carried out in this way.

Two stripes were worked on Penelope canvas, one for the seat and the other for the oval cane-work piece in the back. The pattern selected was oak leaves and a branch of coral, the leaves being worked in shaded green zephyrs and the coral in red, the ground work was then filled out with zephyr a little deeper shade than ecru.

Repp was procured for seventy-five cents which matched the set in color, and almost in quality; the gimp and gimp tacks the upholsterer was kind enough to throw in.

The repp was cut the required size, the stripes were basted on to it with gimp on each side, and then stitched with the machine. The bottom of the chair was cushioned with nineteen or twenty layers of sheet-wadding, held firm by being sewed through the cane, and the cane also served for springs.

The top was then put on and neatly tacked around the edge with tacks and gimp.

The back was treated in the same manner, except there was only half the amount of wadding used. A piece of brown cloth was tacked on the back part of the chair. And behold the result! A neat, almost elegant, chair, that any woman would be proud to point to as a specimen of her achievements in the art of upholstering.

Of course, you are to regulate your materials according to your purse, for instance, one of cheap cretonne or woven stripes can be procured for less than it would cost you to work one, and be almost as handsome.

Or if your pocket-book is quite plethoric you can procure more elegant stripes and material to match. Some of the latter class have been known to buy split-bottomed rockers and upholster them in a very elegant style, finishing them around the bottom with heavy fringe, costing from three to four dollars a yard.

Their chairs cost them from eight to nine dollars, but they were equally as handsome as those sold for eighteen or nineteen dollars.

If persons would forage among the rubbish and bring to light the chairs in which, when children, they were rocked to sleep to the accompaniment of some wonderful story, they would find them much resembling the chair of the period, and by using a little ingenuity, with perhaps, a piece nailed on here and there, to serve as strengthening plasters, upholster them in such a manner that they themselves would be surprised, after the rejuvenating process, at their youthful appearance.

But I will give you another leaf from the upholstery experience of "the novice." There was a square of repp left over from the chair, and this she utilized in upholstering an ottoman.

The ottoman frame was somewhat hexagonal in form, but the corners were not cut off enough to make it entirely so. A cushion was made of a number of layers of an old quilt with several layers of wadding on top, which were all sewed firmly together. This made a soft cushion, and one that would not flatten.

But an unforseen obstacle arose; the piece of repp was too small when the cushion was made—but trust a woman not to be outwitted—so instead of stitching the cretonne stripe on after the manner of the chair, the repp was cut diagonally across the square and the stripe set in, but as it was not as heavy as the rep it was lined with burlap.

The gimp having all been used on "that chair," another means was devised for fastening the strip on, the rep was laid over on each side of the cretonne, after the manner known in dress-making as piping, and then stitched. The ground work of the stripe was black, and black and brown never look well when in too close proximity.

One must, however, get used to obstacles and learn to surmount them. This evil was remedied by a row of herring-bone stitches worked in gold silk floss over the machine stitching between the stripe and the rep piping. This finish was equally as pretty as the gimp. The top being now completed, it was tacked on the frame, after which brown fringe four inches deep was tacked around the edge, the heading of the fringe having first had the gold floss worked on in larger herring-bone stitch. You would scarcely imagine what a pretty ottoman it is. And such a marvel of cheapness too.

GRANDMOTHER'S OPINION ABOUT SEWING MACHINES.

"Do I think sewing machines are a great invention?"

"Yes, one way you look at it, they are great institutions, but I do not think they have done any good in the world. I really believe womankind would have been happier, if the inventor had never been born.

They might have done good but like a great many other things, they have been perverted, and instead of a blessing, are a curse.

Now, suppose, a case for example, and there are thousands of just such cases, all over the country. Mrs. Gilson has half a dozen little children, her husband is not fourhanded, it is all they can do to make both ends meet; they cannot afford to hire sewing done, they are not able to keep a hired girl and the poor woman has her hands full, of course.

It is no light job, to cook victuals enough, to fill all those hungry mouths, not to speak of washing, ironing and general house work; then, there is the mending and making to keep them comfortably clad; every spare moment is employed in sewing.

The little ones are all dressed neat and plain. She works all the time to keep things up, but she does it somehow; where there is a will there is a way. After a while, she gets a sewing machine; and it is a good help.

She turns off the garments quickly. It is splendid, to get on with one's sewing so fast. So far it is well; it is really a help to her. But she is not content with plain dresses for the little girls, everything must be trimmed. It is so easy to make nice trimmings with a machine, and children look so pretty with ruffles and puffings, flounces and tucks. If it does take more cloth and time, and thread. She can do it herself—and so she stitches without any rest, every spare moment is spent at the machine.

The little girls are set about the housework, so mother can get more time to make their pretty dresses. By and by, she gets a back-ache, a side-ache, and her head gets confused with the humdrum click of the machine and the poor woman breaks down, her nerves are all unstrung and after a while the machine stops, for Mrs. Gilson is sick; worn out with hard work.

Hired help has to be employed.

Doctor's bills come in, and the children are neglected, and everything goes to ruin generally. You all know how it is—that sewing machine was the cause of the mischief. Had the poor woman just done her necessary sewing, it would have been well enough to have had a machine; but you see that could not content her; and half of the extravagance in dress and fashion is the result of the advent of sewing machines.

Girls are not instructed in the use of the needle as they used to be; good hand sewing is gone by, everything is stitched by machine; and hems stitched do not look neat, after a little while the dirt and dust will gather, and a gray streak borders every hem. I cannot say, that I admire undergarments trimmed with mourning, they do not look tidy; give me a neat hem, sewed by hand, that gives no chance for a gathering of dirt. The machine work rips, and ten to one if it is noticed till it gets to be a great rent.

I suppose it is because I am old-fashioned, that I like the old style of work the best.

No, I do not think the world is any better off, for the invention of sewing machines.

Many a nice healthy girl, has stitched herself to death, many mothers have gone to the grave, just in consequence of overworking themselves on a machine.

It is not a good exercise, it is hard: just as bad as spinning linen used to be for girls; a little of it, wont hurt any one, but to follow it up is death in the end. S. H. R.

LAMBREQUINS AGAIN AND WINDOW SHADES.

MRS. E. K. B.

"Effie" asks for directions for making pretty and inexpensive lambrequins. We have just finished some which I think are as pretty as any that I have seen, and although the work of making them is considerable, they cost but little money.

The foundation is of slate colored cambric which is faced all around with a strip three inches wide of Turkey red calico. The lower edge, instead of being cut in the deep points which, from being seen in too many windows are becoming almost monotonous, is curved upward in one deep concave scollop. The depth of the lambrequin on the sides is twenty-eight inches and in the middle, eighteen inches. The lower edge is also decorated with a pointed netting four inches wide, made of scarlet yarn and hanging from each point is a little scarlet ball.

Netting is an old fashioned trimming that adorned the bed-curtains and stand-covers of our grandmothers, and it is such pleasant, pretty work and can be made useful in so many different ways that I am very glad to see that it is being revived.

The lambrequin should stand out slightly from the window and ours is tacked to a curved strip of board that is fastened horizontally to the top of the window casing.

Where there are blinds to the windows these lambrequins can be used without other curtains, or there may be full flowing curtains of the same material.

WINDOW SHADES.

I have in mind some new window shades for a bedroom, that are to be made of nice, smooth, unbleached muslin with a border of red set two or three inches from the edge, and on each edge of the red a row of feather-stitching done with white knitting cotton. If there is time, there will also be a monogram worked with scarlet in the center and surrounded by an oval border cut from the red calico.

They will do very well without the centerpiece, although one need not hesitate to spend a little extra work on shades like these, for they will bear washing. I shall fasten them to the windows with the fixtures of some worn-out oil shades.

Of course, in making either lambrequins or curtains, one must have some regard for the prevailing colors in the carpet and furniture, and use colors that will harmonize.

A PLEA FOR "GOSSIP."

E. L. T.

I do not wish to say anything in favor of slanderous back-biting; or for the encouragements of the—— "They Say Club," those social vampires that flourish in every community. I wish to speak in favor of wholesome, though much abused gossip; little local happenings—which does no one harm, and yet is often abused as frivolous and unmeaning.

Granted, that the farmer's wife would be better engaged if she talked of every-day science and household hygiene, of literature, art, "Shakespeare and the musical glasses," but what time has the busy housewife to learn of such things? It may be said that she could make time for it, if she determined to do so; but how can she escape from her multifarious duties—from the bondage of the household?

Held down by the trammels of unavoidable, un-

ceasing work, what can she talk about to a stray visitor other than such trifles as Mrs. A's trouble with her servant or Mrs. B's sick chickens?

In a meeting of women who talk about their household affairs, there is far more real practical every-day wisdom discussed than in a meeting of literary young misses who give their opinion as to the relative merits of various authors.

I think such a body as the Kitchen Club Mrs. Annie Jack tells us of, cannot be too highly commended. I have no doubt all the members feel their wits greatly brightened by the meeting, if they do discuss no higher subject than cookies. Still I wish, whether they gossip or not, that housekeepers would give more attention to household science, so that in their cooking, their house and its appointments, they would violate no hygienic canons.

THE EMPRESS AUGUSTA, of Germany, had in 1870 as her reader a French gentleman named Gerard. One day he was reading to her a book on the war of 1870-71 and came to a passage in which the French were treated with a good deal of severity, "Skip that, if you please," said the imperial lady, with equal gracefulness and quickness.

MRS. JULIA ATZROTH, of Florida, has raised the first coffee grown in the open air in this country, so far as known.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

CONCERNING HOUSEHOLD MATTERS.

MARY WAGER FISHER.

To the RURAL readers in search of *starch* for "mourning" calicoes, or plain dark linens or cambrics of any sort, let me recommend the use of gum-arabic as being the most satisfactory of all starch for such purposes. Dissolve the gum in warm water—say at first a teaspoonful in a pint of water or less. Of course, the amount used must be in proportion to the required stiffness and the amount of fabric to be starched. Apply the solution to the surface of the fabric with a small, clean cloth, making only a small portion of the frock at a time moist with it. A little practice will make one an adept in the use and application of it. If you wish the goods to have a gloss, iron on the right side; a soft, new appearance is produced, if ironed on the wrong side. Forty or fifty cents' worth of gum-arabic will serve for such starching, and keep the mucilage bottle filled for a long, long time—two or three years in a small family. Old straw hats may be stiffened anew with it, and made quite presentable if carefully pressed. At all events, if you have a very dark, or black cotton or linen frock to "do up," invest five or ten cents in gum-arabic and try it. I am sure that you will never ask for a more satisfactory method.

Cleaning Stoves of Ashes.

To clean a stove hearth of ashes after coal-cinders and ashes have been removed from the pan, do not use a brush or broom, as that makes a dust. But take a woolen cloth, or even a "worn-out" cotton stocking, or piece of woven underwear stuff, and wipe off the hearth.

Cleaning Paint.

When you "clean house" this spring, soften the water with soda for cleaning painted wood—use no soap. Use a flannel or cotton-flannel cloth. Begin with closets, pantries and "crannies"—which should be made clean and "put to rights" first. This is really the most fatiguing part of house cleaning for the mistress, as much of it must be done by herself, and so it is better to attend to it before one's strength is half used up.

Good Knitting Yarn.

I would be glad to be informed where *good* stocking yarn can be procured. I pay from 12 to 13 cents per ounce for red stocking yarn in the city (Philadelphia), and the stockings will wear from one to two weeks on the feet of a certain three-year-old boy, when holes in the heels and knees appear. It is very discouraging to knit stockings under such circumstances. I have experimented with different brands of domestic yarn; but with about the same result. I know that old-fashioned home-spun yarn wears a great deal better; but where can it be had? I think there are many persons who are old-fashioned enough to knit—or new-fashioned—who would be equally glad to know where good, strong, soft yarn can be had.

PEN-THOUGHTS FROM EVERY-DAY HOUSE.

MRS. ANNIE L. JACK.

How balmy the air! I always think in spring-time of those lines of Whittier's:

"And all the windows of my soul
I open to the sun."

It seems as if the windows of the soul and of the house are wonderfully renovated by the spring air and sunshine. The children revel in them. Their brown cheeks have taken on a tan that only next winter's frost will remove; but better so—better the air and sunshine, and the free play of healthy lungs "open to the sun—" than pale cheeks, and a tendency to disease. No part of the house needs to be earlier aired and sunned than the cellar, and I am always glad when the windows and doors can be opened and a thorough ventilation takes place before cleaning. Then white smoking hot lime, with a good handful of salt in each pailful to destroy insects, a full brush and strong arm, and in half a day the cellar will smell sweet and wholesome. We mix a little cement with the refuse whitewash, and a little sand; these make a mixture that will fill up all holes where troublesome mice might creep through. A friend of mine, after cleaning all the cellars, burns a little sulphur in them, the fumes of which purify from mold, and destroy insects or fungoid growth. More important than the house-cleaning of parlor and spare bed-room is that of these the "lowest rooms."

BUTTER COLOR.

I HAVE just noticed in a late RURAL directions for coloring butter with the juice of carrots. We have tested the different methods of coloring butter quite thoroughly and some time ago discarded the use of carrots for this purpose; as we found that, aside from the trouble of preparing them, there was another objection to their use—when the butter is kept for some time (even for a few weeks), it is apt to acquire a disagreeable flavor from the decay of the vegetable matter in the coloring. Were it not for these objections I would prefer it to the prepared butter color which we buy; for if one uses a little too much carrot juice the butter will still be of a golden tint, while a very little too much of the other gives a disagreeble reddish tinge. Therefore great care is neccessary in using it—better use too little than too much at first, while learning how to proportion it. I never have found that the prepared color injures the keeping qualities of butter in the slightest degree, and the expense of using it is a mere nothing as a twenty-five cent bottle will color more than three hundred pounds. E. K. B.

DOMESTIC RECIPES.

Biscuit Making.

IF, when making biscuit, the saleratus is sifted with the flour instead of dissolving it in water, the biscuit will be lighter and better. I use a moderately heaped teaspoonful of saleratus to two cups of sour milk or buttermilk. I prefer buttermilk, but the buscuit must be mixed as soft as possible.

Brown Bread.

Three and a half cups of Graham flour; two cups of Indian meal; two-thirds of a cup of sirup; one pint of milk; one pint of water, or if you have not plenty of milk use all water; one teaspoonful of saleratus and one teaspoonful of salt. Steam four hours. It is excellent. I always make it to eat with baked beans. My husband thinks it is better than the famous Boston brown bread. MRS. P. C. C.

Stocking Supporters.

I think I have an improvement upon children's stocking supporters. Make a skeleton waist of rubber webbing and sew on to a stout band, which may be used for the drawers also. Then sew on V-shaped straps on both sides with buttons on, with which to fasten the stocking elastic. I knit seaming onto the wrists and bottoms of my children's flannel drawers, which I think much nicer than buttons.

To Use Stale Bread.

Soak the bread in hot water until soft; when cold add two eggs, half a cup of sweet cream, one teaspoonful of soda, a little salt and flour to make a stiff batter like fritters. Fry in hot lard or boil in water. To be eaten with sirup or whatever liked.

Graham Gems.

One pint of buttermilk, one teaspoonful of soda, a little salt if butter is not used, one tablespoonful of shortening, one tablespoonful of sugar, Graham to make a batter like Johnny-cake. MRS. J. G. BELL.

Silver Cake.

Two cups of granulated sugar; one small cup of butter; two even cupsful of sifted flour; whites of 12 eggs; juice of one lemon. Cream the butter, then add the sugar, stirring until very light. Beat the eggs to a *stiff* froth. Add the flour to the butter and sugar then the whites of eggs and stir all to even lightness. Bake in small square tins. Rose water may be used for flavoring the icing.

Ginger Snaps.

One even cup of butter; one cup of brown sugar; two cups or molasses; a teaspoonful of salt and two of soda. Any spice liked and flour to roll out. Put *all* but flour into a clean pan and boil five minutes. Then remove from fire and at once begin to add flour. Work as rapidly as possible and bake in a quick oven. MARY B.

NOTE.—We wish to thank Col. F. D. Curtis for a side of bacon which the family pronounce of the very best quality. E. M.

Stock and Poultry.

IMPORTED CLYDESDALES
ALSO,
HAMBLETONIANS,
and other desirable strains of **Trotting Stock**, for sale, **cheap**, and on **easy terms**. All stock guaranteed as good as represented. Catalogues sent free. Correspondence solicited. Address
POWELL BROS.,
Springboro, Crawford Co., Pa.

THORLEY FOOD,
For Stock of all kinds, keeps Horses in perfect health. Fattens Stock quicker than anything else, increases quantity of milk in Cows, and COSTS NOTHING. Has been before the public for over 25 years, and has never failed to give satisfaction. *For sale everywhere.* Circulars, with convincing testimonials, free.
THORLEY FOOD CO.,
18 and 20 Franklin St., CHICAGO, ILL.

HIGH CLASS POULTRY, Grape Vines, Small Fruits, finer than ever. Send for circular. GEO. S. JOSSELYN, Fredonia, N. Y.

PLYMOUTH ROCK EGGS for sale from pure bred fowls, $1.00 for 13, warranted fresh and true to name. L. H. SMITH, Scipio, N. Y.

Real Estate.

LANDS AND HOMES
IN SOUTHWEST MISSOURI.
1,000,000 acres well-watered Timber and Prairie Lands along the line of the St. Louis and San Francisco R. R. for sale at from $2.50 to $8.00 per acre *on seven years' time.* Excellent for Stock, Fruit, and Farming. The best Tobacco Region in the West. Short winters, convenient markets, superior schools, low taxes, healthful climate, good society. Free transportation from St. Louis to purchasers of land. *Send for maps and circulars.*
W. H. COFFIN, Land Commissioner.
Temple Building, St. Louis, Mo.

Miscellaneous.

SALT is NECESSARY for LAND
Fruit Trees, &c. LUMP SALT is excellent for horses, sheep, &c. All kinds of salt in full supply; also, Ferris' **Land Invigorator** and **Crop Protector**—death to **Hessian Fly** and other pests. Use it and reap a golden harvest.

News of the Week.

MISCELLANEOUS.

Monday, April 26, 1880.

THE bill in regard to the world's fair to be opened in N. Y. City in 1883, on the hundreth anniversary of the peace between the thirteen States and England, has passed both houses and received the President's signature. Thus the first step in this great enterprize has been taken and others will rapidly follow .....A Democratic Convention was held at Syracuse, N. Y., on the twentieth inst. The Tilden men were in the majority, and although the delegates to the National Convention to be held in Cincinnati were not instructed to vote for Tilden, there can be but little doubt that they will cast their votes for him.....President Hayes' private secretary, Mr. W. K. Rogers, it is rumored, is likely to be appointed Governor of Dakota.....The U. S. ship Constellation arrived at Queenstown on the 20th with succor for the famishing Irish people .....The House committee on war claims has reported adversely on 110 claims, involving $5,000,000.....It is stated that W. H. Vanderbilt has 54 million dollars' worth of four per cent. bonds registered in his name.....Fifty-two newspapers and magazines of this country are edited by colored men.....The chief of the bureau of statistics reports that the exportation of petroleum and its products during Feb. was 24,962,662 gallons, worth $2,302,755..... The women are steadily gaining recognition at the polls. The first woman's vote in Illinois, on the liquor question was given at Keithsburg a short time ago. It was a question of license or no license, the women, 165 in number, voting solidly for the latter. On the morning of the election a prayer-meeting of two hours' duration kept siege at the very gates of heaven for success, and it was granted....The mystery shrouding the assault on Mr. Whittaker, the colored cadet at West Point, an affair which we mentioned in last week's news, has not yet been cleared up. Last Saturday closed the 15th day of the investigations, and, with the evidence apparently nearly exhausted, the matter is still as bewildering a muddle as at the outset; nothing has been brought to light that will give a clue to the perpetrators....A tragedy took place in San Francisco on the evening of the 25d inst., which, by reason of the notoriety of the parties involved, has created great excitement in that city. Charles De Young, the editor and proprietor of the San Francisco Chronicle, was shot and instantly killed by I. M. Kalloch, a son of the mayor of the city. The trouble is an old one. Eight years ago, shortly after the arrival of Kalloch in San Francisco, the Chronicle contained an exposure of his alleged scandalous behavior in Boston, and when he entered politics last year this was again revived. Kalloch retaliated, reflecting dishonor on De Young's aged mother. For this he was shot by De Young last August, but recovered from the wounds; and now Kalloch's son, who is also a Baptist minister, enters the Chronicle office and assassinates his father's assailant. He was arrested

An exceedingly destructive tornado swept over a large area of the Western country on the evening of April the 18th. Its force was unparalleled. It leveled everything in its path, whole towns were demolished and almost obliterated from the earth, and hundreds of persons were killed and wounded. Ruin, desolation and death are the land-marks of its terrible track. Reports state that the violence of the wind was so great that trees three feet in diameter were for a space of several hundred feet, entirely lifted out of the ground, limbs twisted off and the bark in many instances peeled off as if struck by lightning. Telegraph poles were twisted off at the ground, the wires carried hundreds of rods and tied and knotted among the limbs as if they were made of cotton yarn. Cattle, hogs, sheep horses and poultry were whirled into the air and carried great distances. Eye witnesses describe the approaching storm as a frightful-looking black cloud, funnel-shaped and moving in the manner of a screw-propeller. The greatest destruction appears to have occurred in Missouri and particularly in the southwestern counties of the State. Here the little thriving town of Marshfield, with 2,500 inhabitants, was blown down and the ruins taking fire the town was in the course of a few hours almost obliterated. Whole families were killed in their homes. The death list reports 100 persons killed in this town alone. The storm came from the west and moved eastward. It seems to have spent its greatest fury between the 37th and 38th degrees of parallel, but its track was irregular, and destructive gales are reported also from Iowa, Illinois, Wisconsin, Michigan, Indiana, Ohio and southern Canada. It is impossible to give anything like an approximate estimate of the damage incurred. Later reports show that the destruction of life and property is much greater than was at first supposed.

AGRICULTURAL NEWS.

On Thursday, Saturday and yesterday a terrible storm raged along the line of the Central Pacific railroad in Cal., and throughout the greater part of the State. For the first two days a heavy unintermittent rainfall prevailed in the valleys, the rivers and streams rose; and then there was eminent danger of the flooding of all the low lands and the destruction of homesteads, villages and even of Marysville and Sacramento. Fortunately the rain changed to a snow storm on the Sierras and the danger has been averted. 'Twas the heaviest storm that ever swept over the Central Pacific Railroad region. All now promises settled fair weather.....A dispatch from Melbourne, dated March 23, says: "Fine rains have fallen in Victoria. The wool prospects are good and the labor market is improving."..... A cyclone struck the north line of Adams county, Ill., Friday evening doing great damage. Twenty houses and barns are known to be demolished, and several persons killed and wounded..... A break in the Erie Canal, near Schuyler, has prevented navigation for some days; but the work of repair is being vigorously prosecuted and navigation will be resumed to-morrow, April 27.

New Publications

are furnished by the World's Dispensary Medical Association, Buffalo, N. Y., and Great Russell Street Buildings, London, England, on terms to suit the times. A new edition of the People's Common Sense Medical Adviser, about 1,000 pages, nearly 300 illustrations, by R. V. Pierce, M. D., post-paid, $1.50. Invalids' Guide-Book post-paid, 10 cents; Motion as a remedial agent, illustrating movement cure for paralysis, diseases of females, stiffened joints, club feet, spinal curvature and kindred affections, 10 cents; Diseases of Generative Organs, 10 cents; Catarrh, its rational treatment and positive cure, sent on receipt of one postage stamp. Address as above.

NEAR GENEVA, N. Y.

ALBANY AGRICULTURAL WORKS.

DEAR SIR:—You will probably recollect that I got a Corn Drill from you about 30 years ago. Now the Wood Cylinder that distributes the corn is worn so it does not hold the screws. Will you please send me one with screws in, by mail or express, and I will remit you the price. I have drilled my corn with it ever since I got it, and am fully satisfied it saves a good deal of labor, and I can raise a considerable more corn to the acre than by the old fashioned method. Please let me hear from you. I am now an old man. I finished my 85th year yesterday. Truly yours, JOHN JOHNSTON.

A GREAT many persons become insane from sleepless nights that Hop Bitters would have prevented.

ASTHMA.—Thousands of the worst cases of Asthma have been relieved by using JONAS WHITCOMB'S REMEDY. In no case of purely asthmatic character has it failed to give relief.

What Ails You?

Is it a disordered liver giving you a yellow skin or costive bowels; or do your kidneys refuse to perform their functions? If so, take a few doses of Kidney-Wort and nature will restore each organ ready for duty.

FOR THROAT DISEASES AND COUGHS.—"*Brown's Bronchial Troches*," like all other *really good* things, are frequently imitated, and purchasers should be careful to obtain the genuine article prepared by John I. Brown & Sons.

J. & J. DOBSON'S CARPETS.—At Nos. 40 and 42 West 14th Street, New York, Messrs. J. & J. Dobson, proprietors of the Falls of Schuylkill Carpet Mills, have a large and elegant store, filled with new goods in all the popular grades of carpets from their own factories. Having large capital and unsurpassed facilities for the production of fine goods, at the lowest cost, they offer to those in want of floor coverings an immense assortment at manufacturer's prices; thus enabling purchasers to save the profits usually made by the agent of the factory and the jobber. Using great care in the selection of the material, and watching closely every process in production, it is claimed for their goods that they combine the advantages of artistic designs, rich and harmonious coloring, and thorough wear in actual service. Besides the carpets of their own make, the firm imports large lines of Turkish and East Indian Carpets, Rugs and Mats, which they offer at very attractive rates.

The Markets.

SPECIALS FROM ALL CENTERS.

Until Saturday, April 24.

Baltimore.—WHEAT—Southern red at $1.25@1.27; do. amber at $1.30@1.33; No. 2 Western winter red, spot and April, $1.28@1.28½; May at $1.25½@1.26½; June at $1.24@1.24½; August, $1.06@1.10. EGGS—Eastern at 15 cents, Northern 1½, 2@13c, Western 11½@12c ₩ doz. BEANS—Northern hand-picked Pea at $1 65@$1.75 ₩ bushel; do. do. Western, at $1.65@$1.70; do. common $1.60@$1 65; medium choice $1.40@$1.45; common to good $1.25@$1.30; Yellow Eyes $2.05@$2 20; Red Kidneys at $1.40@$1.50. Canada Peas 80c@$1.05 ₩ bushel for common to choice, Green Peas $1.50@$1.85. POTATOES quiet; Houlton and Maine Central Rose 50@56c ₩ bushel: Houlton Jackson Whites at 38@40c, Maine Central Jackson at 38@40, Vermont Rose at 45@50c, do. Jackson at 35@38, Peerless at 43@47, and Prolifics at 50@55c ₩ bushel. ONIONS $1.00@4.50 ₩ barrel, and Bermudas $2.75@$3 ₩ crate. APPLES at $2.50@$4.00 ₩ barrel, according to quality. CRANBERRIES at $9@$12 ₩ barrel. SEEDS—In Calcutta Linseed nothing doing, and prices nominal. We quote Clover Seed steady at 6½@7¼c ₩ lb for Western and New York; Timothy at $2.60@$2.75 ₩ bushel; Red Top at $2.50@$2.70 ₩ bag; Canary Seed at $2.46@$2.85, and American Linseed $1.50@$1.55 ₩ bushel. TOBACCO—Sales at steady prices. Crop of 1878—Conn. and Mass. wrappers 13@15c ₩ lb for common, 16@18c for medium, 20@27½c for fine, 30@40c for selection, 10@14c for seconds, and 6@7½c for fillers; Penn. assorted lots 11@12c for common, 12½@15c for fair, and 16@20c for fine; Penn. wrappers at 16@35c, and Penn. fillers at 9½@10½c; New York assorted lots—Common at 10@11c, and good at 12½@15c; Ohio assorted lots 8@14c. Ohio wrappers at 15@15c; and Wisconsin assorted lots 8@12c.

Chicago.—WHEAT steady with a fair demand; No. 2 Chicago spring at $1.12. cash and April; at $1.13 bid May; at $1.08¾ June; $1.03 July; No. 3 do. at 99c; rejected at 80c. CORN dull at 36½@36¾c. Oats quiet and weak at 29½c. RYE firmer at 72c. PORK dull but closed firm at $9.75@9.80. LARD steady, with a fair demand, at 6.90c. BULK MEATS fairly active at 6.20c.; short clear at 6.45c. BUTTER—Choice creamery, 24@26c.; fine to fancy dairy, nearly equal to creamery, 20@23; good to choice dairy, 17@18c.; medium to fair do., 15@16c.; common, 13@14c; good to choice roll, 15@17c.; medium to fair do., 12@14c.; common, 10@11c; grease butter, 6@8c. CHEESE—Choice to fine old cheddar creams at 14½@15c. ₩ lb; fair to good new do., skimmed, at 10½@11c.; flat skimmed at at 9½@10c., and common and poor stock, 6@7½c. EGGS—Prices steady at 9c. ₩ doz. for fresh, in cases, and 8@c. for loose lots, the demand being fairly active. HIDES AND PELTS—Green salted light hides, 2½c. ₩ lb: do. heavy cows, av. 60 lbs. and over, 9c; No. 2, or grubby and cut, all weights, 8c.; green salted bull, 6½@6¾c.; do. calf, 15@15½c.; dry salted hides, 14@15c.; dry flint, 18c.; dry calf, 18@19c.; deacons, 55c. SHEEP PELTS are salable at 50@55c. ₩ lb for the estimated amount of wool on each pelt SEEDS—The market was again unsettled, clover ruling a shade stronger, while timothy is dull and easy. Good to prime medium clover at $4@4.15 ₩ bushel; mammoth do. at $4 15@4.25; fair to prime timothy at $2.20@2.30; choice do. at $2 35@2.40; good crushing flax at $1.40, and common to prime Hungarian and millet at 60@80c. WOOL—A weak feeling has prevailed for some time past, and although former figures are named, consignments would not probably sell for the extreme outside figures given. Asking rates from store for eastern Iowa, Wisconsin, and Illinois wool range as follows: Tub-washed bright 58@60c, ₩ lb; do dingy and coarse 50@55c.; fleece-washed medium 55@58c.; do. fine 48@53c.; do. coarse 48@53c.; unwashed medium 40@42c.; do. coarse 33@35c.; do. fine bright 30@34c.; do. heavy 25@30c.; buck's fleece 20@22c. Consignments from western Iowa, Nebraska and Kansas sell at about 2c. ₩ lb less than this range, and burry and poor-conditioned lots at 3@5c. less. Colorado wool (unassorted) is quoted at 30@34c ₩ lb for medium to fine; at 27@30c for coarse to medium; at 25@28c for black, and at 22@25c for coarse carpet stock.

Cincinnati.—WHEAT, choice red, at $1.18½; No. 2 red winter at $1,18; No. 2 amber, $1.15. CORN, 40½@41c. for No. 2. OATS quiet, but firm; No. 2 mixed at 35½c. RYE firmer at 81c. PORK firm at $10. LARD stronger at $6.85@6.90c. BULK MEATS in good demand; shoulders at 4c.; clear rib at 6½c.; clear sides at 6¾c. BACON in fair demand and firm; shoulders at 4¾c.; clear ribs at 6¾c; clear sides at 7¾c. BUTTER—Medium and the low grades difficult to sell for more than packers will pay. Weather too warm for roll butter to keep in good condition. Fancy creamery at 28@28c.; prime to choice do. at 25@26c.; choice solid packed dairy, 22@23c.; choice roll, 18@20c.; prime do, 15@16c.; medium do., 12@13c. and inferior, 8@10c. ₩ lb. CHEESE—Market firm for prime to choice factory at 11½@12½c. ₩ lb. EGGS—The supply ample; demand fair at 8½c. ₩ dozen for fresh. POULTRY—A good demand, and with moderate receipts the market is firm. Young spring chickens sell at $2@3, common old chickens at $2.75@3.25, and choice hens at $3.40@3.75 ₩ dozen. Ducks are dull at $2@2.50, and geese at $2.50@3 25 ₩ doz. Live turkeys sell at 10@10½c. ₩ lb. SEED—The demand has fallen off for nearly all kinds except millet, and prices are not much better than nominal. Clover is offered at 6½@7c. ₩ lb, and timothy at $2.60@2.70 ₩ bushel. There is a fair demand for German and common millet at 95c.@$1 and Hungarian grass at $1 ₩ bushel. Dealers buy flaxseed at $1.25 1.30 ₩ bushel.

Detroit.—WHEAT easier; No. 1 white Michigan at $1.15 asked and $1.14½ bid; April, nothing doing; May, $1.14¾; June, $1 14¼. CORN quiet but steady; No. 1 yellow at 43c.; high mixed at 42c.; No. 1 mixed at 42c.; No. 2 do. at 41c. OATS in active request; No. 1 white at 38½c.; No. 2 do. at 38c.; No. 1 mixed at 35½c.; No. 2 do. at 35c. CLOVER SEED a shade better at $4.10 asked and $4 bid for prime.

Indianapolis.—WHEAT weak; No. 2 red winter at $1.12@1.13. CORN firm at 36@37c. OATS firm at 33@35c. HOGS higher at $4.35@4.60.

Louisville.—WHEAT nominal; none on market: prices firm at $1@$1.05. CORN quiet; No. 2 white at 42½c; do. mixed at 41c. OATS firm; No. 2 white at 37½c; do. mixed at at 35½@36c. RYE firm; No. 2 at 81c. PORK quiet at $11. LARD firm; prime steam at $6.90. BULK MEATS steady; shoulders, 4½c; clear rib, 6½c; clear sides, 6 3-8c. BACON steady; shoulders, $4.70; clear ribs at $6.87½; clear sides at $7.50. Sugar-cured hams at 9½@10½c. MILL OFFAL.—Scarce and firm. Per ton in bulk; shipstuff $16@$17. HAY.—Prime to choice timothy $15.50@$17.50, and mixed at $12@$14 per ton on arrival. BROOM CORN.—Medium to prime, 4@6c per pound for straight; crooked, 3½@4c. FIELD SEED. There is very little inquiry for anything but millet and Hungarian. We quote, delivered from store; Timothy, $2.70; orchard grass, $1.40; red top, 65c; clover, common red at $4.25, and sapling at $4.50; blue grass, clean, 55c; extra clean, 75c; German millet, $1; Hungarian, $1. STRAW—$10 on arrival.

Milwaukee.—WHEAT opened strong, advanced 1c, and closed unsettled and weak; No. 1 Milwaukee hard at $1.19; do. soft at $1.17; No. 2 Milwaukee, cash and April, at $1 10; May, $1.10½; June, 1.08½; No. 3 do. at $1; No. 4 do. at 94½c.; rejected at 85c. CORN strong and higher; No. 2 at 36¾c. OATS scarce and firm; No. 2 at 30c. BARLEY unsettled, No. 2 spring at 71c. PROVISIONS—Mess pork quiet at $9 80. LARD—Prime steam, 6.93c. HOGS quiet but firm at $4.20@4 35.

Philadelphia.—WHEAT—Market greatly demoralized; Penn. $1.25; June at $1.22½; July at $1.11½; southern amber for milling on track at $1.32; No. 2 red April at $1.29 bid and $1.31½ asked; May at $1.25½ bid and $1.25½ asked; June at $1.22½ bid and $1.22½ asked; July, $1.11½ bid, $1.12 asked. RYE comes forward slowly; Penn. 83c. CORN very dull; very little demand, either for local consumption, export or options. Penn. western and southern yellow on the track and grain depot at 53@53½; Delaware yellow afloat, 53c.; southern white 50c. bid and 51c. asked for car lots in elevator. OATS firm for choice grades, but low grades dull and NO. 1 white at 46½c.; No. 2 do. at 44¼@45¼c.; No. 3 do. at 43@43½c.; mixed at 41@43c. Ohio strained at 42½c. PROVISIONS dull but firm. City mess beef at $13; beef hams at $17. Smoked hams at 9½@10½c.; do. in salt and pickle at 7½@9c.; clear rib sides smoked at 7½c.; do. in salt, 7c.; shoulders in salt, 4½@4½c.; do. sugar-pickled, 5@5½c.; do. smoked, at 5@5½c. Dressed hogs at 5½@6½. LARD—Western kettle at 7.50@7.62c.; steam, loose at 7.25c.; do. butchers' at 7c. BUTTER strong on scarcity; creamery extra at 28@30c.; Bradford county and New York extras at 26@27c.; Western Reserve extra at 24@25c.; do. good to choice at 20@23c.; rolls quiet, but firm; Pennsylvania extras at 19@21c.; Western Reserve extras at 20@22c. EGGS steady; Pennsylvania at 11c.; western at 10½c. CHEESE scarce and firm; New York factory old at 15@15¾c.; western full cream, none here; do. good at 12@13c.; half skims, 11@12c. SEEDS—Clover quiet at 6½@7¼c.; timothy steady at $2.90@$3; flax at $1.70@1 80. FEED in less demand, but steady. Bran at $21.50@22.50.

St. Louis.—WHEAT opened higher, declined and closed very unsettled; No 2 red fall at $1.13@1.14¾ cash; $1 12¾@1.13¾ for May; $1.06½@1.08½ for June; 96@98½c. for July; 90½@93c. for all the year; No. 3 do at $1.07¾; No 4 do at $1.02. CORN lower at 32c. OATS 30½@31c. RYE steady at 74c. PORK strong at $10.25 asked. LARD strong at $6.80 bid. BULK MEATS firmer; shoulders at $3.80@3.90; clear ribs at $6@6 05; clear sides at $6.20@6.25. Bacon higher; shoulders at $4.40; clear ribs at $6 80@6 85; clear sides at $7@7.10. HOGS steady; Yorkers at $4.15@4.25; bacon at $4.25@4.30; butchers' at $4@4.35; select at $4.35@4 50; rough mixed at $3.80@4.10. CATTLE easy; supply fair; demand moderate; light to good shipping steers 1,000 to 1,400 lbs. average, $4@4.75; prime to fancy heavy, 1,400 to 1,600 lbs at $4 80@5.10; butcher grades mixed, at $3@4; SHEEP scarce and wanted; fair to fancy heavy, $4.50@6; sheared $3.@4.25.

Fertilizers.

Bone ash is nominally quoted at about $22 per short ton, on the basis of 70 per cent. phosphate of lime. Bones quoted at $22 50@$23 for Texas and South American mixed, and $25@$26 do. for shin and shank bones. Refuse bone black at $21@$22 per short ton on merit. Sulphate of ammonia at 3½c. ₩ pound on the basis of 26 per cent. of ammonia. Dried blood at $2@$2 30 per unit of ammonia short ton. Ammonia, axotine, etc., for the former at $2 62½@$2 75 per unit of ammonia, and about $2 25 do. for the latter, all short ton. Nitrate of soda, 4½c. Saltpetre, crude 6½@6¾. The above are wholesale prices; at retail, goods are delivered at boat or cars at the following rates: pure ground bone 47 to 50 per cent. bone phosphate and 3 to 4 per cent. ammonia, $35@$40; dissolved bone black, 15 to 17 per cent. of soluble phosphoric acid $30@$35; dissolved bone 13 to 14 per cent. of available phosphoric acid $30; ammoniated superphosphate 10 to 11 per cent of soluble phosphoric acid, 3 per cent. of potash, 3 per cent. of ammonia, $40@$45; German potash salts, 25 per cent. of sulphate of potash, $15@$18 per ton; muriate of potash, 80 percent. 2@2½c per lb. land plaster 7.50; dried blood, 10 per cent of ammonia, $35@45 per ton; fish guano dry and ground fine, 10 to 11 per cent of ammonia, 20 per cent of available bone phosphate, $40@45; fish guano, 8 per cent of ammonia, $45; unground fish guano, 6 per cent of ammonia, $25; castor pomace; $19@24; sulphate of soda, ground, and in barrels, $15@18 per ton; sulphate of ammonia 4½c. ₩ lb; bone black, 70 per cent of bone phosphate, $30@32; ground South Carolina phosphate, 57 to 60 per cent of bone phosphate, $20 per ton; No.1 Peruvian guano, 10 per cent ammonia, standard, $55 per ton; Lobos $46 per ton; rectified $35 per ton; guaranteed $56 per ton; nitrate of soda, 5¼@5½ ₩ lb.

FORRESTER'S potato manure, $47.50; cabbage, $50; oat, $47.50; lawn dressing, $47.50; turnip, $52; grass, $45; hop, $47.50; strawberry, $42.50; wheat, $45; rye, $47.50.

STOCKBRIDGE'S manures quoted: Potato, $50; cabbage, $50; strawberry, $40; corn $45; seeding down, $40; orange tree, $35; onion, $50—per ton each.

MAPES'S complete manures for clay soil, $25.50 per 1,000 lbs.; for light soils $25.50 per 1,000 lbs.; "A" brand for general use, $20 per 1,000 lbs.; fruit and vine, $18.50 per 1,000 lbs.; cabbage and cauliflower, $23.75 per 1,000 lbs.; corn, $24.50 per 1,000 lbs.; potato, $24 per 1,000 lbs.; asparagus, $25.50 per 1,000 lbs.; gypsum, Nova Scotia, ground, ₩ ton, $7.50.

BOWKER'S "Hill and Drill Phosphate" $45; Bowker's Phosphate $40 ₩ ton, each; Bowker's "Food for Flowers," 55c. ₩ package and $3 ₩ doz; Bowker's "animal meal for lowls," $2 50 per cwt.; Ground oyster shells, $1 ₩ cwt.

BAUGH & SONS' prices for goods delivered at depot or boat, in bags and in 2,000 ₩ lots: Ammoniated dissolved bones, $35; pure bone meal, from raw bones, $36; Baugh's raw bone superphosphate $40; Baugh's $25 phosphate, $25; Baugh's A. A. nitrogen, 13½ per cent. of ammonia, $48.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, April 24, 1880.

BEANS AND PEAS.—Early in the week there were very liberal sales of beans for export including about 1,400 bbls.; chiefly marrows for Spain, and the market has ruled very strong. The feeling in the standard sorts is unusually steady for this part of the year, especially with potatoes ruling so low as they do. Fancy beans partake of the firm tone but there are no large sales of pea or kidney. Green peas steady at $1.80; Southern B. E. peas unchanged at $1.90@$2 per 2 bu. bag.

Marrow beans, prime, $1.67½; other, $1.50@1.62½; medium, prime, $1.47½@1.50; other, $1.30@1.42½; pea, $1.45@1.65; white kidney, $1.55@1.75; red choice, $1.50; other, $1.25@1.45; black, $2.05@2.10.

Receipts of beans for week, 2,350 beans; exports, 2,525 pkgs.

BROOM CORN.—There is little doing, with prices unsettled and nominal. Nominal quotations are for choice brush at 7@8c.; choice hurl at 8c.; stalk braid at 6@7c.; red and crooked at 3@4c.

BUTTER.—Supplies have largely increased and prices are lower and weak. This is the usual course of affairs in butter when perishable spring stock forms the supply.

THE PRODUCER'S PRICE CURRENT says:—"It is greatly feared that our dairymen are goingto commit an error this season in carrying too much spring and summer butter into the fall and winter. Those who held their butter last season and sold on the fall rise did better than those who sold steadily during the summer, and this experience will be likely to mislead a great many. The circumstances are now different. The low prices of last summer had the effect of closing most of the oleomargarine factories and it took them some time after the rise in the fall to get at work and re-establish their trade. The high prices during the winter and spring have given that article a wonderful increase of demand. It is not now probable that prices will be low enough this summer to drive it out of the field, if, as is claimed, it can be made and sold at a profit at 10c. per ₩. Any deficiency in the quantity of butter sent forward in the summer will, therefore, probably be supplied by oleomargarine, and in the fall the dairymen will find themselves with a very large supply on hand and the enemy in their path, in possession of the field, with all its connections made and offering its manufacturers a good profit at prices which would be very unsatisfactory to dairymen.

New Butter—Creamery best invoices 26c.; good to prime 24@25c.; fair to good 23@24c.; poor to fair 21@23c.; State, pails and tubs, choice, 25c.; good to prime 23@24c.; fair to good 23@23c.; poor to fair, 21@22c.; Western imitation creamery, 20@23c.; do. dairy fresh extra, 22@23c.; good to prime 21@22c.; fair to good 20@21c.; poor to fair 18@20c.; do. factory extra, 22c.; prime 21c.; fair to good 19@20c.; poor to fair 18@19c.; very poor 12@16c.

Receipts for week, 24,650 pkgs.; exports, 5,674 pkgs, mostly old.

CHEESE.—There is a freer assortment of new, but demand is fair, and prices are well supported. Old is in reduced stock, and prices steadily held.

New quoted at 14@15c.; fair good to very choice full cream, and 9@11½c. for skimmed and half skimmed; old State factory, best 14@15½c.; good to prime at 13¾@14½c.; fair to good at 13@13½c.; do. poor at 11½@12c. Ohio factory: Cheddar, fine, 14@14¾c.; do., fair to good, 13@13¾c.; flat, fine, 14½@14¾; flat, good to prime, 13¾@14¾c; flat, fair to good, 12½@13c.

Receipts for week, 14,730 boxes.

Exports, 12,400 do.

Liverpool cable, 75s.

Steam, 40s.

COTTON.—There has been more activity and prices showing wide fluctuations, closing weak at for April, 11.53@11.55c.; May, 11.57@11.58c.; June, 11.70@11.71c.;

July, 11.81@11.82c.; August, 11.89@11.90c.; September, 11.61@11.62c.; October, 11.09@11.11c.; November, 10.88@10.90c.; December, 10.85@10.88c.

DRIED FRUITS.—Apples are less freely offered, and there is a very good demand, especially for evaporated stock with prices steady. Peaches are quiet and unchanged. Small fruits are slow.

North Carolina apples, fair to good, at 7½@8½c.; choice, at 9@10c.; fancy at 10@10½c; Virginia, at 7@8c.; New York State quarters sliced at 7½@8½c.; patent evaporated, in cases, choice,, at 14½@15c.; good and prime at 13½@14c.; evaporated, choice sliced at 13@13½c., and good do. at 12@12½c. Evaporated peeled peaches, good to choice, at 27@28c.; North Carolina peeled, fancy, at 20c.; choice old at 17@18c.; Georgia prime at 16@17c.; fair to good at 14@15c.; common at 10@12c.; unpeeled halves at 7½@8c.; do. quarters at 7@7½c. Pitted cherries at 17½@19c. Blackberries nominal at 14c. Raspberries at 27@28c. Plums at 17@18c.

Exports for week, 200 pkgs. apples.

EGGS.—Receipts for the week, 17,875 bbls.; do. last week 16,630 do. The market has ruled weak since the recent heavy receipts and easy rates will rule until stock is less pressing. Receipts of Western are expected to fall off, but a good many eggs, the surplus of other cities, are seeking a market here.

Near Points, 13½c.; State and Penn., 11½@11½c.; Western, choice, 11@11½c; Southern, do., 10½@10¾c.; inferior, 10@10¼c.; duck, 15@16c.; goose, 25@27c.

FRESH FRUITS.—Baldwin and Russet apples now form the supply, ranging at $3@4 for fair to good; extra selections of Baldwins, $5. Exports for week, 3,126 bbls. Cranberries, $4@4.50 ₱ crate, held firm with scarce apples. Strawberries are doing better, owing to scarcity: Norfolk, 30@50c.; N. C. & Chas., 35@45c. Peanuts quiet and old rates are very full. Va. hand-picked 5½@6c.; extra prime, 5¼@5½c.; good to prime, 4¾@5¼c.; shelled, 5½@6c. Hickory nuts, 90c.@$1.

FLOUR—Has been depressed through the decline in wheat, and freely offered giving only moderate transactions.

Latest sales are at $3.50@4 60 for inferior to fancy superfine State and Western; $4.40@4 75 for poor to very good extra State odd lots and lines; $4 75@5.25 for very good to fancy do.; $4.40@4.75 for inferior to good shipping extra Western, and $4.75@5.25 for good to fancy shipping extra do.; inferior to very good white wheat extra, $5.00@5.75, very good to very choice do. at $5.75@6.15 (fancy brands held at higher figures); red and amber winter wheat, inferior to fancy trade and family, at $4.75@5.50; round hoop Ohio, $4.65@5 25; and trade and family brands of do. at $5.30@6.00; St. Louis at $4.75@5.65 for inferior to good extra; $5 65@6.75 for good to very choice; Minnesota clear, inferior to fancy, at $4 50@6.00; Minnesota "straight," inferior to very fancy, at $5.00@7.25, and patent very inferior to fancy at $6.00@8.25; unsound stock at from $2 60@5 00; city mill extra at $5.75@6.25 for fair to fancy West Indies; do. for England, $4.50@5.25 for poor to very fancy; do. trade and family extras, $6.25@7.00; do. for South America, $6.00@6.50; No. 2 at $2.65@3.85 for poor to very choice.

GRAIN.—Wheat has been much depressed and decidedly lower, rallying, however, a little towards the close; the decline resulted largely from speculative manipulation. Exports for the week have been 1,140,000 bush. Latest prices are for No. 1 white at $1.29@1.31; do. April at $1.30@1.31; do., May, at $1.26¾@1.27; ungraded white at $1.25@1.34; No. 2 red at $1.33@1.35; do., do. April option, at $1.34 @1.35¾; do., May at $1.29¾@1.32¾; do. June at $1.26¾@1.28¾; No. 2 amber at $1.32; No. 2 Northwest, May,, at 1.22¾@$1.23¾; No. 3 spring at 1.20; ungraded spring at $1.21@1.22. Corn has been unsettling, but closed strong and trade fair; latest sales are of New York No. 2, regular inspection, at 55¾@56¼c.; do., April, at 5.@55¾c.; do., May, at 47¾@48¾c.; do., June, at 47¾c.; do., July, at 48¼c.; New York steamer mixed at 55¾@56c.; ungraded mixed Western at 55@57c.; No. 3 at 56c.; No. 2 white quoted at 55½@56c.; steamer white at 55c.; yellow Western at 57¾c.; round yellow at 57@58c. Oats have been advancing but closed weak, with latest sales of No. 1 white 53c.; No. 2 white at 48@48c.; No. 3 white at 45c.; New York No. 1 at 42c.; New York No. 2 at 41@42c.; do., April, at 40¾c. do., May, at 38¾c.; No. 3 at 40c.; ungraded white Western at 44@46c.; ungraded mixed Western at 40@44c.; white State at 51@52c.; mixed State at 43c.; No. 2 Chicago at 42c.

HAY AND STRAW.—The offerings are more liberal but prices are well sustained.

Shipping hay quoted at 70c.; retail lots at 80@85c. for medium, and 85@$1, for better qualities; clover, 55@60. Straw at $1@1.05 for long rye; 65@70c. for short rye, and 50@60c. for oat.

Exports for week, 2,130 bales.

HOPS.—The demand is for light quantities, and prices still unsettled on other than choice lots. Quotations are for

	Cents per lb.
New York, fancy	Nominal.
New York, new crop, good and choice	33 @36
New York, new crop, medium	31 @33
New York, new crop, low to fair	27 @29
Eastern, new crop	27 @35
Wisconsin, new crop	27 @35
Yearlings	7 @18
Olds, all growths	4 @10
Pacific Coast, new	30 @35
Pacific Coast olds (nominal)	5 @10

LEATHER.—Quotations for hemlock sole are 23@26c. for light; 24@27c. for middle; 24@26c. for heavy, and 21½@c. for good damaged.

MAPLE SUGAR—Is scarce; it has seldom been so well sold up, cakes and molas, 12@14c.; sirup, in tin, 75c.@$1.

OIL-CAKE.—Western is quoted at $32 per ton.

POULTRY AND GAME.—Country scalded poultry is hardly wanted; near-by dry pickers and dressers, with what can be promptly called for, fully till present city wants.

Turkeys, choice, small, 14@15c.; medium, 13@14c.; fair to good, small, 12@13c.; large, 10@12c.; Phila., dry-picked, 14@15c.; capons, Phila. large, 21@23c.; small, 19@20c.; slips, 18@19c.; chickens, winter, large, Phila., 23@25c.; Phila., small, 27@30c.; spring, ₱ lb., 30@33c.; fall, Phila., dry-picked, 18@21c.; yearling, Phila., dry-picked, 15@17c.; fowls, Phila., dry-picked, 12@14c.; N. J., good to prime, 12@13c.; State, good to prime, 12@13c.; Western, good to prime, 10@13c.; poor to fair, 6@10c. Ducks, Phila. dry-picked, 18@19c.; squabs, white, ₱ doz., $1.50@2.75; dark, $1@1.50.

Live poultry has arrived freely, but has found ready sale at good prices. It hardly pays to send extremely small chickens.

Chickens, spring, large, per pair, 75c.@90c.; small, 50@60c.; fowls, Jersey, ₱ lb 12@13c.; Western, 11½@12c.; roosters, 6c.; turkeys, mixed, 11@12c.; ducks, Jersey, N. Y. & Pa., per pair, 75c.@$1; Western, 60@75c.; geese, Jersey, $1.50@1.75; N. Y. & Pa., $1.25@1.50; Western, mixed, $1@1.12; pigeons, ₱ pair 35@45c.

Wild pigeons obtained a run of trade during the low prices, and are now steady at better figures; quoted $1@1.12. English snipe and plover, $1.25@1.50; land snipe, 35@40c. Wild ducks not wanted.

PROVISIONS.—Hog products have been active and higher; mess pork quoted at for April at $10.60@10.70; May at $10.60@10.70; June at $10.65@10 75; July at $10.75@10.80, and August at $10.85@10.90. Bacon at 6¾ for long clear and 7 for short clear. Beef at for extra India mess at $18@20 for city and $19 for Philadelphia and at $10.50@11 for extra mess, and $10 for plain mess. Beef hams at $17.25@17.50. Stearine at 7¾@7¾c. for Western. Tallow at 6 1-16 for prime. Lard—Western steam at 6.35@7.37½ for spot; 7.32½ for April, 7.30@7.32½ for May, 7.35@7.37½ for June.

Receipts for week, pork, 2,100 pkgs.; beef, 735 pkgs.; cut-meats, 31,573 pkgs; lard 20,200 pkgs. Exports for do., pork, 7,500 pkgs.; beef, 1,950 pkgs.; cut-meats, 10,425,000 lbs.; lard, 10,043,100 lbs.

SEED.—Clover is quiet; Western is quoted at 6¾@7¾c., and State at 7@8c. Timothy is quiet at $2.40@2.50.

TOBACCO—Has not varied in price and trade moderate.

VEGETABLES.—Exports for week, 1982 bbls potatoes. The offering of new is larger but in many instances badly packed and called. Old quiet and in buyers favor for all sized quantities. Bermuda, now ₱ bbl. $6 00@6 50; Savannah, $4@4.50; Florida, Rose, $4@5; Chili Red, $4@4.50; chils, $2.50@3; Early Rose, N. S., bulk, per bbl. $1.25@1.37; Maine, per d.-h. bbl., $1.75; @1 87; State $1.25@1.50, in bulk ₱ bbl. $1.25@1.50; prolific N. S., per d.-h. bbl. $1.25@1.37; In bulk $1.25@1.37; Mercer, bulk, ₱ bbl. $1.00@1.12; Chili Red, bulk, ₱ bbl, $1@1.12; Peachblow, State, white, per d.-h. bbl., $1.50@1.75; red, $1.37@1.50; N. J. ₱ bbl, $1@1.25; Snowflake, State, $1.50@1.75; Peerless, State, $1.00@1.12; bulk, $1; Jersey, bulk, 70@75c.; Sweet potatoes, ₱ bbl. $2.75. There is a very fair demand for green stuff but buyers insist on prime quality and condition, stuff has to sell on its me its after novelty wears off. Tomatoes, Fla., ₱ bu. cr. $2@5; Bermuda, 60@9 c., beets Bermuda, new, ₱ crate $2@2.25; Fla., $1.75@2.50; cucumbers, Fla., $2.50@3; String beans, Sav. $4@4.50; wax beans, Fla., $2.50@3; string beans, Florida, round, $2.50@2,75; Fla, flat. $2@2.25; squash, Fla., white, $1@1.25; green peas, Norf., ½ bbl. crate, $3.25@3 50; N. C., ½ bbl, cr. $2.50@3; Ch'n & Sav., $1@1.50 Asparagus, Jy. per doz, bun. $3@4.50; Md. and Del $3@4.50; Norf., $3@4; kale, L.I. ₱ bbl., $1; spinach, L.I. ₱ bbl. $2@2.25; Baltimore, $2.00; radishes, Norf., ₱ 100 bunches, 25@75c.; squash, marrow, per bbl., $1.75; Hubbard, $1.75; cabbage, Norf., $1.50@3; Ch'n and Sav., $4@4 50; Fla., new, $4@4.50; rhubarb, L. I. & Jy. pr. 100 bunches $2.50@3; onions Bermuda, new ₱ cr $2 25; white, ₱ bbl., $4.50@6; yellow, $4; red, Eastern, $4; beets, Jersey, $2@2.35; turnips, Russia, 75c.@$1.25; carrots, $1.25@1.75.

WOOL.—There has been much less life to the market, with prices unsettled and rather easy, especially on the better grades. Quotations are for:

Ohio, Pennsylvania and Virginia, XXX and picklock, 58@59c.; XX, 54@56c.; X, 53@55c.; No. 1, 59@62c.; No. 2, 54@56c.; common, 50@53c.; combing, 58@61c.

New York Michigan, Indiana and Wisconsin, X and XX, 50@55c.; No. 1, 50@53c.; No. 2 51@56c; common, 47@50c.; combing, 54@59c.

Iowa, Vermont and Illinois, X and XX, 49@53c.; No. 1, 57@60c.; No. 2, 49@54c.; combing, 51@59c.

Missouri, Kentucky and Tennessee, washed fleece, 54@59c.; unwashed fleece, 41@46c.; unwashed combing, 42@47c.

LIVE STOCK MARKETS

NEW YORK, Saturday, April 24, 1880.

BEEVES.—Receipts for week, 12,108 head; do. last week, 13,101 do. The market has been buoyant and wholesome all the week; quality of stock was fine and recepts just scant enough to make some share competition among buyers. Very little stock sold below 9c. A few rough oxen sold at 8c., to dress 55 lbs.; common to prime steers, 8¾@10c., to dress 56@57 lbs. There was an absence of fat heavy cattle, but an average grade like the one just closed out is more suitable for the trade at this season than heavy weights. Exports for week, 1,300 live cattle; 4,210 quarters; 700 live sheep; 1,100 carcasses and 200 dressed hogs.

COWS AND CALVES.—Good to prime milkers wanted at $35@55 per head.

VEAL CALVES.—Receipts have moderated and prices are firmer for prime live. Dressed have had a further lo-e with a continuance of cool weather. Live calves, Jersey and Bucks Co., choice, 6¾@7c.; prime, 6@6¼c.; State, choice, 6@6¼c.; do. prime, 5¾@6c.; fair to good, 5@5¾c.; poor, 4@4¾c.; Mt. Holly, good to choice, 6@7¼c.; buttermilk, 3@4c.; grass, 2½@3c.; calves, hog-dressed, Jersey, choice, 9½@10c; good to prime, 8½@9c.; State, good to prime, 8½@9c.; fair to good, 7@8c.; poor to fair, 5@7c.

SHEEP AND LAMBS.—Receipts for week, 19,775 head; do. last week, 23,111 do. Butchers wanted all offering, and the pens were soon cleared at a small fraction advance from the high figures of Thursday. Two car loads of unshorn sheep were sold at 8½c., two cars at 8c., and several deck loads of common to fair at 6¾@7¾c.; a lot of 61 head of clipped do. at $5.80 ₱ 100 lbs.; 4 car loads at 5¾c. ₱ lb., and about the same number at 5¼@5½c.; a load of unshorn yearling lambs at 9½c., some clipped do. at 5½@6¾c., and a few spring lambs at $5.50@6 50 per head. Dressed mutton advanced ¼c. ₱ lb. and had quick sale at 10@10½c. for the best.

SWINE.—Receipts for week, 32,598 head; do. last week, 34,100 do. Nominal rate for corn-fed, 4½@4¾c. Supply all sold.

Country, dressed, 50 to 125 lbs., 7@7¼c.; 125 to 200 lbs., 6¾@7c.; 200 lbs. up,, 6¾@6¾c.; city dressed, 6¾@6¾c.

Simple, Strong, Durable, Rosette Wheel and perfectly Self-regulating, avoiding 100 wearing joints. Also, Steven's Pony Feed Grinder and a perfect Rotary Motion attachment, without gearing, the power being communicated by the lift or up stroke of Pump Rod. Can be used for cutting feed, churning, &c. The best, cheapest and most useful power in the market. Full particulars, circulars, &c., sent free. Address the Manufacturers. CLARK & CO., SOMANAUK, ILL.

ANNOUNCEMENT.

LEWIS SCHILLING, the Originator of the **Celebrated Premium Bone Fertilizer**, formerly manufactured by him at the EXCELSIOR FERTILIZER WORKS, SALEM, OHIO, has sold out his **Salem Mill**, and has taken charge of the business of a New Company at **Alliance, Ohio.** The rapid growing demand for my Pure Premium Bone, and the want of Extensive Facilities for manufacturing, as well as the want of the necessary Capital to accumulate the stock needed to fill my orders, will account for the change in locality.

At Alliance I have the benefit of being at the Junction of the Pittsburgh, Ft. Wayne & Chicago and the Cleveland & Pittsburgh Railroads. I have a private track to my manufactory, and I will have the Capital to enable me to accumulate a large amount of stock ready for a rush of business at seeding time. My customers will please direct all letters pertaining to the purchase of Premium Bone, or the sale of Bones to

STOCKBRIDGE MANURES For 1880.

Some years ago the Stockbridge Manures were only known to a few farmers in the Connecticut Valley. Now they are so extensively used in different parts of the country as to require two large factories, one in New York and one in Boston to manufacture them. This increase shows what farmers think of good fertilizers, and is not only due to the fact that they are reliable, well-made, and high-grade manures, but also to the fact that farmers have

FOUND THEM PROFITABLE TO USE.

Now that corn, and other farm produce is bringing such good prices, we anticipate that farmers will invest still more largely in our fertilizers.

Besides the Stockbridge Manures, we manufacture several high-grade Phosphates, and deal in first-class chemicals of all kinds. Farmers who intend to use Fertilizers of any kind, should

McSHERRY GRAIN DRILL

Unquestionably the Best.

Sows Fertilizers splendidly. It is very accurate. It regulates by cog wheels. It is light draft. It is easily managed.

It is strictly first-class in workmanship and construction. Works to the entire satisfaction of everybody who knows what a grain and fertilizer drill ought to do. Its sterling qualities have gained it a world-wide reputation, and all who appreciate excellence and accuracy, prefer the McSHERRY.

Send for pamphlet. Mention this paper.

Reading for the Young.

FLORICULTURE FOR YOUNG PEOPLE. No. IV.

JOHN N. DICKIE.

Arrangement of Flowers in the Garden.

No matter how fine the flowers are you raise, they never will appear to advantage unless properly arranged. I would rather see a neatly laid out garden of dandelions, burdocks, thistles, ironweed, clover, etc., than a mixed up jingle of the finest flowers that ever bloomed. I saw a flower bed once I shall never forget. It was about twenty feet long and five feet wide. In one end was a bunch of asparagus (or "sparrowgrass" as they termed it) overshadowing a lot of sickly Portulaca. Next came some Gomphrena (English clover) grown in a clump, tall and spindling; then Bachelor Buttons, Pansies, a bunch of Hollyhock, Poppies and a number of other plants I cannot now recall, making what I may properly term a floral jam of the first magnitude.

Never crowd your flowering plants. Give them plenty of room and they will give you double the quantity of larger and finer flowers. Transplant at any time. I have set out plants not an inch high during a drought when the soil was apparently as dry as the dust in the middle of the road, and never offered to shade them, and still rarely lost one. As soon as they are in I pour water *by the side of the plant*. This does not wash away the soil, and is the only proper way to water young plants. Last season was exceedingly dry here. I had a lot of Japan Pinks sown in a frame late, and they were very small—not over a half inch high. I transplanted them on a hot day, in a dry soil, but only lost one plant out of a lot of over two hundred. In August I had the finest display of this flower I have ever seen.

To those just beginning the culture of flowers, I would recommend their arrangement in beds as often seen in kitchen gardens. In setting your plants observe this rule, viz., to set low flowering plants nearest the main walk, and the taller sorts in the rear. Portulaca is one of the lowest plants we have. Japan Pinks, in rich soil will grow a foot or more in hight. Verbenas should always occupy a front bed. Browallia should take a back seat; also Poppies, Salvias, Zinnias, etc. The rule is simple enough, and a little care in the arrangement will give you a flower garden worth the name.

But many of my young readers will not be able to have a flower garden, and will only have a half dozen varieties or so. Then let me tell you a very attractive way to arrange them. Get a little plot of ground, spade it deeply and manure it *moderately*, for soil can be made too rich for flowers. Now lay it out in drills two feet apart, each drill being long enough to take each variety. Put the lowest growing in front, and the next highest second, etc., until you form a sort of floral pyramid, which it certainly will be if you make the proper choice.

I shall have a large flower garden this year, and one of the beds will be arranged thus: At the rear, Ricinus (castor oil bean) then Cannas, then Salvias fronted by Balsams, Dianthus, Verbenas and Portulaca, in separate curved rows. This will make a beautiful bed, and my young readers of the RURAL can do as well.

Before closing this series of articles, I wish to caution my young friends about purchasing greenhouse flowers. Suppose you wish a dozen Verbena plants, the great majority of them will consist of a single stem with one flower thereon. Don't buy these. Insist on short plants with no flowers. You will then get something that will bloom in a reasonable time after planting them. Pansies forced into bloom in pots are never so good as these short, stubby ones which people reject, because they have no flowers. Of course, Geraniums, Fuchsias, &c., are a different class of plants, and can be bought safely in flower.

In closing, I must say, I hope to hear good reports through the columns of the RURAL from numberless little flower gardens throughout the country. Nothing is more elevating or refining than floriculture for the house, lawn and garden. When people raise flowers merely to sell, it becomes floriculture for money, and the work then loses half its charm.

Morrow Co., Ohio.

ROBINSON CRUSOE.

DEAR UNCLE MARK:—Kept indoors by a steady rain-storm, I find opportunity for fulfilling my promise to give the cousins a description of my island. It is not quite so desolate as Robinson Crusoe's for it is inhabited and in the place of his "man Friday," I have my Pink to blossom by my side, and to give color and fragrance to my existence; and instead of a cat, I have my cunning little Juaneta to cuddle in my arms for caresses. I fancy the scenery of my island, too, is grander than Alexander Selkirk's nor is mine a "lonely isle of the sea," but one of many, forming an archipelago of an arm of the Pacific known as Paget Sound, which is almost surrounded by the Coast Range whose lofty peaks are crowned with eternal snows, while the islands are clad in perpetual green. Protected on the north and east, by mountains, and fanned by the mild breezes from the ocean, on the south and west, our climate is uniform throughout the year, winter venting itself in rain. Deciduous trees drop their leaves here, as elsewhere, but this has little effect upon the appearance of nature, since majestic evergreens hang out their curtains of unchanging verdure and long moss, to conceal the bare limbs of their less modest neighbors. Here luxuriate the fir, cedar, spruce, hemlock, pine, juniper, yew, and manchineel. The fir grows to the height of 200 or 300 feet, and is valuable for ship-building, particularly masts and booms. The cedar is used for shingles stakes, rails, as it splits so evenly and smoothly. Wild flowers cover the open places on the bluffs while glaucous ferns fill the more fertile spots in the valleys; for our island is diversified with mount and vale, cataract and lake, the last filled chiefly with trout and covered with wild ducks and yew. In the dense forest, lurks the timid deer whose branching antlers make for a huntsman, a rack unique and appropriate, for his musket, shot and powder-flask, game bag and fur cap. On the main land we have the bear, black, and grizzly wild-cat, panther and other vicious animals and as king over them, (and perhaps not less dangerous) the Red Man, whose revenge is proverbial, and whose offspring inherit the treachery of Spanish ancestry. For a livelihood they hunt and fish, and carry on traffic with the Hudson Bay Fur Company by means of a jargon called Chanuke. It is amusing to hear them wor-wor, (talk) Chanuke. Miker is you. Cumtucks is understand; Miker cumtucks wor-wor Chanuke? means, Do, you understand Chanuke? Answer, Na whitea (yes), or Halo (no). Niker means I or me; clativa, go, begone; clatrowyler, good day, howdy; chuck, water; muce-muce, cow; eloce, horse; Highas Tlo, chief; Highas sockie Tie, God; ix, one; mox, two; eloon, three; locket, four; quinum, five.

The beach is strewn with shells and pebbles, the most curious of which is the "sea egg" (local name; Uncle Mark, please give us the right one) shaped like a trophy tomato, and bristling like a chestnut burr, with thousands of bony points which may be rubbed off leaving the shell smooth with a purple tint, and its beautiful tracery of natural lace work. [Sea egg or sea urchin are the correct common names for this class of radiates. The generic name is Echinus, and the species most common on the American coast is called Toxopneustes drobachiensis—which is even worse than Chanuke. U. M.] The "match-safe," or barnacle, with its half dozen delicate cells, is also curious, and would make a mermaids' vase with compartments for grouping different colors of flowers. The most valued of the pebbles is the agate, which is transparent. Others are beautifully marbled as Castile soap. Our Island is noted for the enormous size of its berries. Imagine you see Juaneta with a strawberry as large as a hen's egg, in each little dimpled hand, crushing it in her effort to grasp it, while the crimson juice oozes out between her fingers. In like proportion are raspberries and gooseberries and currants. Apples, pears and plums reach the greatest perfection here, but the nights are too cool for peaches and too damp for grapes. Plants may be transported from here with safety. I have tested it. Our florist, "Panama Jack," would exchange some for greenhouse plants, if "the cousins" will address him at Lopez Island, Washington Territory.

WILL-O'-THE-WISP.

AUTOGRAPH VERSES.

As some of the little readers of THE RURAL NEW-YORKER may receive autograph albums as presents from their friends, and be troubled to find some verse suitable for an "opening piece," I send the following to meet the emergency, and also a few verses suitable for little folks to write in their friends' albums:

DEAR FRIENDS:—
Here is a place
For you to trace
A pleasant word or two.
If hard to find
Words to you mind
Your name alone will do.

For a Boy's Autograph Album.

FOUR "BE'S."

Perhaps it may not *be* your fate
In life to *be* among the great,
But *be* it ever understood,
You mean to *be* among the good.

ANOTHER.

Always remember 'tis the wisest plan,
Not to give up, but do the best you can.

ANOTHER.

Be true to yourself; be true as the needle
That steadily aims its slim point to the pole;
Be true to your God and regardless of evi
In purity ever keep sacred your soul.

For a Girl's Album.

May the loved friends who walk by your side
And ever advise you aright,
Be heeded by you, then with Christ as your guide
Your path through the world will be bright.

ANOTHER.

The work we ought to do
To-day, should be well done,
It may not be our lot to view
To-morrow's rising sun.

For a Gentleman.

The eagle aims its flight to reach the sun,
By stern endeavor victories are won.

ANOTHER, IN SUMMER.

My mower waits 'mid fields of waving hay,
While with my pen "Forget Me Not," I'll say.

Niagara Co., N. Y. SOPHIA C. GARRETT.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK AND COUSINS:—I received the seeds sent me all right, and was doubly glad to get them, for I did not expect to get any because I wrote so late. I shall try my best with them, and next fall I will tell you how I succeeded. I must tell you, cousins, about my adventure in the woods. Wishing to get some rich soil for my Double Chinese Pinks my sister and myself climbed into our great wagon, and, driving a spirited span of greys, we set out for the woods. We drove back in the woods for about a quarter of a mile, when all at once the wagon tongue came out, and before we could stop the horses they ran against a tree, upsetting the wagon and spilling us on the ground. We scrambled to our feet again and looked around for our horses; they had broken loose and were running toward home. They soon ran against a tree, however, and one of them fell down, but not hurting itself seriously. We brought them back to the wagon, but we were unable to replace the tongue in its proper position; so mounting a horse each we went to get our big brother to help us. He soon had the wagon right side up, and, placing the soil which we had gathered in it, we started on the journey home, where we arrived in safety. We gave the horses over to our brother's care, and were soon engaged in putting the soil in boxes and sowing different varieties of seeds. MATIE.

Stryker, Ohio.

DEAR UNCLE MARK:—Here comes another of those letters asking to be admitted into the large circle of cousins, if you and the cousins are willing. Most of the letters I have seen in the RURAL are from those wishing to become members; why don't the other cousins wake up and write oftener? I intend to write again if this does not find an untimely grave in the waste basket. I intended to begin my garden this week, but if it remains as cold as it is to-day the seeds will be just as well off if not planted. I thank the RURAL for the seeds received, and hope they will do well. I think those of the cousins that have "big brothers" that are willing to help them with their gardens should consider themselves well off. But never mind, girls, those of us who have none will do the best they can. AGGIE.

Waushara Co., Wis.

DEAR UNCLE MARK: If you were to see the wild flowers that cover this wild and mountainous region throughout the summer you would think we needed anything else more than a flower garden here. But the sight of wild flowers creates a desire to cultivate and surround one's house with the beauties that have been improved by cultivation. I have several kinds already started in botes and by the time the ground is sufficiently warm out-of-doors to receive them they will be nearly ready to bloom. Brother John is thinking of cultivating a small patch of vegetables this summer the success or failure of which I will write you of together with my own. Yours truly,

Clearfield Co, Pa. ALLIE A. STOWELL.

DEAR UNCLE MARK:—I have been thinking a long time I would like to join the Horticultural Club. My father has taken the RURAL twenty years and we like it very much. I am going to try and raise a good many flowers this year if the chickens don't help me too much. They scratched so last summer that they spoiled nearly all our flowers and vegetables. But we are going to keep them shut up this summer, and I think we will have better success. We have a good many house plants, and I love to take care of them and see them grow. SWEET-BRIER.

DEAR UNCLE MARK:—I am a little girl eight years old and live at the edge of Hoopeston, Ill. We take your paper and like it very much. My papa is a preacher of the Christian Church in Hoopeston, and is a good papa, I think. We have lots of fruit and will have lots of flowers this summer. I have a pet bird and a kitten. The kitten's name is Mischief and the bird's name is Simon. As this is my first letter I will close for fear you will not publish it. I am getting a piece out of your paper to speak at school. I think it is very nice. Good-bye. MYRTA B.

Hoopeston, Ill

DEAR UNCLE MARK:—I am a little boy eleven and-a-half years old. I go to school about six months of the year. I wish to join the Horticultural Club. I take an interest in flowers, vegetables, fruit and bee-keeping, but as I do not know much about any of them, I wish to get all the information possible. I have just the dearest baby brother you ever saw (that is to me). My mother has a great many flowers. I like the RURAL very much. Yours truly, ALVIN L. POTTER.

N. H., Coos Co.

DEAR UNCLE MARK:—As I saw my last letter in print, I will try again. I will not have so many flowers to write about. I am pleased to think that Uncle Mark sent seeds to the cousins again this year. I wonder if any of the cousins have a bow and arrow. I have a bow with which I can shoot one hundred yards, if any of the cousins have a bow please describe it in the paper. I intend to have a garden this year. ROVING BOB.

Jacksonville, Ills.

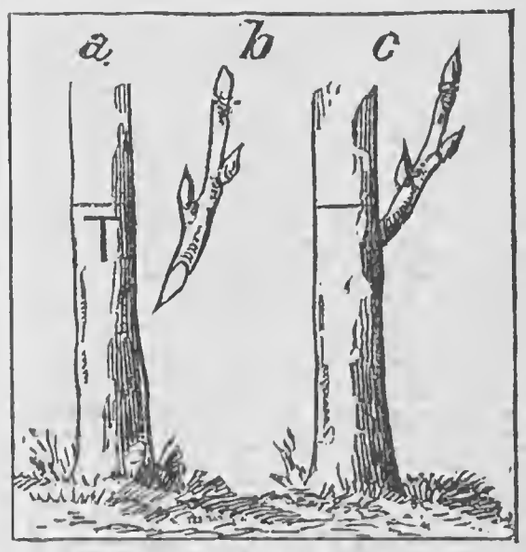
Various.

BRIEFLETS.

THE Marquis of Lorne, in the National Hymn or Anthem which he has composed, makes rhymes of "nurture," and "hurt her," and "hours," and "ours." . . . An incensed dairyman calls Oleomargarine "Bread Salve." . . . A contemporary says: "Let beginners abandon learning to graft until they have mastered the art of budding." Oh, no. The one is as simple as the other. In the one case a stem is inserted into a slit made in the wood. In the other, a bud is inserted into a slit made in the bark. . . . Our readers must not forget the "White Elephant" which we propose to introduce to them in due time. . . . There is very little doubt that London Purple will be used extensively the coming season in place of Paris-green. It is cheaper and just as efficacious. . . . Mr. William Parry places his "Queen of the Market" and Cuthbert at the head of the list as the most valuable hardy of Red Raspberries for home use or market. We shall be glad to find that there is some (even the slightest) difference between the Cuthbert and "Queen of the Market.". . . It is proposed to change the name of politician to pollutician, because the creature more than any other pollutes the stream of liberty. . . . Land and Home thanks its contemporaries for their entertaining obituary notices....The Herald says that the promised spectacle of an English earl in the character of an American stock breeder may arouse a few of our own wealthy citizens to a realization of the value of some of our almost neglected resources that invite enterprise and promise profit....H. B. Ellwangor mentions, in the Country Gentleman, the Jefferis, Fameuse, Jonathan and Northern Spy as the four best apples for table use yet produced. Though inferior to the Spitzenburgh in flavor, they are superior as regards crisp flesh, which is so tender that it almost dissolves in the mouth. The four sorts ripen in the order given, and furnish fruit from early autumn until late spring....Whatever else may happen to a nominee, he can count surely on one thing—on being proved by his opponents to be as vile a creature as ever lived.... Dr. Schenck told a story at Mr. Hamersley's dinner of a great divine who said that when he made an important mistake in speaking, he always corrected it on the spot, but that he passed a trivial error by without notice. Acting on this principle, when he referred to the devil as the father of lawyers instead of liars, he passed on, thinking that so *trifling* a mistake as that would hardly excite attention. A judge, at whom the shaft was aimed, immediately replied, that while the devil was probably necessary to lawyers, it was certain that he was absolutely indispensable to the very existence of the clergy....Mr. Collins, of Waterford, N. J., has been shipping cranberries since early in January. He picks out all imperfect berries and obtains in consequence a higher price than the current rate....If you could only persuade yourself to be glad that things are no worse, instead of grumbling that they are as bad as they are, you would materially increase the possibilities of happiness. . . . If you will settle down to the fact that success is hard to win, and then train your muscles to the work, you will get on far better than by regarding yourself as an unappreciated genius whom a cold world neglects.—N. Y. Herald. . . . Professor A. J. Cook, of the Michigan Agricultural College, finds London Purple very effective with the potato beetle. He finds one pound is enough for 100 gallons of water. It is more diffusive than Paris Green, and therefore needs less stirring to become well mixed with water. . . . The New York State Fair will be held in Albany September 13th . . . D. D. T. Moore, for many years the editor of this journal, is announced as editor of an agricultural department of the "Christian at Work." . . .

A GOOD METHOD OF GRAFTING.

A METHOD of grafting fruit trees is represented below. At a, the stock is represented, which may be any tree, not over six inches in diameter, or a branch of any form which it may be desirable to graft. A cut is made precisely as in budding, and the cion (b) is inserted instead of the bud. Completed a side view would appear as in c. *Any number of cions* from one to a dozen may be inserted, according to the size of the stock. Bast may be used to wind about the wound, but it is not needed. Grafting wax to exclude the air is sufficient. This method of grafting has many advantages over the methods usually practiced. If the cion should fail the stem is not injured and may again be grafted another year. The dotted line shows where the stock may be cut off when it becomes apparent that the cions have not taken. We have practiced this method, and with very little care success is almost assured. Of course, the cion should be nearly or quite dormant, and the bark part readily from the wood. Try it RURAL readers.



A METHOD OF BARK GRAFTING.—FIG. 140.

CLYDESDALE HORSES.—The sale of a draft of 19 of these from the shed of Lord Dunmore, on the 26th of February came off at Glasgow. They brought from $65 to $1,600, according to age and merits.

PERSONAL ITEMS.

Mrs. Nellie Grant Sartoris is to leave England next July for a visit to this country.

Mrs. General Sherman has raised and forwarded to Ireland $4,000 and is still at work.

Miss Jennie Flood, who is to marry young Grant, is not handsome, but her income is perfectly lovely—'tis $100,000 a year.

The only survivor of the bloody struggle at the Texan fortress of Alamo is Colonel Frank, W. Johnson, who is writing a history of Texas.

The widow of the late Gen. J. E. B. Stuart of Confederate cavalry fame, has been elected principal of the Virginia Female Institute at Staunton.

Mr. Yates says that Lord Beaconsfield was never in better health, and when the present crisis is over, will doubtless thoroughly relish a complete repose among the sylvan groves of Hughenden.

A fretful mother and cross child indicates ill-health, requiring only Hop Bitters to remove.

Implements and Machinery.

THE ALBANY CORN PLANTER

PLANTS ALL KINDS OF SEEDS WITH PRECISION.
Awarded the Highest Medal at the Centennial, as being the best Planter.
SAVES ITS COST IN PLANTING FIFTEEN ACRES OF CORN. One man and a horse can plant from seven to ten acres of corn in one day, with the Planter, at a cost of from $3.50 to $4.

COST TO PLANT FIFTEEN ACRES BY HAND:

Marking, man and horse, 2 days, at $3	$ 6.00
Planting, twelve men, at $1	12.00
Board, ten men, two meals each, at 25c	5.00
Wasted, one bushel of corn	1.00
Total cost by hand	$24.00

Self-Operating
SULKY RAKE.
IMPROVED LION,
Best Rake Made in the World.
Send for Circular, etc., to O. H. P. CORNELL,

HOOSIER CORN DRILL!
60,000 IN USE.

Drops, with great regularity, one grain in a place, either 12, 16 or 20 inches apart, does the covering uniform in depth, and is both time and labor saving. A given area of corn planted with this machine contains as many plants as when hilled, but their arrangement is such that *each* plant has access to the *same* amount of plant-food that must necessarily be *divided* between from 3 to 5 plants when huddled together in a *hill*. Hence a healthy start and vigorous growth of the plants and the consequent production of **large, well matured** ears, by which the quality is improved, and the yield increased from 10 to 20 bushels per acre, over hill planting are natural results following the use of our **Corn Drill.** Send for circular.

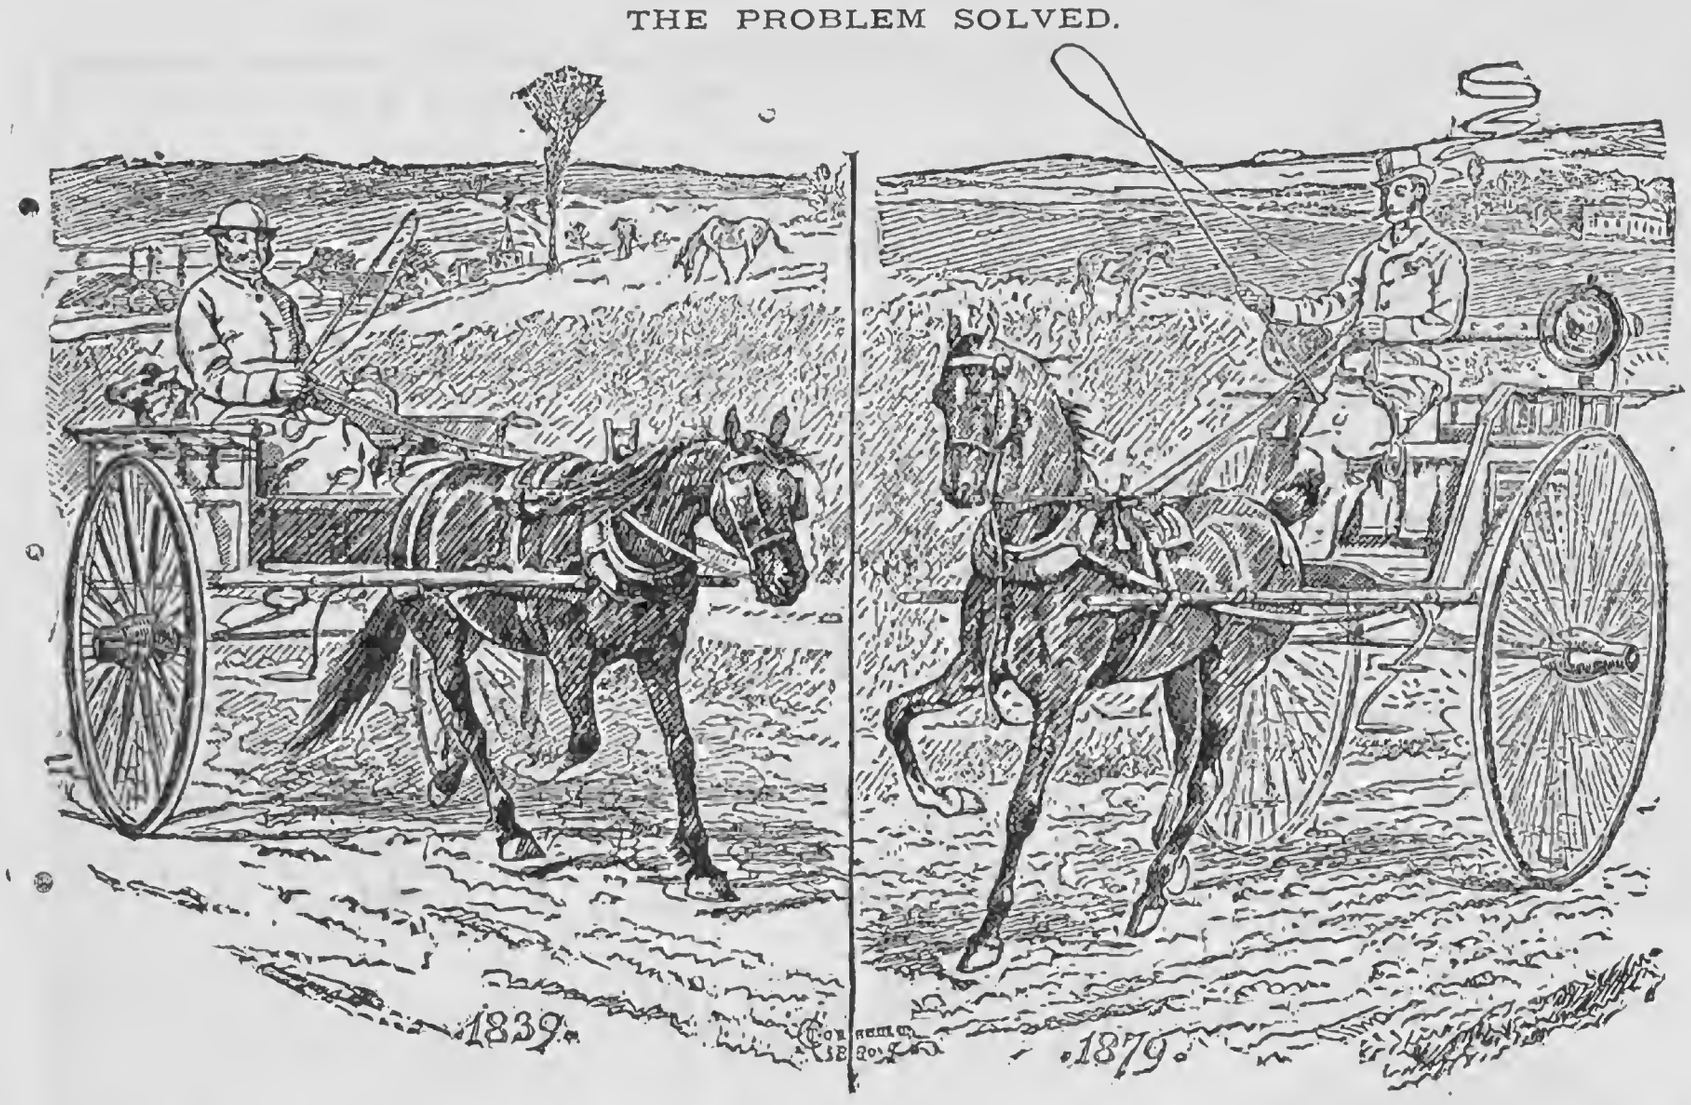
THE PROBLEM SOLVED.



ENGLISH FARMERS COULD LIVE THEN. THEY CAN'T LIVE NOW.—*Punch.*

Safety from a Pestilential Scourge.

Protection from the disease, not a medicinal agent which merely checks the paroxysms, is the grand desideratum wherever the endemic scourge of malaria prevails. Quinine does not afford this protection. The chief reason why Hostetter's Stomach Bitters has won such imminense popularity is that it prepares the system to resist the malarial pest. This it does by bracing, and toning the physical organism; regulating and promoting an equal flow and distribution of the animal fluids, and establishing digestion on a sound basis. Not only is fever and ague prevented, but the worst types of the disease are conquered by it. Such is the only just conclusion to be drawn from the overwhelming evidence in its favor. It is equally efficacious in dyspepsia, constipation, liver complaint, and general debility, and rheumatic complaint, and is a reliable diuretic and nervine.

Butter made by this process, awarded Sweepstakes at International Dairy Fair, 1878, and Two Gold Medals and First Premium at same fair, 1879. First Premium at Royal Agricultural Exhibition, London, 1879.
It requires no milk-room.
It raises all of cream between milkings.
It affords better ventilation.
It requires less labor.
It is more thoroughly made.
It is cheaper,
and gives better satisfaction than any other way of etting milk.
Send for "Dairymen" giving full particulars and testimonials.

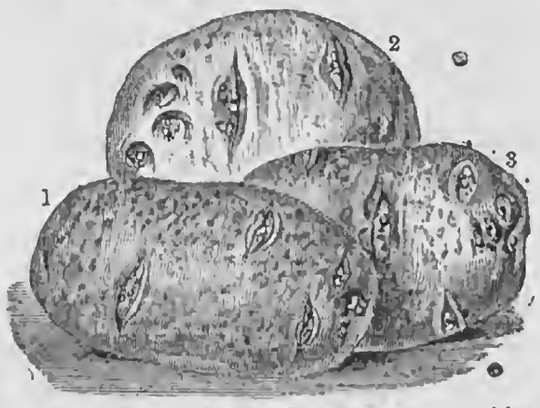
Flower, Vegetable and Field Seed, Vegetable and Flowering Plants and Small Fruits,
MAILED FREE. 80 PAGES—450 ILLUSTRATIONS
80 STATE STREET, Albany, N. Y.

***My Annual Catalogue of Vegetable and Flower Seed for* 1880** rich in engravings, from photographs, of the originals, will be sent FREE, to all who apply. My old customers need not write for it. I offer one of the largest collections of vegetable seed ever sent out by any seed house in America, a large portion of which were grown on my six seed farms. *Full directions for cultivation on each package.* All seed *warranted to be both fresh and true to name;* so far, that should it prove otherwise, *I will refill the order gratis.* The original introducer of the Hubbard Squash, Phinney's Melon, Marblehead Cabbages, Mexican Corn, and scores of other vegetables. I invite the patronage of *all who are anxious to have their seed directly from the grower, fresh, true, and of the very best strain.*
NEW VEGETABLES A SPECIALTY.
JAMES J. H. GREGORY, Marblehead, Mass.

THREE NEW POTATOES.



1. Pride of America.—In appearance resembles the Snowflake, a few days later; very productive, large size, an excellent keeper; of superior quality.
2. Matchless.—Tubers very handsome, round; pale-red; flesh fine-grained, pure white, and of excellent quality. A great cropper, an excellent keeper.
3. Silver Skin.—A cross between the Early Rose and White Peach Blow. Tubers medium to large. Skin smooth, silvery white, russetted. Flesh snowy white, fine grain, splendid quality, an excellent keeper.
Prices of each of the above, $1.00 per lb., 3 lbs. $2.50 by mail, prepaid. By freight or express at purchaser's expense, ¼ Peck, $3.00; 1 Peck, $5.00; ½ Bushel, $7.00; Bushel, 12.00; Barrel, $25.00. All other varieties at market prices.
Bliss' Illustrated Potato Catalogue, contains a descriptive list of all the new varieties recently introduced, with many other desirable sorts, beautifully illustrated. Centennial collection of 500 varieties. Also much useful information upon the cultivation of this valuable esculent. 10c. Address

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

Vol. XXXIX. No. 19.
Whole No. 1580.

NEW YORK, MAY 8, 1880.

Price Five Cents.
$2.00 Per Year.

[Entered according to Act of Congress, in the year 1880, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Rural Architecture.

OUR NEW OFFICE.

As our readers are aware, we have for some time contemplated the removal of the offices of the Rural New-Yorker from No. 78 Duane Street, where the paper has been published during the past six years, to a more convenient location. It became necessary that we should occupy quarters which would facilitate the transaction of our enlarged and constantly increasing business. This removal has now taken place, and in the accompanying engraving we present to our readers a view of the building containing our new offices. It is most conveniently situated on the corner of Park Row and Beekman Street, the very center of the most busy region of this busy metropolis. The street in which the horse car is seen, in the engraving, is Park Row. As this street is the chief outlet from the old parts of the city to the streets on the east side, the sidewalks are always thronged with pedestrians and the roadway busy with vehicles of all kinds.

To the left in the engraving is Beekman Street, while diagonally across from the Rural office and in full view from all its windows lies one of the "lungs" of the city—the City Hall Park—with its green lawns, fountains, and shade trees. Directly opposite the Rural offices on Park Row stands the $11,000,000 Post Office, while within a block on either side are the Herald, Times, Tribune, World, Sun, Mail, Evening Express, Scientific American, Nation, Turf, Field and Farm, Practical American, Truth, and a score or two more political, scientific and specialist papers.

A GENERAL PURPOSE BARN.

The accompanying figures represent plans of a barn recently erected by one of my neighbors, Mr. F. S. Clark. It is most emphatically a barn for all purposes. The owner is not only a good farmer, but he is also a good carpenter, and these plans are the result of years of experience and due consideration of the purposes for which the barn was to be used.

The structure measures 58 x 36 feet, and is built on a gentle slope facing the west. Most men would have thought it impossible to arrange the building so that hay and grain could be driven into the third story, but the owner found this both possible and practicable. The basement, or first floor, is eight feet high. Besides the windows marked W, there are four panes of glass in each of the doors, D, which, together, give all the light that is needed. The space not otherwise marked is used in the fall for storing corn fodder, pumpkins, etc., and at other times for the stabling of calves and incoming cows. To serve this purpose better, pens are formed by panels which can be put up and taken down as occasion requires. One end of this floor and the entire adjacent side are built into the bank, as indicated at B. In this cool corner is constructed an ice-house, at the end of which the stairs, S, lead up to the next floor. At P, is a hog-pen, at H, a hen-house, the dimensions of each being indicated in the plan, and at S are stanchions for ten cows.

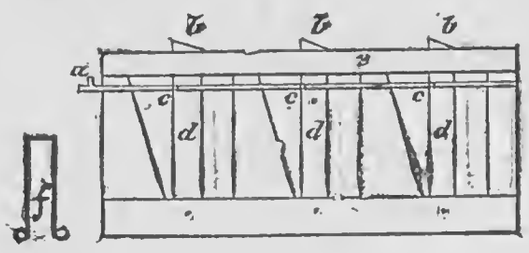
The second floor is nine feet high. Here is the horse-stable (indicated at H S), with adjoining harness room, box stall and a store-room for bedding. The stairs at S lead to the third story, and the open space not otherwise marked is used as a store-room for wagons, ma-

VIEW OF THE OFFICE OF THE RURAL NEW-YORKER.—Fig. 141.

chines and other farm implements. The floo in the horse-stable is perfectly tight with a slight inclination, so that the liquid can run into the hog-pen, and the manure is dropped through trap-doors either into the hog-pen or cow-stable, as may be desired.

In the third story is the thrashing floor, F, which is sunk two feet below the rest in order to drive in under the plate. The bridge from the embankment is shown at B. The frame is of hemlock, covered with pine boards one foot wide and battened with molded battens 3½ inches wide. The roof is covered with Michigan pine shingles and surmounted by a ventilator.

Mr. Clark has an improved stanchion of which the following is a description:—



STANCHION FOR CATTLE.—FIG. 141.

The fastening, *f* is made of ⅜-inch round iron, with an eye at each end. This is fastened on top of the top piece, *c*, by staples through the eyes. This fastening has the advantage over most others, that the cattle cannot reach it with their horns and unfasten themselves, as they sometimes do with others. The stanchions are represented as closed; *a* is a lever running the entire length of them; behind each latch, *d*, is a pin, *c*, in the lever. The lever runs loosely, and when the cows are turned out, it slides back; when they again come in their places, by pushing the lever from left to right, the pin *c* pushes the latch *d*, in place, and the fastening *f* runs up the incline *b*, and drops down, and the latch is closed.

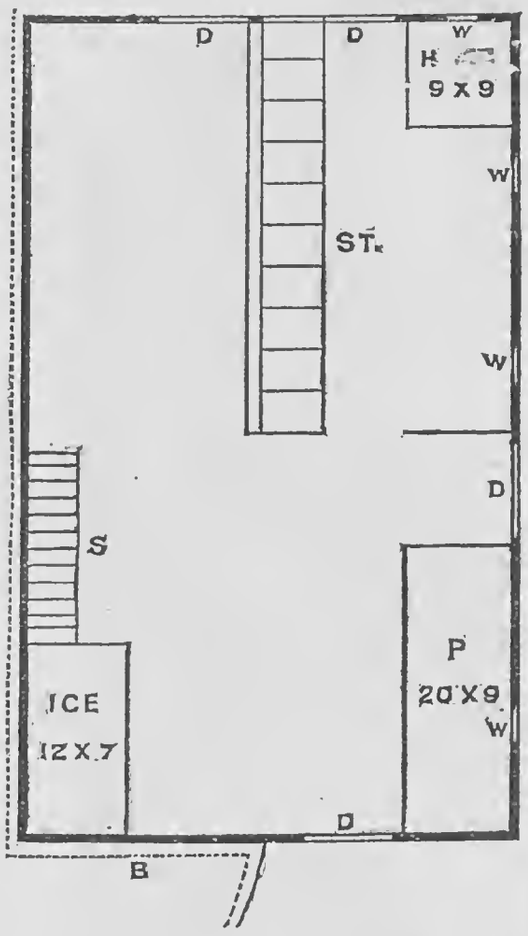
Horticultural.

SOME NEW EVIDENCE IN RESPECT TO WEEVIL-EATEN PEAS.

PROFESSOR F. H. STORER.

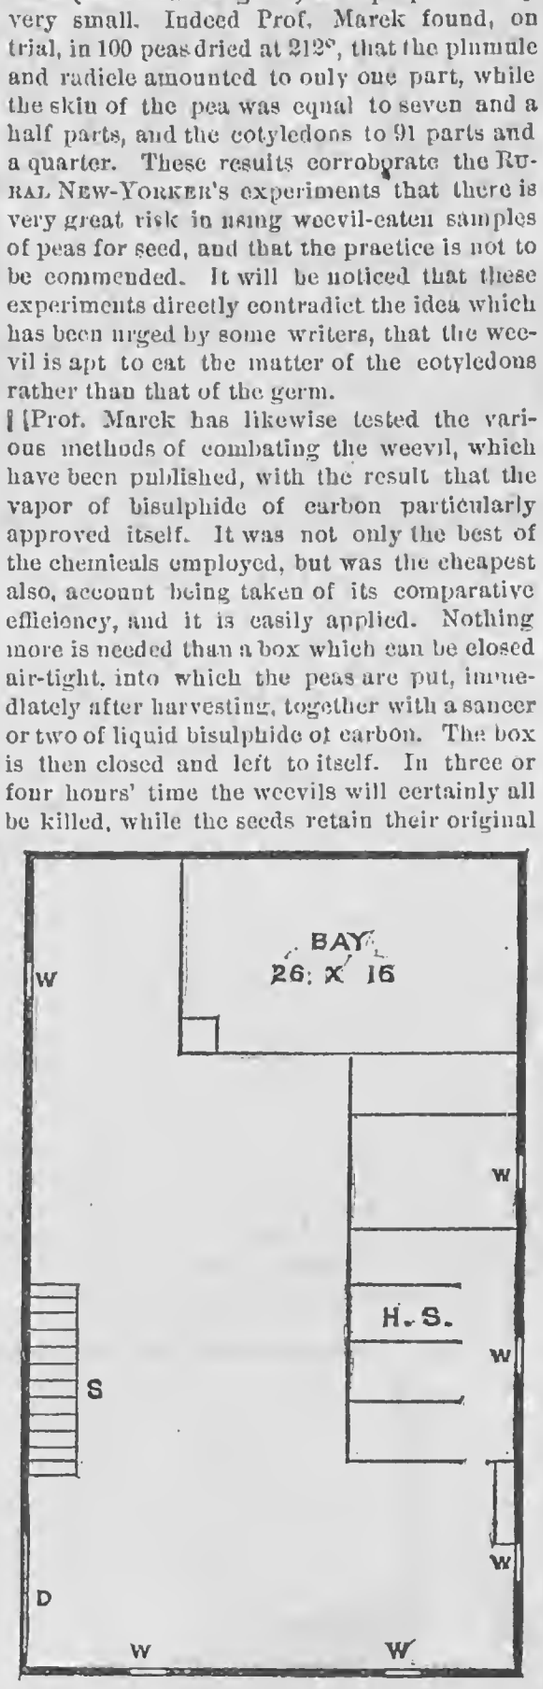
The Austrian, Prof. Marek, reports as the result of his investigation of weevil-eaten peas, that out of every 100 peas actually attacked by the weevil only 20 germinate on the average; that is to say, 80 per cent. of them are absolutely useless as seed. Among the 13 varieties grown by him, it was noticed that sugar peas were more readily attacked by the weevil than field peas, and that, as was to have been expected, two kinds which were sown three weeks earlier



BARN FIRST FLOOR.—FIG. 142.

than the others suffered special damage. The Bishop's pea was chosen for his more detailed experiments, and of every 100 seeds of this variety from 38 to 42 were attacked by the weevil, that is, 40 per cent., on the average. On weighing samples of sound and damaged seeds, it appeared that a given number of the latter were 23 per cent. lighter than the same number of sound peas. Out of every 100 of the damaged peas it could be seen that the radicle and plumule of 74 were so much eaten that they were manifestly unfit for germination, and only 13 seeds were found in 100 with their radicle and plumule unharmed; that is to say, the gnawed portions of the seeds were generally precisely those which are most essential for germination, and the risk is all the greater since these more vital parts of the seed (the so-called germ) are proportionally very small. Indeed Prof. Marek found, on trial, in 100 peas dried at 212°, that the plumule and radicle amounted to only one part, while the skin of the pea was equal to seven and a half parts, and the cotyledons to 91 parts and a quarter. These results corroborate the RURAL NEW-YORKER's experiments that there is very great risk in using weevil-eaten samples of peas for seed, and that the practice is not to be commended. It will be noticed that these experiments directly contradict the idea which has been urged by some writers, that the weevil is apt to eat the matter of the cotyledons rather than that of the germ.

Prof. Marek has likewise tested the various methods of combating the weevil, which have been published, with the result that the vapor of bisulphide of carbon particularly approved itself. It was not only the best of the chemicals employed, but was the cheapest also, account being taken of its comparative efficiency, and it is easily applied. Nothing more is needed than a box which can be closed air-tight, into which the peas are put, immediately after harvesting, together with a saucer or two of liquid bisulphide of carbon. The box is then closed and left to itself. In three or four hours' time the weevils will certainly all be killed, while the seeds retain their original



SECOND FLOOR.—FIG. 143.

form. They may be kept through the winter without further damage from the weevil, and are in a salable condition; though Prof. Marek recommends that, in using such seeds, from 25 to 35 per cent. more of them should be sown than would be needed if every pea were perfect. Next to the bisulphide of carbon, he found sulphide of ammonium an efficient agent, but it is somewhat objectionable in that it colors the peas and imparts to them a rather persistent and not agreeable odor. The vapors of alcohol, ether and prussic acid, applied in the same way as those of the bisulphide of carbon, all served a good purpose for killing the weevil, though the ether is hazardous on account of its easy inflammability, and the poisonous property of the prussic acid would naturally exclude it from common use. Probably the light naphtha distilled from Pennsylvania petroleum could be used with advantage, in the same way as the bisulphide of carbon, if proper care were taken in handling this highly inflammable liquid.

The idea of leaving the peas until the second year with the view that the beetles shall die off in the course of the summer, and so leave the seed free from insects, is an error, since the bugs do more harm while they are alive than there is gained by finally getting rid of them. By using solutions of chemicals, such as the sulphocarbonates and xanthates of potash or soda, or carbolic acid, the bugs may be killed without substantial detriment to the seeds, but the process is inconvenient since the seeds swell up in the liquids and need to be spread out and dried, unless they are to be planted immediately. But special appliances are needed for these operations, and care must be taken to avoid mold, and, at the best, the seeds become crumpled and wrinkled and lose the good appearance which is needed to make them salable. The old method of baking the peas to kill the weevil is not particularly commendable, since the insects are usually not all killed by it, while there is considerable risk of injuring the germinative power of the seed. Moreover, it gives the peas a dry, faded appearance, as if they had been kept for years.

HORTICULTURAL EXPERIENCE IN ALABAMA.

The climate of this locality is liable to frost from Oct. 15 until May, and to freezes after rains during nearly as long a time. My soil is a thin forest loam over sandy clay, with no lime discernible within reach. The forest growth consists of Hickories, the White, Red, Black and Chestnut Oaks, Maple, Gum, Sassafras, Pine, Sumach, Chestnut and Grape-vines—chiefly Labrusca.

Squashes.—Of the fine Northern squashes, I have planted packets marked Hubbard, Butman, Marblehead, Cocoa-nut and Yokahama. The only one of these that ever lived out its season and fruited well is the Cocoa-nut, and even this is generally, like the rest, early ruined by a white worm that eats out the pith of the vine, entering at any part of it. The so-called Hubbard, indeed, bore a little, but its fruit was nothing like that described. On the other hand, the Kershaw, large, white-necked, is never attacked by this worm and suffers little from the squash bug. It is a nice sort, but liable to rot about midwinter.

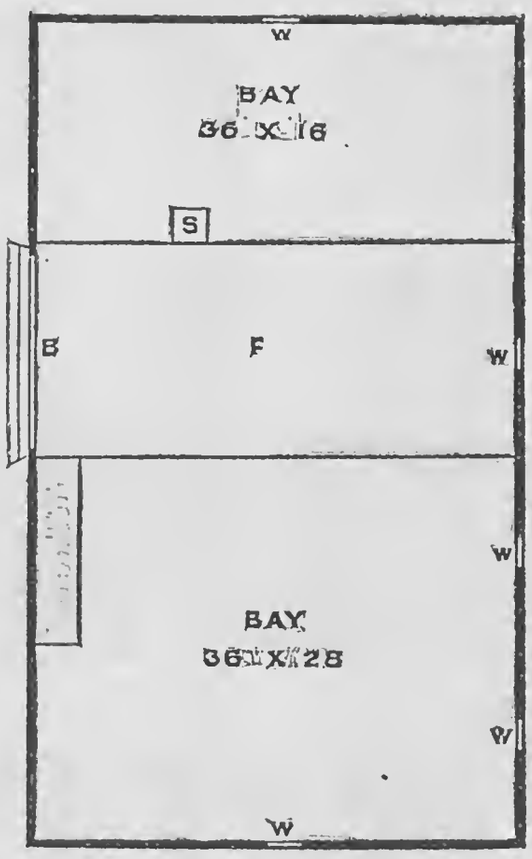
Turnips.—I sowed, early last spring, the Sweet German turnip and later, the Jersey Navet. The Sweet German was good through the summer, despite drought, and I ate it until after frost, while the Navet became tough and worthless after a few weeks. Both Sweet German and German Teltow produced tough and tender roots in the same bed and at the same time.

The Chufa does not sprout until about July, and is killed by either drought or frost; consequently it is worthless as forage and cannot hold its own with the native grasses, but dies out as soon as you cease cultivating it.

The Triomphe de Gand Strawberry withstands heat and cold well, but will not fruit well in strong, stiffish alluvial ground, where all growth is most luxuriant.

The Sweet Vernal Grass cannot live without so much weeding and watering that it is really worthless on the mountain.

Beets:—Vilmorin's Sugar is less thrifty, less vivacious, and makes greater demands on culture than the mangel-wurzel, but the latter is no forage plant here, as described at the North and in England, and its large root, worthless for the table, is also slighted by stock when they can get any thing else to eat. A good thrifty beet and carrot are much needed for milk in winter. I shall now try Lane's Sugar. I suppose that a sandy soil favors the production of sugar as is shown in Florida by the sugar-cane and the orange, and here by sorghum, peaches, melons, etc., but some potency latent in the seed must determine both the nature and quantity of secretions. When at college, in N. C., Prof. Mitchell at Chapel Hill, who had studied the geology and mineralogy of that region, affirmed that he could tell by the quality of sweet potatoes on which side of a line they were grown, the said line being the limit of the sand-stone formation in that vicinity. At the North I never found, except in New Jersey, a sweet potato worth eating; but I doubt if the growers know enough to procure the right sort of seed potatoes. This plant reaches perfection about Wilmington, N. C. I have met with none of equal quality out of the Carolinas; but Southeastern Georgia supplies the same conditions and, I suppose, with the same results.



THIRD FLOOR.—FIG. 144.

Beans present to soils remarkable tests. Here, for example, the Royal Dwarf Kidney, the White Marrow, the Algerian Pole Wax, the Limas and several speckled beans thrive and yield abundantly, while Ferry's Golden Dwarf Wax and Hawley's Scarlet-runner hardly bear at all. They probably require some specific manure.

In chemical analyses it is evidently important to designate the *variety* as well as species operated upon, and unless the chemist can differentiate varieties by the proportions of their relative constituents, his art is not adequate to the problems of horticulture. While the Hickory is the dominant growth here, I cannot get a Pecan nut to germinate. Certain Figs and the Shaw Cantelope grow luxuriantly, yet will not ripen their fruit. Gardeners need chemical tables exact and complete for the soils in which given varieties have reached perfection, and also thermometrical tables of the bottom heats, as well as of the atmospheric ranges of temperature. Difficulties in the germination of seeds oppose a chief obstacle to the popular development of both useful and ornamental cultures.—E. M. Lazarus, M. D.

Marshall Co., Ala.

THE CHERRY AS A LAWN, SHADE AND ORNAMENTAL TREE.

E. WILLIAMS.

In years past the fruit-planting mania has been confined chiefly to the Apple, Pear and Peach, the Cherry, save to a limited extent, being almost entirely ignored. This, no doubt, is due to the fact that the former offer a more reasonable prospect for certain profit in the way of a family or market supply, the latter being less certain of yielding a regular store of fruit, and the object of this brief article is, not to commend its extensive planting for the market, but for home use and embellishment. In making up a collection of trees for the lawn or about the house for shade, the Cherry could be very appropriately used to a considerable extent.

Among the long list of varieties, the habits of growth and the variation in foliage cover a wide range, and when clothed in royal robes of white blossoms in early spring, with the green leaves surmounting the whole by way of contrast, there are few trees more beautiful for the lawn. The blossoms very seldom fail, and if succeeded by a crop of fruit, or even by a partial one, it is just so much in its favor over a merely deciduous tree, and what reasonable objection is there to combining the useful with the ornamental in this way, save that it is not in strict accord with the established rules of ornamental planting. I favor and commend the innovation, if such it is.. Childhood's recollections of thousands of once happy country homes would lose half their charms if divested of the old Mazzard or Black Cherries and their associations. While there are hundreds and thousands of amateur and professional fruit growers in the country, who can count their varieties of Apples and Pears by fifties and hundreds, those whose fingers' ends will not suffice to number the kinds of their Cherries are comparatively limited.

Formerly Cherries were classified in three divisions:

1st. Heart varieties—those of tender, sweet flesh.

2d. Bigarreaus—with firm or solid flesh.

3d. Dukes and Morellos—with acid flesh.

The increase in number of varieties, however, and the modifications of the distinctive characteristics of the second class—the firm flesh—have been so great as to make it difficult to tell where the tender flesh of the Hearts leaves off or the firm flesh of the Bigarreaus begins, so that those of rapid and free growth are grouped together in one class, and the Dukes and Morellos, being of dwarfer habits, comprise the second class; but to the uneducated in pomolgical lore all our cherries are embraced under the names of white and black Ox-Hearts, English red, or pie cherry, and the common black; and to talk to many of the different varieties by name is to talk in an unknown tongue.

Twenty years ago Downing, in his "Fruits and Fruit Trees of America," enumerates and describes over 100 varieties of the first class and over 25 of the second class, many of which, however, are but little known.

Among the leading and best known kinds of the first class may be named: Yellow Spanish, Napoleon Bigarreau, Rockport Bigarreau, Coe's Transparent, Elton, Governor Wood, Cleveland Bigarreau, Ohio Beauty, Early Purple Guigne, Black Tartarian, Black Eagle, Tradeseant's Black Heart, Downer's Late Red, etc.

Of the second class are May Duke, Reine Hortense, Bell Magnifique, Belle de Choisy, Early Richmond, Late Duke, etc.

The black-knot sometimes and in some localities proves disastrous to the latter class, rendering them more uncertain than the others, while the fruit of the first class is largely dependent on the condition of the weather at the time of ripening, a few dull, warm days often sufficing to destroy the whole crop. Still, with all these uncertainties in view, I advise planting them more liberally than is usually done, for ornament as well as for use. A few bushels or even quarts of nice, perfect cherries are a good thing to have in their season. If the curculios manage to sting all of a light crop, the birds can take care of the young larvæ and the cherries too at the same time, and sing their sweetest songs while so doing. I admit it is rather provoking at times to have them take the "lion's share," and more, too, but the shade and beauty of the tree are yours, and to insure a share of the fruit, plant a few more trees.

Commence now—1880 is a good date to remember.

Almost any soil not absolutely wet is favorable to the growth of the tree. Either as a shade for the windows of the dwelling or about the door, on the lawn or along the border of a carriage drive, they can be used with propriety. For the latter purpose dwarf trees of the first class, worked on Mahaleb stocks are as desirable as the less vigorous trees of the second class.

A Remedy for the Pea Weevil.—A correspondent from Swoope's Depot, Va., says, in answer to a late inquiry in Querist Dep't, that he has found a safe protection for his seed peas, in storing them in a strong-scented cigar box, or in placing a lump or two of gum camphor among them.

Weevil in Peas.—For many years I have practiced pouring boiling water on peas before sowing, and letting them stay in the water over-night. They then come up quickly, and I am never troubled with the bothersome little bugs. M. E. A.

Field Crops.

SOME OF OUR LEADING GRASSES.

PROFESSOR W. J. BEAL.

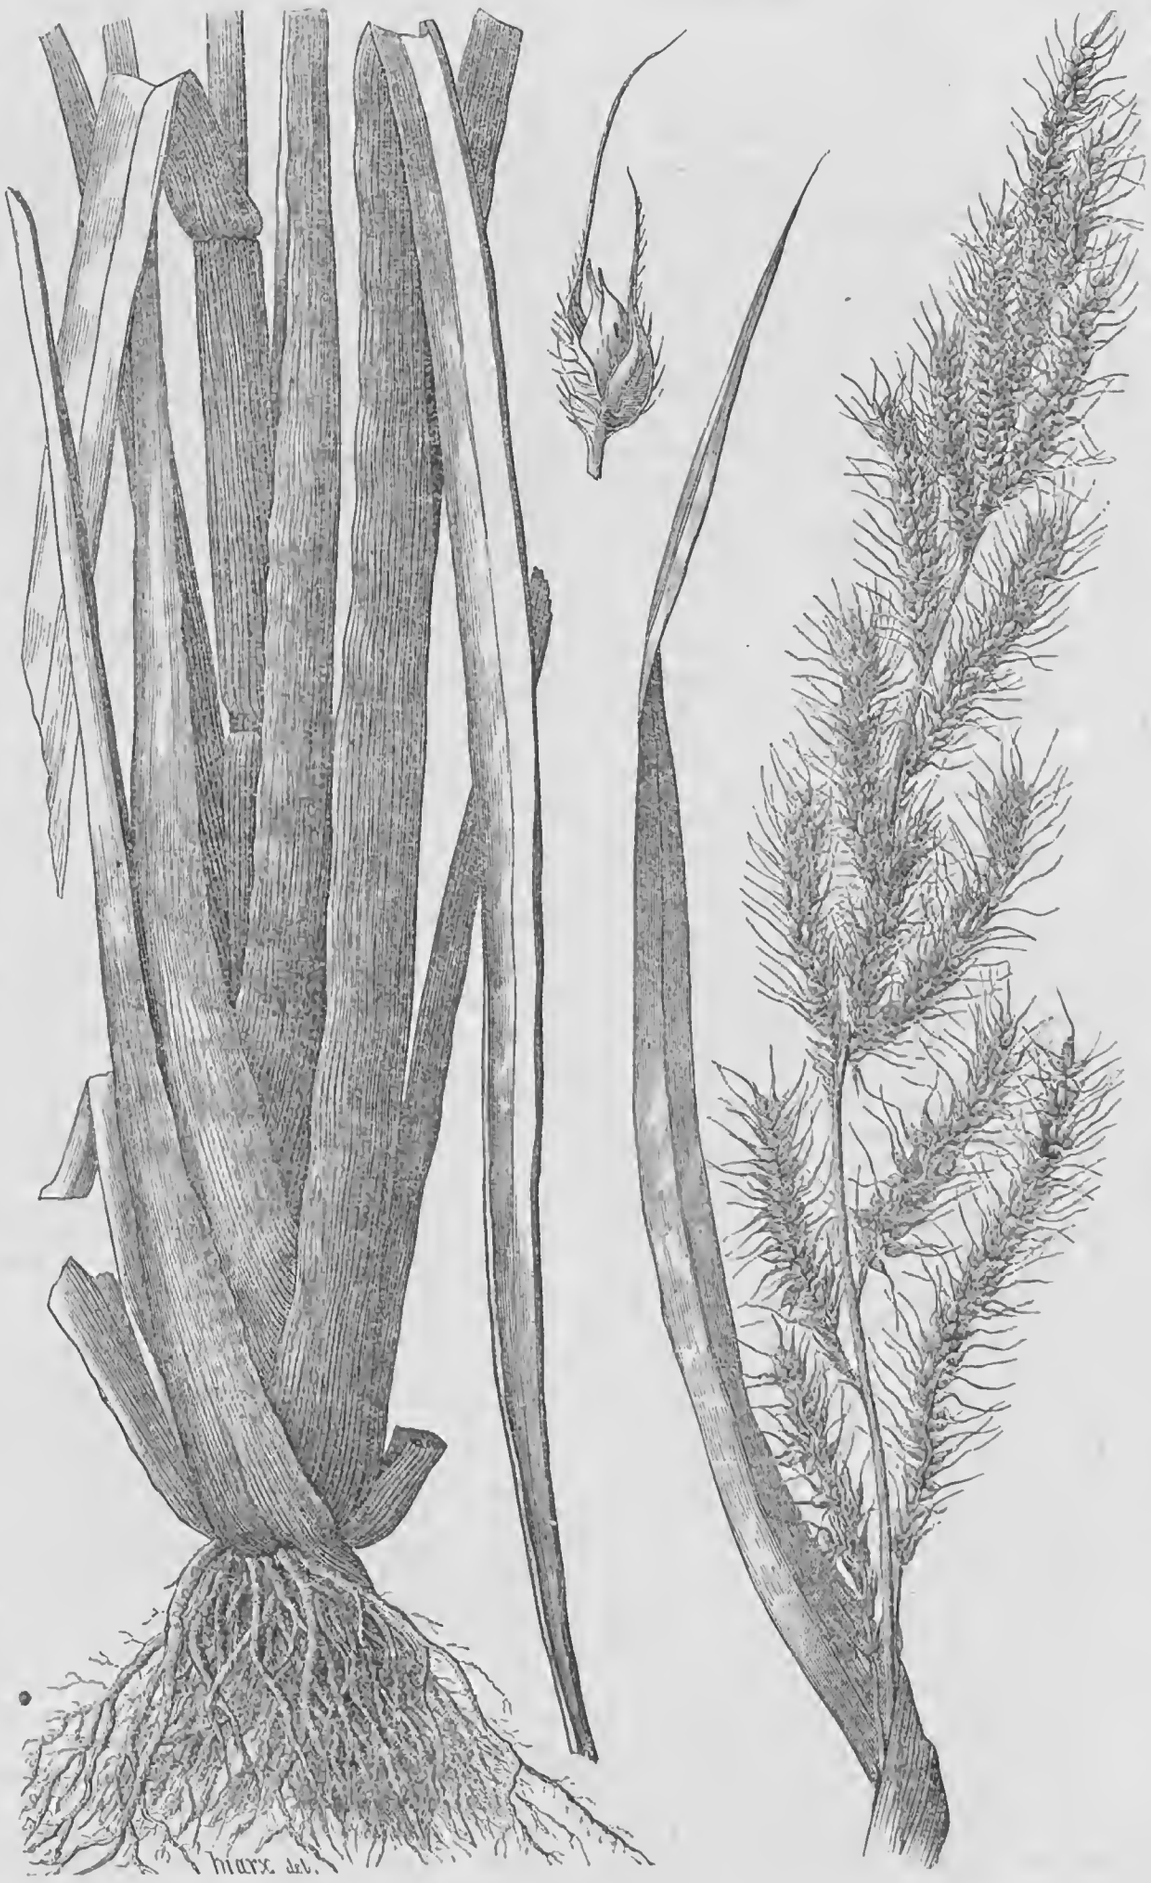
Drop Seed, Nimble Will.—Muhlenbergia Diffusa.

This is a low grass, about eighteen inches high with slender, contracted, much branched panicles. These come out one after the other at any time during the latter part of summer, and blossom at different times. The grass is a perennial and thrives on dry hills and in shade or partial shade. The rhizomas run and spread somewhat like June grass, only much less rapidly. The opinions as to its quality are various. The lower stems, after they begin to branch, soon become quite hard and woody. The leaves are very thin, and, except the woody stem, the whole plant is very light. Stock seem to like the grass. The genus is named after Dr. Muhlenberg, an American botanist. There are five other species, perhaps more, in the United States. They resemble each other very much in quality and appearance. In certain places, the writer has seen several of these in considerable quantity. Especially has he seen one species, M. Mexicana, three feet high, quite thick on rich river bottoms. Another, M. sylvatica, is found in thin woods in the Northern States. Another, M. glomerata, has dense panicles, not unlike orchard grass in appearance, except that the panicles are of lead color. It has frequently been collected on marshes and brought to me as a grass of great promise. Some call it wild timothy. The illustration gives a good idea of the first species named. The beginner will remember that the panicles branch much, new or younger panicles coming out from the sheaths of the leaves; that the roots-stocks branch and run; the leaves are thin and light, the stems hard and wiry. There are but few grasses which can be confounded with these species of Muhlenbergia.

MUHLENBERGIA DIFFUSA.—FIG. 145.

Barnyard Grass, Cock's-Foot Grass,—Panicum Crus-galli.

This is an annual which varies much in appearance, so much so that even very good botanists have labeled specimens under several different names. The flowers of some specimens have beards much larger than those in the illustration, while in other cases the beards are very short. The flowers of some plants are dark purple, others are deep clear green. This is a very rapid and rank grower, especially on rich, damp land. Isolated plants send out branches which run off quite obliquely, but when crowded they run up straight. The leaves, in good specimens, are half an inch or more in width, and the whole plant often four or more feet in hight. The culms, or stems, are branching at the base. This is very common in waste places, gardens and fields, where it is one of the prominent weeds. Stock are fond of it, as the stems and leaves are succulent and tender. It may be used for soiling, though alfalfa, red clover, rye, orchard grass, Indian corn are doubtless better. This comes from Europe.



PANICUM CRUS-GALLI.—FIG. 146.

LUCERNE.

For the benefit to Rural readers I here give the results of 14 years in the culture, uses and value of this plant.

What it is good for.—The green plant is eaten readily by horses, cattle, sheep, goats, swine and fowls. It is tender, succulent and very valuable for feeding milch cows—greatly increasing the milk and giving a pure article free from any foreign and unpleasant taste or impurity. Cured for hay, it is equal to the best varieties cultivated, and superior to the ordinary crops, insomuch that here, in the mountains, where the wild grasses are considered richer than the tame grasses of the States, the lucerne hay, without grain, is considered equal to feeding the wild hay with grain. In this country when the fields of lucerne are in bloom, the air is resonant with the hum of myriads of bees that steadily gather honey from the tiny blossoms.

The Yield.—After the first year the farmers cut annually four crops and often a fifth—a small crop, perhaps frosted, but excellent for milch cows. A good piece of ground will generally yield two tons to each cutting. Of course, that is over a general average, taking in all grades of land; but eight tons each year to the acre are no unusual crop here. It must, however, be borne in mind that our lucerne fields are well irrigated, receiving at least two waterings for each crop.

Starting and Cultivation.—Experience has taught us here that if the soil be good and smooth, it is best not to plow the ground, but when warm and moist—just nice for corn—sow the seed broadcast—about 15 pounds to the acre—harrow and cross harrow thoroughly, and if too light, roll or *brush* it down. If the ground is plowed, it should, by all means, be rolled. The plants will be up in about eight days, if all is right. As soon as the plants get up high enough to mow, the crop should be cut. This makes the plants *stool* and become more vigorous and strong. When in full bloom, the crop is mature for hay.

Lucerne will stand harder drought than any other cultivated plant. A large plant will put a tap-root down 10 feet or more; and yet no plant pays better interest for proper moisture. This crop does not impoverish the land but seems to draw most of its nourishment from the subsoil and clay beneath the soil. In Utah we consider lucerne the most valuable crop we grow and it is the only hay and feed, or fodder plant we cultivate, and were it not for this, many of our now smiling oases would still be barren desert. We could not progress without lucerne. J. E. Johnson.

Washington Co., Utah.

DOURA, DHOURA OR DORA.

In your issue of December 27th last, you give a picture of what you call Doura. To me it seems more like one of the many varieties of sweet Sorgo. No one would doubt its being of that family, either more or less sweet; but I should not call it Doura. I would sooner think it to be Imphee. Some of these sorts of Sorgo, as you say, are relished exceedingly by stock and the variety you describe is evidently a valuable one for that purpose. But if your readers follow your advice and send to a seedstore for "a small quantity of the seeds of Doura," I think they will get what you call Egyptian Corn. At least that is my experience. As much as 15 or 20 years ago I received a package of seed (from the United States Agricultural Depratment, I think) under the name of Dhoura corn. It was white and identical, no doubt, with what you describe as the Egyptian corn. A few days since I sent to a large seedsman in Philadelphia for white Doura corn, and have received exactly the same thing. One year ago I applied to the Agricultural Department for Doura corn and got the same thing, except that it was *brown*, under the name of Brown Doura. I had liked the white in other years after being well boiled, and wanted it for edible purposes, but found the *brown* unsatisfactory, and hence my application this year for the *white*. It is liked also by many when ground and made into mush and then fried, also for griddle cakes. There is no doubt that in the Eastern countries a very large population subsist largely upon this grain, and it is being introduced very satisfactorily into the western and drier portions of this State, and it endures the dry seasons much better than Indian corn or indeed, almost any other grain. I had hitherto supposed—and do not yet see, any need for changing my opinion—that Doura was a Sorgo with recurved heads, not very sweet, and cultivated only for its seed. It generally does "*send up only a single stalk.*" The variety you pictured is probably a better forage plant, but I should not know under what name to call for it, unless I ordered it from the Rural Office. I would like to try it. W. Beckwith.

Johnson Co., Kansas.

[Remarks.—We did *not* recommend our readers to buy *our* variety of Sorghum of seedsmen indiscriminately; but of *one* firm only which had *supplied us* with the variety which we deem of so much value as a fodder plant. We cautioned our readers, indeed, against buying any of the sorts advertised as Doura, Dora or Dhoura, Brown and White Egyptian Corn, etc., in the expectation of obtaining the particular kind which was raised at the Rural's farm last year and to which we have always alluded.

So far as we have thus far been able to ascertain, this kind of Sorghum will need a variety name. The Rural New-Yorker has contracted with a Southern farmer to raise several acres from seeds which we *know* to be of this particular sort. Unless the engaged crop should fail, it will be placed in our Free Distribution for 1880–'81. The land has been pre-

pared and the seed planted under the superintendence of our editorial correspondent now traveling in the Southern States.—EDS.]

CORN.

IN the discussion of this subject it is very evident that much more than is now known is to be learned about corn, its habits, culture and improvement. Every season develops some very important facts heretofore unknown. Scientific men and many farmers who do not pretend to know much about the physiology of vegetation, are continually discovering something of great value to the corn-grower. He that can grow most corn per acre at the least cost, stands at the head of the many successful competitors.

It is so easily adapted to the latitude of every State and to any locality, that there is no question as to its being the most profitable and useful of all the cereals. The flinty varieties do best in the North, while in the Southern States the soft Dents only can be successfully raised.

It appears that soils, full of alluvial elements —those we call the richest—do not produce the largest yield or the best grain. On the streams in the Southern States the soil has so much alluvial matter in it that too much stover is grown and not enough grain, while the uplands of some of the Middle and Western States, with not half so rich a soil, possess the happy medium of soil and climate, skill and culture which go to make the right proportion of stalk and grain.

According to the report of the Commissioner of Agriculture, Nebraska heads the list of average yields; Vermont, Maine and New Hampshire come next, while Florida, South Carolina and Georgia are last. A difference of 33 bushels per acre between the maximum and minimum States is certainly surprising. I have been satisfied for years that this difference does not arise from soil or climate.

I have in past years visited every Southern State east of the Mississippi, except three, and found the climate and soil in each much better adapted to corn raising than any one of the Eastern States. Alabama, whose average is 12 bushels, has farmers who have raised 206 bushels of corn per acre. South Carolina, too, boasts of a number who have made special yields of over 200 bushels per acre. If by a little science such large yields can be made in those States whose average is so low, there must be room for improvement, for skill and for advancement. PROF. E. A. BLOUNT.

THE COW PEA AS A WEED EXTERMINATOR.

WHEN I came upon the farm, two years ago, like every other novice in farming, I was looking out for "new fields to conquer." Seeing an article in a western agricultural paper upon the Cow-pea, written by a man living in Kentucky, I thought that this would give an opportunity to introduce something new into this part of the country. Owing to various causes of delay, however, I did not get seed until the first of June. I sowed a portion of them broadcast, at the rate of a bushel to the acre; drilled some in rows, and planted some in hills about three feet apart, with the rows one way—soil, a fair silicious loam well seeded with cockle-bur and fox-tail. The peas came up nicely, and bid fair to make a good crop. But, alas for human expectations! the cockle-bur and fox-tail grew also, and swallowed up the peas that were sown broadcast, leaving here and there a solitary one to mourn the loss of its companions. Had I depended wholly upon this method of cultivation, I should have lost my seed; but those planted in rows, which only received two plowings, did better. By the laborious method of hand-picking, (no other would answer, as the cockle-burs were so thick in the rows), I succeeded in saving "right smart" of seed.

Last season, thinking that I would be a "wiseacre" and profit by the experience of the past, still lingering under the impression that the Cow-pea would smother out all kinds of weeds, except the invincible cockle-bur, which it had failed to overcome in an equal "tussle," as soon as I thought all danger of frost was over, I sowed them in the orchard, some thick and some thin, at the rate of from one to two bushels to the acre—the orchard was very weedy, being infested chiefly with Spanish needles.

As before, the peas came up splendidly, and started off as though they intended to have their own way about it on that plot of ground. Here, surely, with the aid of the Cow-pea, I was going to "clean out" that orchard without much trouble. During the next harvest when I sent a hand into the orchard, at odd spells, to cut down the giant weeds, I thought that the Cow-pea might succeed in the South as an eradicator of weeds, but in this latitude —on the line between Iowa and Missouri—it would have to be cultivated as well as corn, or sown upon a clean piece of land.

Although the Cow-pea has not met my high expectations, I intend to give it another trial this season; whether I shall gain anything from past experience, or not, the sequel will show. At least I will have a clean piece of land to experiment on. My peas are mixed —mostly Whip-Poor-Will, which are recommended as the best variety for a Northern climate. W. E. P.

The Herdsman.

STOCK NOTES.

Water for Cows in Pasture.

FOR milch cows it is very necessary that the water for them is pure, otherwise it taints the milk, and from this neither good butter nor cheese can be made. Where there is not abundance of clear running water in yard or pasture, it should be supplied from wells or cisterns. If drunk from standing pools or small ponds, the water is always more or less foul, or so stagnant as to be unpalatable, and at times even unhealthful. In order to obtain a full flow of milk cows must have all the water they will naturally drink at morning, noon and night, otherwise they will not give full messes of milk, nor will it be of so good a quality. But a running stream, more especially when at pasture, where they can go and drink at pleasure, is still better than that drawn from wells for them three times per day, at regular intervals. Necessity, however, often compels the latter course. Some dairymen, in order to increase the flow of milk, stimulate their cows to drink an extra quantity of water, by extra salting their food or stirring a small quantity of bran or meal in it. But this is objectionable, inasmuch as it tends to lessen the richness of the milk. This also fills up the stomach so much as to dilute the gastric juice and thus injure digestion, and more or less of the food is consequently voided whole. If there be a gain in milk, then a loss in food follows by stimulating to an excess of drink.

THE PATRIARCHS OUTDONE IN OREGON.—A herd of nearly 24,000 head of cattle were lately started from Oregon for Montana. It required 120 men, mounted on horses, to do the driving. Provision wagons and outfits required 800 horses to draw them, and for assistant guards and stirring up game on the route 40 dogs were taken into the cavalcade.

A LARGE FOREIGN STOCK-BREEDER.—Earl Dunmore, a very wealthy Scotch nobleman, recently crossed the Atlantic and has gone to Montana with the intention of starting a cattle ranche on a large scale. He designs purchasing several thousand Texas cows and to cross these with the best sort of bulls—Short-horns and Herefords, we presume, although to them he may possibly add some others. We would suggest the Polled Angus of his native country. He intends to become a large shipper of beef to Great Britain.

SIDE-BONES.—As many do not know the meaning of this term as applied to horses, we will explain, for it is not as carefully guarded against as ring-bone, spavin or curb; but it is about equally injurious to the service of the horse, and is apt to be as hereditary. A side-bone is formed by the conversion into bone of the cartilage or gristle, just above and on each side of the hoof. In its natural state it is a smooth, solid, elastic substance, softer than bone. It most often occurs on horses with thin, flat feet, which characterize so many of the larger breeds of Europe, except those bred on the chalky or limestone soils of Normandy, La Perche, and some of the neighboring districts of France. This is why our best American breeders have lately preferred to import their large horses for the formation of their studs from the above districts, rather than from Flanders and Great Britain. The feet of those latter horses are so flat and thin that they are soon used up on hard roads, and especially city pavements, while the former will work on them without injury to old age, if kept properly shod.

ANGORA GOATS.—A superior importation of Angora goats has just been made from Geredeh, Asia Minor, by Col. C. W. Jenks, for the Hon. Richard Peters of Atlanta, Georgia. These goats are of greater size than any heretofore imported, and yield much larger fleeces, usually weighing 8 to 12 pounds. The staple is a fine silky mohair. It will not cost over one-third as much to produce this as raw silk and it will make a kind of goods equal to it in strength, lustre, and fineness. The mountain and hilly climate of our Southern States, is quite like the district of Asia Minor where these goats are bred, and there is no reason why they should not succeed in this country as well as in their own native domain.

MERINO SHEEP-BREEDING IN ENGLAND.—The 13 Merino sheep shipped from Australia to England, for the Duke of Manchester, to form a flock there, have arrived safely. Merino sheep breeding has been tried several times in England during this century, but was soon given up. The climate of the whole United Kingdom is too humid to breed Merinos successfully; they can endure any reasonable amount of severe dry cold, though not a long-continued dampness. But land is too dear in Great Britain to rear sheep merely for their wool—mutton there is the paying thing, and wool only secondary. The mutton breeds of English sheep give far superior flesh to that of the Merino, and the animals themselves, with their fine points and full, round, smooth outline, are such a contrast to the thin, angular, ungainly Merino, that an Englishman only looks upon it with disgust, in comparison with his own handsome native sheep.

TURNIPS FOR MILCH COWS.—In the RURAL of Feb. 21st, page 119, Henry Stewart in writing of "Bitter Cream," says:—"If turnips are fed, I defy any person to escape bitter cream and ill-flavored butter." My experience is quite the reverse of this. I have fed turnips (White French) for three winters to five or six cows giving milk, and no turnip flavor could be detected in the milk or butter. I have never had any bitter cream. My butter brings the highest market price. I have fed about six quarts per day to each cow at milking time.
Vernon, Vt. S. C. A.

A CHICKEN-EATING COW.—One evening as the cows were being driven from the pasture into the barnyard, a little chicken sat peeping in the gateway. As the cows passed through, a yearling heifer, putting down her head, took the little thing up and, giving it a bite or two, swallowed it, and passed on nodding her head and smacking her lips, as it were. We have a horse, too, that seemed to be trying to eat our young pig the other day. Are horses and cows becoming carnivorous? JENNIE WATSON.

PROLIFIC SWINE BREEDING.—Six sows of a fine white English breed, recently produced 90 pigs, which in our opinion, was 42 more than they could well nurse. Eight pigs to a sow is as many as can be properly suckled, and only six may be still better to insure a rapid growth, which is the main thing required for profit from birth to slaughter.

Dairy Husbandry.

COUNTERFEIT BUTTER.

A MORE unblushing and dangerous swindle has not been palmed upon the world for many a year, than the oleomargarine which nobody ever sees under its own brand, but which everybody is in danger of eating under the false name of butter. The American people are known as the greatest butter eaters, consuming a larger amount per capita, than any other people. When capital and apparent respectability combine, and through bogus scientific opinions and editorial advertisements in our large Dailies, seek to impose this counterfeit of butter upon the people, it is time that the agricultural press should come to the rescue of the legitimate dairy product, and stamp this vile counterfeit and those who are knowingly concerned in its sale under an honorable name, with the public condemnation they deserve.

The loss of money in buying the fraudulent article is unimportant compared to the danger to the public health. The examination of this oleomargarine under the microscope clearly proves that it often contains the germs of living organisms, which have survived the temperature (120°) used in its manufacture. These living germs may be of many kinds, trichina being among them. The original French patent for making it, Prof. John Michels asserts, gives directions for using the stomachs of pigs and sheep, so that trichina is likely to be found in it.

The letter of Dr. Dallinger, given in the American Journal of Microscopy, shows that these organisms, even in their fully developed living forms, are not killed by 142 degrees of heat, and that the germs of the whole septic series of organisms require at least 212 to 235 degrees of heat to kill them. Then it is evident that whatever germs this refuse fat and the stomachs of pigs and sheep may contain, are carried through uninjured into oleomargarine butter. And what real doubt can any one have that these materials contain these germs, when some of the best microscopists have declared that they have repeatedly found them? Prof. Michels, of New York, first described them; then Prof. Smith of Cleveland, and since, Prof. Thomas Taylor, Microscopist to the Department of Agriculture, gives his experiments, in the Scientific American. He says when dairy butter is examined, merely oil globules and a few chrystals of salt appear; but when a specimen of oleomargarine is examined in the same way, the field is speckled all over; and in using a power of 250 diameters, animal tissue is seen more or less over the whole field. One specimen was highly charged with animal tissue.

There can be no doubt of the absolute danger in the use of this spurious butter. Its manufacturers well know that if they comply with the laws, and stamp every package plainly with the name "oleomargarine," it will have no value in the market. They now resort to the cheat of compounding with it from 15 to 30 per cent. of creamery butter, and then principally sell it under that name. It is to be hoped that the efforts now making by Boards of Trade and dairymen, will result in compelling these men to drop their false pretenses and sail under their own colors. E. W. S.

THE TRUE PRICE OF MILK.

JONATHAN TALCOT.

LET us take another view of the milk and butter question as presented by Mr. Richard Goodman in the RURAL NEW-YORKER for Feb. 14th, page 104. In the arguments advanced by Mr. Goodman on the subject of furnishing city customers with pure milk and good butter, and the manner of doing it, I should probably not differ much from him; but his reasonings on the cost of making a pound of butter from the stand-point from which most dairy farmers are obliged to look at it, is not correct. Mr. Goodman says: "Now, if milk is worth from six to eight and ten cents a quart, how can the consumer expect to get good butter for 25 to 30 cents a pound, when it takes, on the average, 12 quarts of milk to make a pound of butter, from ordinary cows 12 to 20 quarts of milk are required to make a pound of butter. The milk of some of the thoroughbreds is much richer, and that of the Jersey cow, noted for her special butter-making qualities, is capable of occasionally producing a pound of butter from five quarts but a fair average is about eight quarts. At six cents a quart, such butter would be worth 48 cents at the minimum cost, and, as a matter of fact, good fresh butter cannot be put into the market, except, perhaps, for a short season in the early summer, at less than 50 cents a pound, and give the careful and cleanly farmer a living profit."

The word, *if*, used before milk, is the rock on which Mr. Goodman stumbles, consequently his argument as to the price of butter is valueless,—and just such arguments are used by a great many writers who wish to make a show, or to grind their ax on somebody's grindstone, and have the owner of the grindstone turn it for their benefit, while they are telling him it is for his benefit to do the turning and find the grindstone also, and sometimes it seems they make him believe it. Mr. Goodman's error is in the valuation of the milk. In all candor I would ask Mr. Goodman—can you sell your milk at your farm for six cents a quart, all you can produce the year through? If so, can New England farmers generally do so? Can they sell their milk at their respective farms for three cents a quart during the entire year—all they can produce? If these questions can be answered in the affirmative; then the farmers of New England ought to be the most successful in America.

It seems to me that the true price of milk is what it will net the majority of the dairy farmers at their farms, and the manufacture of cheese and butter is the only way it can be disposed of, that is accessible to all producers of milk, except a favored few who live in the vicinity of cities to which their milk can be carried by railroads and be thus disposed of to better advantage, than by making either cheese or butter, as the majority are compelled to do, in order to dispose of their milk at all. Let us see what milk has netted some of our dairy farmers in Central New York:—Statement of Armstrong Cheese Factory for 1879, commencing April 23d and closing Oct. 31st:—ratio for one pound of cheese 10 21 pounds of milk; value of one pound of milk, six mills 27-hundreths. Statement of Fabery Cheese Factory, commencing April 10th 1879 and closing Nov. 7th, milk for one pound of cheese 10.22 pounds; value of milk per pound, six and a half mills—both of the above statements are signed officially by the respective treasurers. Allowing one pint of milk for a pound, which is a little more, then from these factories the dairymen who supplied the milk, got a fraction over one and a quarter cent for a quart of milk furnished, instead of six cents, the basis of Mr. Goodman's estimate in regard to the value of a pound of butter made from milk, as quoted from the above-named letter to the RURAL NEW-YORKER.

Take another factory that is considered one of the best in its patrons and the person who makes the cheese, and this paid its patrons for 1879 a fraction over seven mills for a pound of milk, which would be about one and a half cent to the quart, which is only a quarter of the price at which Mr. Goodman based his estimate, thus showing conclusively that Mr. Goodman has not based his estimate on the true value of milk as produced by our dairy farmers, therefore his estimate cannot be correct Therefore, if all dairy farmers should make a first-class article of butter and cheese, in seasons like 1879, they would not get for their milk but about one-quarter the price of what Mr. Goodman based his estimates on, and in the best of seasons that may be likely to favor the dairy farmer in the near future, less than one-half of the price that Mr. Goodman puts upon milk per quart, will be likely to be realized by all dairy farmers who are obliged to have their milk manufactured into butter and cheese, even where a first-rate article is made.

Rome, N. Y.

Miscellaneous.

WHAT OTHERS SAY.

THE TAME GRASSES IN KANSAS.

The following paper is from the pen of our occasional correspondent, Professor E. M. Shelton, of the Kansas State Agricultural College. It is taken from The Industrialist, a college record, which is edited by Professor Shelton. Alluding to this article, Professor Beal says: "It is very valuable and most or all of it well worth printing. There is nothing equal to it for the West, and you cannot afford to omit it."

WHY WE NEED THE TAME GRASSES.—To most of us, our needs in this regard are painfully apparent; and I need not enlarge upon this topic. Our wild grasses, valuable as they are, notoriously cannot endure close cropping. Even under moderate pasturing, they rapidly fail, giving place to coarse and worthless weeds. Again, these wild grasses are among the very latest of our plants to appear in the spring; and the lightest touch of frost in the fall, robs them of all nutritive qualities. It is no exaggeration to say that the tame grasses will redoce our present feeding season at least one-third. But, pre-eminently, we need the tame grasses because they are indispensable to any improved system of farming which looks to maintaining the fertility of the soil, while exacting the utmost from it. In no way can our worn soils be replenished so cheaply as by turning under with the plow the great accumulation of vegetable mold, roots, and straw which constitute the turf of an old pasture field.

WHAT GRASSES SHALL BE GROWN?—We have to classify the grasses into two principal groups, according as they are valuable for pasture or mowing. Occasionally, as in alfalfa and the clovers generally, sorts may be found which are equally good for both purposes; but, generally, those sorts which are valuable for grazing have but little value when brought under the scythe.

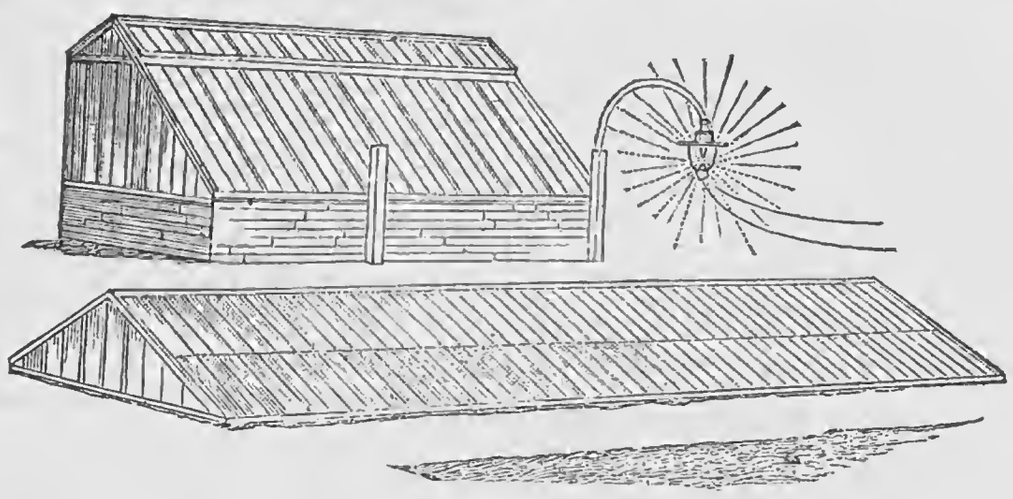
For pasture, I have no hesitation in recommending the following sorts, placing them in the order of their importance: orchard-grass, alfalfa, red clover, perennial rye grass (English blue-grass), Kentucky blue-grass. For mowing purposes, our experience has shown, very steadily, that alfalfa, red clover, perennial rye-grass and timothy are the best. So far as the matter of withstanding the effects of drought is concerned, these sorts will rank, with us, in about the following order: alfalfa, orchard-grass, Kentucky blue-grass, red clover, and timothy. With perennial rye-grass our experience has not been sufficient to warrant me in making any statement under this head.

CHARACTER OF THE SOIL, AND ITS PREPARATION.—In our experience, the best results have been obtained with all the sorts of tame grasses upon a fertile clay loam, resting on a permeable clay subsoil. But, let it be remembered, land cannot be too rich or too highly manured for the grasses. Indeed, we have found that not only are the largest yields obtained upon such fertile lands, but the influences of drought and insect depredations are greatly lessened. Of course, comparatively poor lands, in Kansas as elsewhere, will grow grass; but poor lands produce poor crops everywhere. Better far, commence the growth of the tame species of grass before the land has become impoverished by injudicious cropping.

But, whatever may be the character of the soil, prepare the land as well and thoroughly, by plowing and harrowing, as for any grain crop. This is a rule with scarcely an exception; and its violation in various ways explains a large proportion of the failures that have attended the attempted cultivation of tame grasses in Kansas. The question is asked me many times every year, "Why may I not scatter the seed upon the sod, as is often successfully done in the East?" This may be done; but the practice, so far as my observation has gone, has resulted in almost uniform failure. Where the prairie sod has been largely destroyed by the tramping of cattle, we have known blue-grass to succeed partially by this method; but even in this case, a better sod would have been obtained in less time by thoroughly subduing the land by two or three years of cropping, before applying the grass seed.

DO NOT SEED WITH ANOTHER CROP.—Oats are often recommended as an excellent crop with which to sow grass seed. The argument is, that the oats will shade and protect the young grass. But grass does not need shade, when sown in proper season: it needs the sun, and especially it needs moisture; and this the oat plants are continually taking from the soil, thus robbing the young grass plants from the start. I am aware that, upon favorable seasons, considerable success is often obtained by seeding the grasses with another crop. But upon these favorable seasons, a better and more vigorous start will be obtained without the rivalry of vigorous grains; and upon dry seasons a failure of the grass is almost certain, when seeded with a grain crop.

THE TIME TO SOW GRASS SEEDS is, I believe, without exception of any kind, in the spring; and of most of the grasses it may be said, the earlier they are sown after the frost has left the ground, the better. In a few instances and where the winter following has proved warm and open, we have had good success with timothy and clover sowed in the fall; but the result of sowing orchard-grass, alfalfa, and blue-grass, in the fall, has been almost invariably disastrous. With all kinds of grasses, we have obtained the best results when the seeding has been done in the spring. In looking over a field seeded last fall to a mixture of orchard-grass, clover and blue-grass, we find that the native grasshoppers have consumed and utterly destroyed a strip a rod in width, running entirely around the field; and the freezing and thawing of the winter have wrought sad havoc with the remainder. On the other hand, when the seeding is done late in the spring, the young and tender plants are consumed by the sun as fast as they appear above the ground. Seed sown during the last week of March, and any time during April, will rarely fail to germinate and make a vigorous growth. We have sown both alfalfa and orchard-grass during the early part of May, with excellent results.



FORCING PLANTS BY ELECTRIC LIGHT.—FIG. 147.

ALFALFA, OR LUCERNE, has been cultivated as a forage crop from the earliest period of history. It was well known to the ancient Romans; and, time out of mind, it has been a favorite fodder plant with the inhabitants of Central and Southern Europe. The early settlers of South American States—notably Chili—carried the seeds of this plant to their new homes, where it has been grown with great success ever since. From Chili its cultivation has rapidly extended over California and our western coast, whence most of our knowledge of it has been derived. The effect of the dry climates of South America and California upon the habit of the plant, has been quite remarkable. Alfalfa is more hardy, takes on a more luxuriant growth, and endures drought much better than its near relative, lucerne. For this reason, it is clearly to the interest of every grower of alfalfa to use seed of California origin.

In regard to the value of alfalfa for Kansas, I have no hesitation in saying that, all things considered, it is our most valuable clover, especially for the western and southwestern sections of the State. Nevertheless, a large proportion of those who undertake to grow alfalfa will fail in the first attempt. Let me emphasize two or three of the matters about which most of these failures cluster. Alfalfa must have old, rich and well-drained land to begin with; and the freer this is from weeds, the better. Prepare the ground thoroughly, by plowing and harrowing. Sow not less than twenty pounds of seed per acre; and sow this about the middle of April: harrow in lightly, following with the roller, if possible. Do not be discouraged if the plants make a feeble growth during the first season, as they always do. Do not pasture or mow during this first and critical season. The mower should occasionally be run over the ground, high enough to miss the alfalfa and cut off the tops of the weeds. After this first season, alfalfa will take care of itself and all the weeds within its reach. Alfalfa is perennial, perhaps eternal; at all events it will outlive the "oldest inhabitant." It makes the most pasturage for neat stock, and the best "hog pastures." It cuts the most hay; we cut four large crops from the same ground last season. And these briefly, are my reasons for believing in alfalfa.

ORCHARD-GRASS has proved one of the very best and safest of all the pasture grasses that we have tried. It is but an indifferent hay plant, yielding a light crop of woody, fibrous fodder. Upon very rich land, large crops of hay are claimed to have been secured; but this result we have never obtained, and the hay has proved with us scarcely equal to that cut from the prairie. But, in grazing, its valuable qualities soon become apparent to the farmer. I feel confident that it will yield fully twice the feed that can be obtained from the same area of blue-grass or timothy, and, in nutritive qualities, it is certainly greatly superior to blue-grass. It is consumed with great relish by stock of all kinds, especially if the grass has been cropped short. It seems to do equally well upon heavy clay and sandy soils; and any rich and well-drained soil seems suited to it. It germinates about as easily as oats; and, with good seed, no difficulty is experienced in getting a "stand" that will endure moderate cropping the first fall after seeding. As might be inferred from its common name, it does best when moderately shaded; and yet there are few grasses that will so well endure the prolonged sunshine of our dry seasons. For these reasons, we feel safer in recommending this grass to the farmers of central Kansas, for the purposes of pasture, than any other sort. It should, however, be remembered that orchard-grass will not make a sod, as blue-grass does. It always grows bunchy; and, to counteract this tendency, seed should be sown with a liberal hand. Not less than one and a half bushel of seed should be sown per acre; and two bushels would perhaps be better. We have usually sown a liberal sprinkling of Kentucky blue-grass seed with orchard-grass; but, almost invariably, it has been completely smothered by the orchard-grass. We have found that red clover does excellently with this grass, and aids in furnishing that variety of food so agreeable to the taste of animals.

Orchard-grass will endure late seeding better, perhaps, than any other sort; but this operation ought not to be delayed much beyond the middle of April.

PERENNIAL RYE-GRASS, OR ENGLISH BLUE GRASS.—In the eastern and southeastern part of the State, this old English favorite has given great satisfaction; and its cultivation in these parts is rapidly extending. In some respects, this sort is superior to orchard-grass, as it seems equally adapted for pasturing and mowing. Moreover, the seed grains are large; and a stand is as easily obtained as with oats. We are inclined to the opinion that this sort is especially valuable for our rich bottom lands, over a large part of the central and eastern portions of the State. But it is worth while to remember that perennial rye-grass yields a woody and comparatively innutritious feed; and it is peculiarly liable to ergot, a fact which our graziers will appreciate. I have frequently noticed this parasite in great abundance upon the rye-grass grown upon the College farm. Sow not less than two bushels of seed per acre, upon land that has been well and thoroughly prepared.

RED CLOVER the most generally valuable of all clovers and grasses, needs no particular mention here. In 1874 and '75, two exceptionally dry seasons, it failed almost entirely here, giving neither pasture nor hay. But, during the favorable seasons which have since prevailed, it has flourished abundantly; and has yielded more—both of hay and pasture—than is generally obtained in the East. Last year we cut two excellent crops of hay and a crop of seed from the same ground. Red clover in this State has one interesting peculiarity that is worth mentioning—when land is once seeded, it never "runs out," as is the case in the Eastern States, but thickens and spreads continually, by self-seeding. Red clover is worth a trial anywhere in the State; but, in very dry seasons, it lacks the "staying" qualities so remarkable in alfalfa.

KENTUCKY BLUE-GRASS can be grown almost anywhere in the settled portions of the State. We have never failed to secure a good stand, and ultimately a good sod—even during such very dry seasons as 1875—when good seed was sown upon well-prepared land and at the proper season, which is early in the spring. However, our experience with this grass—a very extended one, by the way—has convinced us that, for all useful purposes except lawns, in central and western Kansas this is one of the most worthless of the tame grasses. It starts early in the season, and for a short time yields a small amount of quite inferior feed; but in May it ripens its seed, the grass becomes brown, dry and fibrous, and in this dormant condition it remains until fall, and often until the following spring. We have invariably found that, in a field containing other sorts, cattle will not touch blue-grass until all these others are consumed, and starvation compels them to resort to the despised blue-grass.

We can easily see that this grass possesses great value for a region like Illinois, and Kentucky, where winter rains abound, enabling it to make a slow and continuous growth; but the Kansas winter is generally our driest season, and for this reason we doubt much if this old favorite sort has any place in our agriculture. To obtain a good stand quickly, blue-grass seed should be sown in the early spring; and, in amount, not less than three bushels per acre of ground.

TIMOTHY I have but little to say of; believing that, over a large portion of the State, it will not prove generally valuable. We have grown large crops, and I have seen many fine stands west of this point; still it suffers more from drought than any other sort that we have tried, and it rarely survives the ravages of the grasshopper.

IN TIMES of severe drought all these sorts, with the single exception of alfalfa, will fail to yield any crop worth the name. Most of those that have been mentioned, cannot be seriously injured by an ordinary dry season; and, on the return of rain, these will start with undiminished vigor.

It is worth remembering, too, in conclusion that our much-despised prairie grasses possess many valuable qualities, which entitle them to the grateful recognition of the husbandman. No known species of grass is better adapted to withstand the effects of drought; and I suggest that any one possessing a good field of prairie grass ought to take all pains to secure it against injury, both for its intrinsic value and as a precaution against a possibly dry season.

THE ELECTRIC LIGHT FOR PLANTS.—We have several times alluded to the experiments of Dr. Siemens regarding the use of the electric light for forcing. Dr. Siemens has furnished the Gardeners' Chronicle of London with particulars of the experiments as far as he has gone, and from that journal our illustration is reproduced. The engraving will serve to show the plan of arrangement. The light has been used in the interior of one house, and has also been placed on the outside of a melon-house between it and a strawberry-pit, as shown in the figure. The house within which the lamp was placed is a small, oblong conservatory, some 24 feet by 16 feet. The lamp was placed at a hight of about eight feet from the floor. In this house the plants nearest to the light were accelerated in their growth by some ten to fourteen days, and in some cases the leaves, as of a banana, were scorched by the rays. The lamp was used at night in this house for some three weeks, and in it were grown the Arums and Roses exhibited at the Royal Society and at the Royal Horticultural Society. Near to this house are situated the melon-house and the strawberry-pit shown in our sketch (fig. 147). Two posts will be observed, the lamp having been suspended, first on the one, then on the other, in such a way that the light fell on one end of the melon-house and then on the other end, the strawberry-pit being lighted at correspondingly different parts of its length in the same manner.

MEAT FROM AUSTRALIA.—The direct result, says the Mark Lane Express, of the successful experiment in connection with the Strathleven's cargo of foreign meat from Australia, is a proposal on the part of Messrs. McIlwraith, McEacharn and Co., of 34, Leadenhall Street, the importers, to form a limited-liability company to develop and carry on the traffic. It is to be called "The Australian Fresh Meat Company (Limited)," and the capital required is £150,000 in £10 shares, the whole of which are now offered for subscription. The prospectus states that "at the present time meat (of the quality of that sent in the Strathleven) can be purchased at 1½d. per lb. at the Australian ports of shipment," and that "an ample supply can be relied upon at an average cost not exceeding 2d. per lb." This estimate appears to be a very safe one, for beef especially is now a glut in the Australian market at 1d. per lb. wholesale, according to the Queensland and New South Wales Press.

NEW COLORS FROM THE RED CABBAGE.—Cauline is a new coloring substance prepared from the leaves of red cabbage, by infusing them for 24 hours in boiling water and evaporating. The color is violet blue. By adding four per cent. of baryta a pale green is obtained; this is baryta-cauline. Chloro-cauline, a greenish blue, is made by adding 20 per cent. of anhydrous chloride of calcium; by the addition of one per cent. of baryta and 20 per cent. of chloride of manganese, a bronze color is produced; eight per cent. chloride of zinc and five per cent. of soda yield an ultramarine blue color; and 20 per cent. of proto-chloride of tin gives a violet color.—Druggists' Circular.

Everywhere.

EUROPEAN CORRESPONDENCE.

PARIS, France, April 12, 1880.

JUST a year ago I much enjoyed my rambles through the various beautifully laid out parks of this magnificent city, admiring, at this time of the year, the remarkable beauty and deep green-tinted foliage of the many varieties of Rhododendrons, Holly, Laurel, Aucubas and conifers, adorning the landscape. But, alas! how disappointed when during the quiet hours of this beautiful morning, I again paid my visit to these well-known promenades. It is true, the stately Elms, Maples, Plane Trees, Chestnuts and other deciduous trees greeted me as of old, with their delicately tinted, virgin foliage, but the glory and pride, producing the wonderful effects of these parks by sun and gas light, have, at least for the time being, departed. All the large and massive groups of the beautiful Rhododendrons were destroyed by the severe cold during the past winter; no foliage or flower buds grace the stems, and in all probability nothing will save the plants but the most severe cutting back. The Laurels and Aucubas, the chief evergreen decorative plants here in Parisian parks, have already been cut down to the very roots. The Holly will have to share the same fate. All the magnificent specimens of the Magnolia grandiflora, of which there were so many in the grounds of the Champs d'Elysee, are dead—so are all the large and beautiful specimens of the Wellingtonia gigantea, Cedrus deodorus, Cryptomeria Japonica, Araucarias and many of the rarest and finest conifers.

In the Jardin de Tuileries nearly all the old, large and fine-headed standard Roses have died and must be replaced. The few evergreens are dead. In Parc du Monceau, the most beautiful in the city of Paris, all the fine and large specimens of the rarer conifers are dead, all the Magnolias grandiflora, several groups, containing over a hundred elegant specimens from 15 to 20 feet in hight, have died. The Laurus prunifolia, the various varieties of Hederas which adorned the magnificent entrance gates and the iron railings inclosing the park, have also died down to the roots. The same fate has befallen all the city parks and ornamental grounds. It will take years and millions of francs to restore the beauty and glory of the parks in this city, destroyed during the past severe cold winter.

The floral establishments exhibit just now magnificent collections of Azaleas and Rhododendrons covered with a mass of flowers of the most brilliant colors, from the purest white to the most fiery red and dazzling crimson. The Remontants and Bourbon Roses are also very fine. Of cut flowers, the Lily of the Valley and the deep-blue, sweet-scented Violet predominate. The streets are abundantly supplied with thousands of pretty flower-girls offering bouquets of those fragrant Violets at from two to ten cents each, varying in size from one to eight inches in diameter and containing from 15 to over 100 large, well developed flowers each. I suppose they would cost at least ten times as much in New York. Fine bouquets of Rose buds, artistically arranged and interwoven with delicate sprays of green, sell for from two francs up to 25 each, according to size. The markets are well supplied with early vegetables, such as lettuce, radishes, endive, cucumbers, asparagus, tomatoes, new potatoes, etc. W. R. BERGHOLZ.

RURAL SPECIAL REPORTS.

ILLINOIS, Baileyville, Ogle Co., April 20.—The first two weeks of this month were favorable, and during that time most of the spring wheat, oats and barley, were sown. There was a heavy rain on the night of the 15th; then it got cold and snowed a little on the 16th. Another severe storm—wind, lightning, thunder, rain and hail—set in on Sunday afternoon, 18th, doing considerable damage to roads, bridges, fences, etc. Cold, windy and snowy yesterday, froze at night; fair this morning—thermometer, 32°. This cold storm has injured tender plants, and has checked gardening and farm work. Some fear it has injured the fruit, but I think not materially here, as the buds were not far enough advanced. A large portion of the winter wheat was so badly frozen out in March that it has been plowed up, and the ground seeded to other crops, but it did not all winter-kill, as some fields have a promising appearance—that which was drilled in, is better in general than what was sown broadcast. Spring wheat that was sown early is up and looks well. The prices of wheat, corn and oats, etc., are lower than during the past winter, and farmers that have any to sell feel disappointed. W. B. D.

KANSAS, Iola, Allen Co., April 19.—We have had very high winds for several days and the ground is extremely dry, and needs rain very much. The prospects for fruit so far are favorable. There is a heavy immigration pouring into this county, and among us there is but little sickness. H. M. S.

MINN., Howard Lake, Wright Co., April 19.—Farmers are resting to-day, after having put in what wheat they could during the thaw of last week. This is the third cold spell since April set in. We had beautiful weather during a large portion of March, and some gardeners would uncover the shrubs and Grape-vines against my advice—probably, few Roses or Grapes will appear. Alarmed last month at the report that all fruit trees were killed, I hastened out to make an examination, and found our own apparently all right, as well as some of the neighbors'; while the trees of one or two are positively killed; that is, all of the standard varieties. Our Transcendent Crab, and some other varieties, we suppose, will stand as long as the Oak does. Early Richmond Cherries have delighted us by bearing a few cherries for two years, but are now dead from the unusually cold weather of last winter. Sorry to have to make this statement, as many were hopeful that we could raise Cherries in this region. Strawberries, Raspberries and Grapes are generally so abundantly grown that we ought to be reconciled to the loss of Cherries, yet we are so greedy and ambitious that we wish to raise or cultivate successfully all our neighbors have. Fall wheat is all killed in this neighborhood, so far as heard from, as the snow went off before some severe freezings. But little effort has been made to raise fall wheat in previous years, farmers generally taking it for granted that they could not do so. S. A. M.

OHIO, Cardington, Morrow Co., April 27.—April has so far been more stormy than for years. On the 23, 24, 25 of this month we had heavy thunder showers. Streams are overflowing. To-day was quite stormy, with some rain and sleet. Feed is scarce—hay, $10@15 per ton; wheat, $1 10; oats, 32 cts.; corn, 42 cts.; rye, 60 cts.; butter, 15 cts.; eggs, 8 cts.; potatoes, 35 cts. Plums, Peaches, Cherries and Apples are blossoming. Prospects for fruit of all kinds are good. Our wheat looks splendid—better than for years, and the acreage has been a third more. J. G. G.

OREGON, Long Tom, Lane Co., April 12.—The culture of wheat here has been very successful, the berry being unusually large and plump, unsurpassed, I believe, in any country. Add to this the fact that it is the chief staple here, and you can form some idea how disastrous the failure of this crop would be. It had long been our motto that "Oregon never fails." Last spring was a very wet one, and wheat grew rank, and visions of full granaries and good prices gladdened the heart of the tired farmer. Either the excess of dampness, or the extreme heat that followed it, or both causes combined, produced rust; but it was not until nearly harvest that it began to be whispered around that rust had struck the wheat. Fall wheat was not affected nor the earlier-sown spring wheat. It would be impossible in so short a space as this letter, to tell you half the disasters resulting from this failure of the crop here. The farmer, however, nothing daunted, strives to remedy the evil, and starts the plow still earlier, and much fall grain was sown. The winter has been rather unfavorable for the early sowing; cold rains and hard frosts, gave it a yellow, sickly look; but the last few days of warm sunshine have improved its appearance, and hope is again revived that the calamity of last year will not be repeated. The prospects for fruit are good. Apples have never failed here yet; they are of good size and fine flavor. Pears do well, and Plums are unsurpassed anywhere. While attention is paid in some places to the cultivation of Ferns, whole fields are covered with them here, and it is quite an object to get rid of them. E. B. B.

OREGON, Tangent, Linn Co., April 14.—There has been quite a demand for horses and men in this Wallamette Valley lately to go to work on the North Pacific railroad. The Company is pushing the work with vigor, and we live in hopes of being connected with the United States one of these fine days. Wheat was badly rusted last summer, but we are going to try it again to see if we won't have better luck next time. We depend too much on the wheat crop to bring money into our country; if we get low prices and poor crops, we are all "hard up"—it is not a good state of affairs. I feel greatly interested in reports of the New Amber sugar cane; if we can only grow it here with success, it will help us farmers a great deal and make us more independent, and if we could grow our own tea, it would stop another of the big leaks. It is not what a nation or a person earns, it is what either saves that makes it or him wealthy. R. L. S.

OREGON, Goshen, Lane Co., April 15.—Fall-sown wheat is good; very little damage from the frost; none from the Hessian fly or from disease, the former never having been seen in Oregon. The prospect is good for a full average yield per acre on twice the acreage of any former year. Our principal crop has been spring wheat; but the prevalence of rust on it for the last two years caused farmers to sow the winter varieties largely last fall. A large acreage of spring wheat also has been sown. The cold weather in March made wheat slow in coming up. W. R. D.

WASH. TER., Walla Walla, Walla Walla Co., April 14.—From the time of the first settlement of this Territory to the present day, embracing a period of 25 years, there has not been a failure of the wheat crop of Washington Territory. No insects have ever put in an appearance to harm it. No diseases of the wheat crop are known in the Territory. It is probably true that in some locations, where the soil is a heavy, clay loam, injury from frost sometimes has occurred, but such injury has been slight and does not often happen. In the poorest seasons known here the wheat crop has averaged 25 bushels per acre and upwards. Fall wheat looks promising, and farmers are busily engaged putting in the spring crop. The season is unusually late, but great confidence is felt that there will be a bountiful harvest. The acreage is increasing rapidly from year to year. This will exceed any previous year in the acreage of the crop. C. S.

The Querist.

ANSWERS TO CORRESPONDENTS.

Chicken Cholera.

A Subscriber, Burlington, Kans., asks for some remedy for chicken cholera. He has lost 100 fowls in the last few months by the disease, and is beginning to think he had better clear away the remainder and begin anew.

ANS.—There is a great number of "sure cures" for this malady, although, in spite of them all, fowls are dying of it every day, often, doubtless because the owner has no idea of what sort of treatment to give the affected birds. From a large number of "cures" which correspondents of the RURAL have mentioned in the last few years, as having proved thoroughly effective in their own hands, we cull a few of the best:—Make a mixture of two ounces each of red pepper, alum, rosin and flowers of sulphur, and put it in the fowls' food in proportion of one tablespoonful to three pints of scalded meal. In severe cases give one-third of a spoonful in a meal pellet, once a day, to each fowl, and put a small lump of alum in the drinking-water. A Kansas correspondent says he has cured fowls in the last stage of disease, with the above mixture.

Our correspondent, Mr. H. Hales, places the ailing birds in boxes or clean straw and cuts away such feathers as have become soiled by their evacuations, and as a means of sustaining life, feeds them twice a day with oatmeal gruel, into which is put some finely-chopped rue. This, of course, has to be poured down the throats of the sick birds. In addition, he sprinkles carbolic powder upon the straw in the boxes where the fowls are placed, dusts some into their feathers and gives them a teaspoonful or two of water slightly impregnated with carbolic acid, which can be obtained of any druggist. The ailing fowls are kept apart from those in health, and after the administration of this remedy they recover rapidly. He treated two or three dozen in this way and thinks he would have lost all of them had they not been so treated.

A lady correspondent says she fed bran mash, in which was a liberal dose of the common garden pepper—feeding every other day for two weeks, and had no more loss from chicken cholera. She says, "Whenever I see a chicken appear droopy, I give it a dose of pepper, and all is well."

Another writer says:—"To one gallon of sour milk add a tablespoonful of alum, set it in shallow vessels where the chickens can drink as often as they choose. We have used it three years and none of our chickens die of cholera when we attend to it in time."

Another cured her chickens of cholera by taking a lump of alum as large as a hen's egg and dissolving it in a half gallon of water. This she thickened with corn meal and gave it to her fowls three times a day.

Rice Corn.

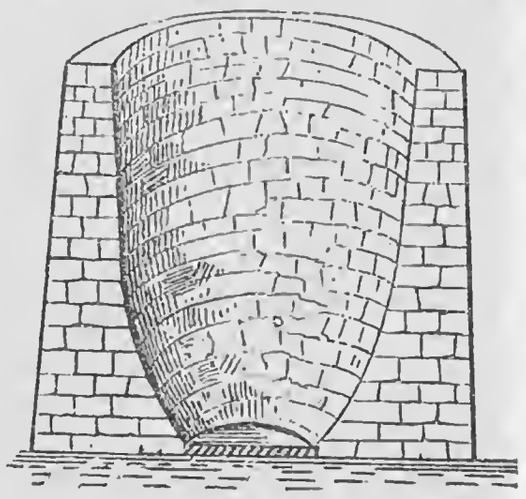
J. C. C., South Gilboa, N. Y., asks, 1, for some information about Rice or Egyptian corn; 2, where can the seed be bought, and, 4, at what price.

ANS.—This supposed-to-be-new cereal is variously called Pampas rice, Rice corn or Egyptian corn, and is thought to have been brought to the United States by the Mennonites, who lately came from southern Russia, and settled in western Kansas and elsewhere in the West. The kernels grow in a tuft like that which crowns sorghum. Each grain is a trifle smaller and rounder than a kernel of wheat, and is inclosed in a "shuck." The meal is not unlike that of Indian corn, and in color is intermediate between that of the white and yellow sorts. The grain can be eaten ground into flour or cracked like wheat, or used generally like any other cereal. A chemical analysis shows that its percentage of starch, fat, dextrine and sugar, which produce heat and fat in the animal organization, compares favorably with that of Indian corn, wheat, rye, and oats; and in its contents of flesh-forming albuminoids it surpasses all Indian corns, and ranks with wheat, rye and oats. It has a very small percentage of cellulose, or nearly non-nutritious woody fiber. The stalk, it is claimed, makes as good fodder as corn does, and a few acres will furnish a family with fuel for the winter in the Western prairies—a consideration of the first importance in that nearly treeless country. According to the Kansas State Board of Agriculture it resists drought in a marvelous manner. Moreover, it is claimed to be worm and frost-proof and to yield, even under very unfavorable conditions, as much as sixty 60-pound bushels per acre. According to the brief notices of it that have appeared in our "Everywhere" from time to time, and the lengthy report made by the Kansas State Board of Agriculture, no crop grown in the vast prairie regions of the West, subject to severe droughts and scorching winds from the Llano Estocado and the South generally, is so rich in fair promises for the farmer. 2 and 3, For seeds and prices write to the Plant Seed Company St. Louis, Mo.

How to Build a Stone Cistern.

M. B., Smithville, Ont., Can., being about to build a large stone cistern above ground so that the water can be drawn off in pipes at the bottom, asks what is the strongest shape, the best means of preserving strength to resist the pressure of the water, and whether the pipes and faucets would be liable to get out of repair.

ANS.—A stone cistern may be built as follows:—The shape which gives the most strength is an oval, and the walls must be thick at the bottom, gradually decreasing toward the top. This will give a cylindrical, or a truncated-cone shape on the outside, as shown in the engraving.



SECTION OF STONE CISTERN.—FIG. 148.

The stone must be laid in water-lime cement consisting of one part of Rosendale cement, and three parts of sharp, clean sand. When the wall is finished, the inside should be smoothly plastered (bottom included) with a coating of cement, without sand, at least half an inch thick, if the cistern is a large one. To make accurate calculations as to the strength of the wall, the size and depth of the cistern should be known. If the pipes are well laid they should not get out of repair in 50 years, if carefully used and laid below reach of frost.

Early Settlers in the United States.

W. N. R., Hubbardsville, N. Y., asks, 1, is there any book that gives the names of the immigrants that arrived in this country between 1620 and 1635, and where can it be found; 2, was Roger Williams a married man; and if so, did he leave any children.

ANS.—We don't know of any such book; but it is not unlikely that many of them could be discovered by a diligent search in the old archives of the various settlements made in that period of 15 years. These include the Plymouth Colony founded by the Pilgrim Fathers who left England in the Mayflower, Sept. 6, 1620; the Massachusetts Bay Colony, in which Endicott founded Salem in 1628, and which received a reinforcement of 400 newcomers in 1629, and an additional 700 the year following, when Boston was settled. In 1623 settlements were also made at Portsmouth and Dover, New Hampshire; another at Monhegan, Maine, in 1622, and another at Saco, in the same State about the same time, or at the mouth of the Pemaquid in 1626, according to Bancroft. Although Connecticut was settled in 1635, still as it was by emigrants from Massachusetts, they do not count in this connection. It would be necessary, however, to hunt up the archives of the Dutch settlements on Manhattan Island (New York City) as well as at Fort Orange (Albany), at both of which places the first permanent settlements were made in 1623, and both of which received considerable additions before 1635. All things considered, it is more than doubtful whether years of research would enable our friend to learn the names of all the immigrants to the English Colonies in this country during the above 15 years, to say nothing of the Spanish settlers in Florida, which is a part of this country—even in the most limited meaning of the term. 2, Roger Williams was certainly married, as we are told that he arrived at Boston on Feb. 5, 1631, accompanied by his wife, Mary, but whether he left any children we do not know.

Growing Peanuts.

E. W. K. Westfield, N. Y., wants to know how to raise peanuts in western New York, what kind of seed to get, what soil they require, and just how to go to work.

ANS.—In the first place you cannot raise peanuts successfully in western New York. The peanut is a Southern product and it requires a Southern sun to bring it to such perfection that it can be grown with profit. If, however, you are determined to try the cultivation of peanuts, begin on a small scale. Select a rich sandy loam, manure with well rotted stable manure, if a fertilizer should be needed, and in addition apply shell lime to the patch at the rate of 40 or 50 bushels per acre. There are two varieties of the nut recognized—the Virginia and the Carolina; the Virginia will probably give best satisfaction. Mark out rows each way about three feet apart and at each intersection plant two sound nuts an inch and a half deep. The planting should not take place before near the end of May or in the beginning of June; if planted too early the nuts are liable to rot in the ground. Germination will be facilitated if the shells are cracked or entirely removed before planting, but the kernels must not be bruised in the cracking. Although the peanut is a fruit, the result of a flower, it is developed under ground, the pods in growing being pushed into the surface soil. This peculiar habit necessitates that the top soil should be loose and mellow. Cultivate frequently and thoroughly during the season and let the crop continue to grow until killed by the first frosts. Then the nuts should be dug, dried and picked, when they will be ready for market. The yield ranges in the South from 20 to 100 bushels per acre, and the price from $1 to $2.50 per bushel.

Postage Stamps.

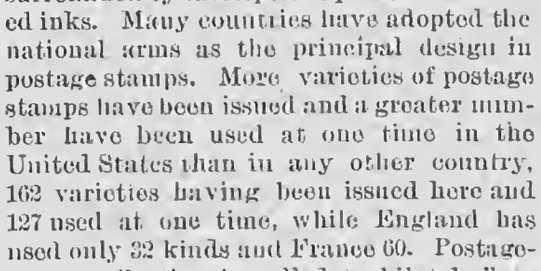
E. B. B., Long Tom, Oregon, asks the date of the first introduction of postage stamps and an account of their changes.

ANS.—The system of prepaying postage by means of small adhesive labels, to be sold to the public and received by the post-office as evidence of payment when attached to letters, was first advocated by Rowland Hill in 1837, and was adopted by the British Post-Office in 1840, the stamps being first used on May 6 of that year. The designs on the stamp have varied greatly with the time at which they were issued and the nations who have used them. The first adhesive stamp issued by Great Britain was the profile of the Queen, with the word postage above and the value below it; but this was objected to on account of the blackening—in cancellation—of the sovereign's portrait. Brazil, the second country to adopt the system, used first the simple figure of value and afterwards a portrait of the Emperor. The various German States seem to prefer numerals of value surrounded by inscriptions printed in colored inks. Many countries have adopted the national arms as the principal design in postage stamps. More varieties of postage stamps have been issued and a greater number have been used at one time in the United States than in any other country, 162 varieties having been issued here and 127 used at one time, while England has used only 32 kinds and France 60. Postage-stamp collecting is called "philately," on which several articles appeared in the RURAL about six months ago.

Marking Chickens.

D. D. C., Mt. Union, Ia., asks for some good plan for so marking young chickens that they can be distinguished from one's neighbors' of the same breed.

ANS.—Chickens can be marked by a very simple method, and in quite a number of different ways, by punching a hole in the web of the foot between the toes, by means of a small steel spring punch such as is used by boot-makers. The accompanying cut explains the matter. One hole may be between the middle and outside toes, or between the inside and middle toes, or in both these places, in either fool or in both; or two holes can be made instead of one in either or all of these places, so that the number of changes that can be made in marking according to this simple way is quite large. Of course, a record should be kept of the markings. The punch should have a sharp edge, and the marking may be done as soon as the chicks are hatched; but it is better to wait until they are a few weeks old; for otherwise it may be necessary to repeat the operation when they grow larger.



CHICKENS' FEET MARKED.—FIG. 149.

Eradicating Stumps.

H. B. Greenville, S. C., asks for the cheapest and best way of getting rid of stumps in a field.

ANS.—The cheapest and most effective way is to blast them out with cartridges of giant powder. This explosive is a preparation of nitroglycerine, many times as powerful as common powder, and its great force, being very sudden in its action, tears the stumps to fragments so that but little, if any, after-cutting is required to dispose of them. The giant powder is put up in cartridges about 10 inches long by 1 1-2 in diameter, and these, being of the consistence of cheese, can be cut into pieces, of the size required, with a knife. A piece two inches long is sufficient to throw out a good-sized stump. A hole is punched under the stump with a crow-bar; the explosive, with the proper fuse and fulminating cap attached, is put in the hole, water is poured in as tamping, and the fuse is fired. The explosion throws the stump out in several pieces, leaving the hole to be filled up afterwards. Experts have taken out 100 stumps in a day in this manner.

Heaves—Broken Wind—in Horses.

S. F. B., Bethel, Oregon, has a seven-year-old horse that has had little or no work most of the time, and never any heavy work, while he is well fed in winter on oats, timothy hay, carrots, and occasionally straw and bran for a change; a year ago, on driving him at a fair gait, it was noticed that he breathed loudly; no treatment was given, and now he has grown worse. At ordinary gaits this sort of breathing does not injure him, but brisk driving or heavy pulling necessitates frequent short halts, after which he goes on as before. A little excitement causes him to breathe still louder, and our friend asks, 1, what ails him; 2, the name of a good work on the treatment of ordinary diseases in horses and other domesticated animals.

ANS.—Keeping horses on feed of a bulky character, distending the abdominal cavity at the expense of the thoracic, will cause, on inspiration, a rupture of the wall of the air cells of the lungs from over-distention. As a certain amount of air is taken into the lungs at every inspiration, if from any cause a part of the lung will not dilate, then other parts are over-distended, hence rupture. There is no certain cure; but horses with this infirmity will, if fed properly, do a great deal of service. As treatment, feed on dry grain, carrots, turnips, and a little hay at night—very little water. Do not use for two hours after being fed or watered. Arsenic in small doses is a favorite remedy with dealers; doses—begin with three grains a day; increase to five in a week. Continue for a month. 2, Law's Farmers' Veterinary Adviser; price $3, to be had of the American News Co., Chambers St., N. Y.

Selecting Seed Corn.

W. S. M., in Rural of April 14, asks: "what kind of ears are best for seed among the varieties of corn grown by him, etc." The only way to measure the capacity of any grain is by the *product of one grain* and not by the acre. This is a point too often overlooked by farmers, because it is—I suppose—on too small a scale. If W. S. M. will take one stalk of each variety and, after ascertaining its product in ounces together with the stover it took to feed it, he will soon conclude which is "best." If he desires an eight-rowed variety, he must breed to it the same as one would breed stock to a color or any other quality. As in the animal kingdom so in the vegetable—one is as susceptible of improvement by breeding as the other. Always select even-rowed ears and ears whose rows are straight, not irregular on the cob. Ears that taper are best because better protected by the husk; and then, too, the silk—the female part of the plant—remains alive longer. My reason for selecting the top ear for seed is that it is always more fully developed, more uniform and more vigorous in its germination, having been better fertilized when in the silk. A. E. BLOUNT.

The Wild Onion.

L. H., Jericho, N. Y., asks how shall he get rid of this vile weed. It is a great nuisance in his pastures, so strongly flavoring the milk of the cows feeding there, that it can't be drank in the family, nor the cream used for making butter. Thus he has to keep his cows out of the pasture till the tops of the onions become so dry in June, that the cows will not touch them.

ANS.—The only way is to get a suitable, close three-tined fork, and dig out every root by hand, which can be rapidly done by children; or else plow up the pasture and put it into hoed crops. The wild onion spreads with great rapidity. We find it on gentlemen's lawns in various places, and they resort to the hand fork to get rid of it. Perhaps pouring a teaspoonful of oil of vitriol on each plant, as in the case of this tles, may kill the onion. This can be bought at a cheap rate by the gallon, but the person using it must be very careful not to let any of it drop on his clothes, for if so, wherever it touches, it will make a hole through the cloth.

Miscellaneous.

M. A. L., Preston, N. Y., asks, 1, where can King Philip's and Improved Dent corn be obtained, and will they thrive in this locality; 2, what ails his Flowering Maple—the leaves look all right when they first appear, and later on become spotted, like a sample sent; 3, are there any books published on the Kindergarten method of teaching; and if so, what books would we recommend for a young teacher who desires to teach by that method?

ANS.—King Philip is an Eastern variety, and will, no doubt, do well in the above locality; as for the Dent, we cannot say how well it may succeed, but it is worth a trial. Both varieties can be had from any large seedsman advertising in the RURAL. 2. The leaf sent is that of an Abutilon. The spots are natural and not indicative of any disease. 3. Though there have been several books published on the subject, none of them can impart a thorough knowledge of the system to a solitary student; one must be regularly trained. Kindergarten Culture, by W. N. Hailman, and Paradise of Childhood, by W. E. Wiebe, are books that will give an insight of the system. The American Kindergarten is kept at 93 East 10th St., N. Y. city.

R. Y., Beckwith, Tenn., has five one-year-old mules, all fillies; their fore-legs are sprung in the knee-joints, inclining inwards; otherwise they are in prime condition, having been well fed and sheltered, and he asks whether there is any remedy for the ailment.

ANS.—This sounds like one of the many forms in which "osteo-porosis" or "big head," as it is commonly called, attacks young animals; but the description of the symptoms are not full enough to enable us to decide the question definitely. Will our friend please answer the following questions, that we may reply in a satisfactory manner. 1st, How many animals are on his farm? 2d. How sheltered and fed? 3rd. Are any of these mules lame, and where? 4th. Are all of them affected in the same way, or are some lame behind? 5th. Have any of them enlargements about the lower jaw or face? 6th. How is their appetite? 7th. Is there any pain on pressure of the bones of the affected limbs?

M. A., Cumberland, Md., asks if it would be advisable to use Paris-green on melons and cucumbers as a remedy for the cucumber beetle and other insects.

ANS.—No, Paris-green is too dangerous a material to use indiscriminately on plants whose fruit or foliage is eaten. Not long since we noticed the poisoning of a whole family in Canada, by eating cabbage on which it had been sprinkled as a remedy for the cabbage worm. One such example ought to teach an impressive lesson in regard to the danger that attends its use. *To sprinkle this poison on cucumber vines is to jeopardize life.*

H. S. G., Fulton, N. Y., has bought some potatoes under the name of Beauty of Hebron, of a prominent seedsman, but they are so small and white in color that he doubts their being true to name, and therefore sends a specimen to us for identification.

ANS.—The potato sent is so imperfectly developed that even professional potato experts cannot identify it. It certainly does not look like the Beauty of Hebron. Its somewhat pale color is not an absolute proof that it is not what it purports to be; the color may change to some extent with the kind of soil in which the tuber is grown.

T. J. E., Pleasanton, Texas, asks how many cows can a bull serve, the cows to run loose in a pasture or to be herded; the bull to stay with them all the time.

ANS.—That depends on the age and vigor of the bull. While 25 would be enough for a yearling animal, a full-grown bull could serve double, or even three times the number.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, April 30th.

BULLETIN 38.—April 24, 1880.

FERTILIZER ANALYSES.

376. Mapes' Potato Manure, Guarantee, Ammonia 45-5 per cent., Phos. Acid, 8-10 per cent. Potash sulphate and muriate one half of each, 6-8 per cent.

377. Mapes' Grass and Grain Spring. Top-dressing. Guarantee, Ammonia 5-7 per cent Phos. Acid. 6-8 per cent., Potash, in form of sulphate and muriate, one half of each. 5-7 per cent.

378. Mapes' Complete Manure ("A" Brand) Guarantee Ammonia 3-4 per cent., available Phos. Acid. 10-12 per cent., Insoluble Phos. Acid. 2-4 per cent., Potash as Muriate 2 1-4 3 1-2 per cent.

379. Mapes' Corn Manure. Guarantee, Ammonia 4 1-2 5 per cent., Phos. Acid. 10-12 per cent., Potash as Muriate 6-7 per cent.

The above were manufactured by the Mapes' Formula and Peruvian Guano Co., New York, and sold by Albertus N. Clark, Milford.

380. Superphosphate made by Russel Coe, Linden, N. J., and sold by E. B. Clark, Agent.

381. Superphospbate made by Lister Bros., Newark, N. J.. and sold by Albertus N. Clark, Millford. Guarantee, Ammonia, 2.85—3.25, Available Phos; Acid, 10-12 per cent. Insoluble Phos. Acid, 1-3 per cent.

384. Ammoniated Bone Superphosphate made by the Geo. W. Miles Co., Milford, and bought from Manufacturers.

The above three were sampled and sent to the Station, March 22, 1880, by Joseph W. Nettleton, Milford.

386. Mapes' Complete Manure ("A" Brand) same as 378) sold at the Hartford Branch of Mapes' Formula Co., sampled and sent to the Station, April 3, by L. S. Wells, New Britain.

382. Ground Bone made by Lister Bros., Newark, N. J., and sold by Albertus N. Clark, Milford, Guarantee, Nitrogen, 2.50-3.09 per cent., Phos, Acid 11.50-13.50 per cent,

383. Ground Bone made by Peter Cooper, New York, and sold by E. B. Clark, agent, Milford.

Both the above were sampled and sent to the Station by Joseph W, Nettleton, Milford.

388. Bone Meal from Mapes' Co., Hartford, Guarantee, Ammonia 4-5, Phos. Acid 20-26 per cent.

Sampled and sent April 5, by L. S. Wells, New Britain, as were also the following:

390. St. Louis Castor Pomace made by Collins Co., sold by F. Ellsworth.

387. Muriate of Potash, 80 per cent Mapes' Co.

389. Sulphate of Potash, 70 per cent, Mapes' Co

Est. value of fertilizers per ton.	$28 63	$42 36	$45 97	$28 02	$45 83	$53 52
Cost of fertilizers per ton.	$30 00	$32 00	$42 00	$20 00	$40 00	$65 00

382. Contains 15 per cent. of salt cake or sulphate of soda, soluble in water.

388. The potash equals 79.8 per cent. of muriate of potash.

389. The potash corresponds to 66 per cent of sulphate of potash, but there is present 7.56 per cent. of chlorine, which is equivalent to 15.9 per cent, muriate of potash.

CORRECTION.—The per cent. of salt in "Refuse Salt Washings" No. 357, misprinted in last Bulletin, 67.02 per cent. should have been 67.92 per cent. The per cent. of salt in "Kiln Refuse" No. 358, printed 92.20 per cent., should have been 97.20 per cent. S. W. JOHNSON, Director.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

CONDUCTED BY
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, MAY 8, 1880.

REMOVAL.

THE RURAL NEW-YORKER is now in its new quarters, No. 34 Park Row, corner of Beekman Street.

MR. THOMAS, of Illinois, has introduced a bill into Congress imposing a tax equal to ten cents, on every pound of oleomargarine, and authorising the Commissioner of Internal Revenue to issue special stamps to be affixed to the packages thereof. Moreover, the bill provides a penalty of 100 per cent. additional tax and a fine of $1,000 for evasion of, or noncompliance with, the law imposing the tax. The passage of such a bill we believe to be impossible, and its introduction injurious to the interest it claims to subserve. It is of a piece with that foolish petition recently sent out for signature by the International Dairy Fair Association. The tendency of both is to bring contempt and ridicule upon the legitimate demands of farmers and dairymen in this matter. However earnestly these may desire the suppression of this new industry, they should be too intelligent to think for a moment that at this day this desirable object can be brought about by prohibitory taxation upon it, or by any other legislation hampering the manufacture of a healthful product. What we should insist upon is that the stuff shall be sold only under its proper name, and not as butter; that some easy mode of discriminating between the two shall be determined upon; that the healthfulness of the product shall be thoroughly investigated; and that due precautions shall be taken that it shall not be made either from materials or in a manner hurtful to the health of the public. The laws should be stringent on these heads, and measures should be taken to provide as well as possible that they shall be rigidly enforced. The justice and expediency of such demands must secure their prompt concession, for in them the vast dairy interests of the country insist upon only what must receive the hearty assent of every lover of honesty and fair dealing.

THE DEVELOPMENT OF NEW ENTERPRISES.

THE present enormous expansion of our industries consists more in the development of new enterprises than in the extension of the staple existing ones. It is true that every new-found industry or product helps to stimulate the old ones, but the vast increase in business which is made year by year is due to the new paths cut out by enterprising pioneers and into which crowds press and force their way as soon as the prospect of success is opened. This fact is so constantly obvious that we may be spared the labor of indicating examples. It is one that speaks for itself. Our greatest industry—agriculture—follows its fellows in their onward march but lags behind somewhat, being hindered greatly for want of those means by which other industries make such bold and successful advances; namely, association and capital. Yet agriculture is moving on, and new enterprises are carried on to sucessful developments.

Foremost among these is the foreign trade in meat and live stock. From the small beginning of four million pounds in 1875, the business has grown to fifty-four million pounds in 1879, and the shipments of the present year are still surpassing previous figures. In 1880, up to the 31st of March, nearly seventeen million pounds had been sent abroad, and the promise of still larger exports is very favorable. The extension of this business cannot fail to be of the utmost importance to American agriculture. It has as yet but just begun. The first dawn of day-light, as it were, has gleamed, and bears no comparison with the brilliance of noon-day that is to come. Let us consider the prospect.

Hitherto everything has been disastrous. Commercial depression, previously unexampled, bore heavily upon the English nation, and the purchasing power of those consumers to whom we must look for our market has been at the lowest ebb. The business was new and prejudice was evoked with the greatest vigor. Now, matters are changing for the better. The condition of the poorer classes of English people is rapidly improving, and already they are largely increasing their demand for cheap meat. They have found, too, that all the charges of unsoundness, parasitic infection, and poor quality, which have been made against our meat, have been invented by selfishness and malice, and they have learned and now understand the trick of exposing and selling our good meat as "home-grown," so that we may expect and prepare for a vast increase in the demand for our meats at a certain price, with which English farmers cannot compete. The price is profitable to us. Ten cents a pound, dressed weight, on shipboard, will well pay our farmers who own their own lands, and the business can afford to pay it.

Again, while England has been the subject of experiment, France, Germany and Spain have been watching the result. A hundred millions of people of these three nations await the opening of this business with them. Nine out of ten Frenchmen rarely eat beef. To procure it is beyond their means. So scarce is this meat in France that a piece of it is boiled first and the soup eaten for one meal, and then the meat is baked or roasted, in their rather poor way, and used for a second meal; meanwhile, the bones are digested until the gelatine is abstracted, for the furnishing of another meal. In Germany something of the same sort prevails, and American beef, in great part, must provide for their needs. The great West is fast becoming occupied, and herds are filling up the most remote valleys. The opportunity of the East and near West is coming, and will afford an opening for largely increasing the supply of meats. It is to such new opportunities, rather than to any large increase of our present staples—wheat, corn and dairy products—that we must look for the necessary development of our agricultural operations. There are others which might be suggested, as the beet sugar production which has a promising future, for one. But the subject is one that calls for individual thought, rather than public discussion, and as such we present it to our readers for their digestion.

A FALLACY AND A TRUTH.

WE often notice in the religious and other press, or hear from the pulpit, what seems to us to be a fallacy of inference. And yet, as usual in such cases, it contains an element of truth. Both seem to us to be found in Longfellow's beautiful stanza,

> "Lives of great men all remind us
> We can make our lives sublime
> And, departing, leave behind us
> Foot-prints on the sands of Time."

The next stanza in the poem brings out the element of truth more clearly, and we shall advert to it presently. But the fallacy in this stanza is so common! "Lives of *great* men?" Ah, but most men are *not* "great," and never can become so by ever so eager and long-continued striving. "Make our lives sublime?" Yes, one in a million may. The rest of us must be content to make them good, useful, perhaps even noble in some sense. But how few can ever make them "sublime!" And here is just the harmful fallacy. How often we hear or read it. The preacher says, "Harlan Page, an uneducated mechanic, was the means of saving a thousand souls. By like consecration you may do as much." Or, "Mary Lyon did a work whose blessed effects shall endure through all eternity." But Harlan Page was as truly a genius in his way as Edison or Milton in theirs. Mary Lyon was a Century Plant, and there may not bloom her like again for a hundred years. Why not say, "Look at Edison's inventions and go thou and do likewise?" One man in ten million may. The rest of us may not. We were not born inventors. The plow horse may not became a racer.

The Professor of Elocution says to his class, "Even Demosthenes had an impediment in his speech. See then what you, too, may accomplish by like patient elocutionary drill." Ah! but Demosthenes had something *back of* that impediment, struggling for utterance, and Philip was threatening the liberties of Greece! Eloquence was "in the occasion and in the man." Without these, "elocutionary drill" to all eternity will not make orators. It may indeed cure stammering, but it will not produce eloquence.

Or some writer or speaker says, in brief, "Look at Benjamin Franklin or Horace Greeley and learn two things:—first, what you, too, may become, and second, that a liberal education is not an essential to greatness." But you may draw neither inference fairly. You cannot become a Franklin or a Greeley (ten thousand chances to one); nor were these men without a liberal education, though neither of them went through college. But you *may* become a better and an abler man than you are, and you need not be uneducated, though it may be impossible for you to graduate from any college. *These* are fair and not fallacious inferences.

These slight hints perhaps sufficiently point out the fallacy, and our last sentence indicated our thought in regard to the element of truth in the "morals" so often pointed from the "lives of great men." The next stanza in the beautiful poem already quoted from, contains that element.

> "Foot-prints which, perchance, another
> Sailing o'er life's troubled main,
> Some forlorn and shipwrecked brother
> Seeing, shall take heart again."

Foot-prints of an *ordinary mortal*, not of a giant. *These* might frighten or dishearten. *Those* will encourage. And those are the only "foot-prints" the most of us can make. We can be kind and helpful and useful, and truly gentlemanly in heart, word and deed. We can magnify our calling and make it honorable. We can promote the material or intellectual and moral welfare of those among whom we live. We can give our children a better chance of growth and a better culture than we had ourselves. We may "live righteously in this present world;" not ostentatiously displaying a sentimental piety or religiousness, but *having*, and hence inevitably showing, that "downright uprightness" of character and conduct that all men everywhere admire; and really possessing that "purity" that "thinketh no evil" and "doth not behave itself unseemly."

Notice a few harmful maxims, "Aim high if you would shoot far." But we do not care to see how far we can shoot. That is child's play. We care to *hit the mark*, and to that end *aim at the mark*. Take another maxim, "They that aim at the sun shoot higher than they that aim at mundane things." True, but they never hit or bring down mundane bird or beast by that style of aiming. Sportsmen nowadays *aim at* the game they want to bag. So with any young man. A towering ambition is harmful. Let him learn to "think of himself soberly." He will soon find he is not a "mute, inglorious Milton," or a Napoleon, or a Webster. Let him seriously estimate what he is capable of doing and then *strain every nerve to do it*. Let him take an honest inventory of the physical, mental and moral gifts bestowed on him by nature, and set about the task of wisely using and increasing them. Let him not try to use powers he does not possess. Let him not think because the eagle can soar aloft with a lamb clutched in his talons, that therefore, the jackdaw must entangle his claws in the fleece of a ram. Nor, on the other hand, let him bury his one talent in the earth because his Lord did not give him ten talents.

The lives of great men are inspiring and most useful examples, if intelligently studied and wisely imitated. They are, we think, harmful as held up in many memoirs, pulpits, speeches and editorials. They are useful if they prompt us to as great faithfulness and diligence in the use of our small powers, as such men have shown in the use of their great powers. They are harmful if they prompt the ambition to attempt impossibilities, and thus follow a delusive "Will-o'-the-wisp," or to refuse to use diligence in the foolish belief that we have genius. Judicious teachers do not tell their pupils they may all be Presidents of the United States. It is a pity to "spoil a good blacksmith to make a poor minister or lawyer."

BREVITIES.

STUDY both politics and agriculture—but, agriculture *first*.

PROFESSOR Storer's article, in another column, will be found to confirm the results of our experiments with wevil-eaten peas.

LET our farmers combine to nominate and to support candidates who know something of agriculture and who will therefore study to promote its interests.

FROM what the writer of this note has seen of the much-praised Sorghum halepense in the South, we caution our readers against introducing it upon their farms in any part of the country where the roots are hardy enough to endure the climate.

IN sheer self-preservation New York has at last passed a law punishing "tramping" with a year's imprisonment; but as it defines a tramp as a vagrant without any visible means of livelihood, farmers may expect a visitation of peddlers of trifles in the ragged guise of the old terror.

HALESIA TETRAPTERA is very abundant among the mountains of western N. Carolina, where it has been in bloom for a fortnight. Our nurserymen deem this one of their finest, large shrubs or little trees, and charge about one dollar per single plant. It is rarely seen in Southern gardens. This is, in familiar language, the Snowdrop or Silver-Bell Tree.

IN reply to many inquiries, let us state that Early Amber Cane seeds are sold by all seedsmen for about $5 per bushel. As has repeatedly been stated in these columns, it is as easily grown as corn, four or five quarts being sown to the acre in hills or drills. Land that will raise 50 bushels of shelled corn, needs no special fertilizing, since an over-thifty growth is not desired.

BY a letter from President John G. James, of the State Agricultural College of Texas, we learn that the chair of Scientific and Practical Agriculture at that college, which has been endowed with the Congressional Land grant, will be filled by the Board of Directors next summer. Applications for the position can be filed at the President's Office, College Station, Brazos County, Texas, until June, 25th, 1880.

DON'T wait till the crops come up to destroy the weeds, but the moment they appear attack them. They can be destroyed early in the season with one-fifth to one-tenth the labor that they demand if left to multiply and enlarge later on. One of the best implements for this purpose is a harrow with fine, thick-set, steel teeth, sharp-pointed and sloping in the rear. These can be made wider or narrower, lighter or heavier, as required.

IT is said that there are 34 persons in the United Kingdom who are owners of above 100,000 acres each. The largest of these is the Duke of Buccleuch, who possesses 459,260, the acres gradually diminishing down to the Earl of Montrose, who has only 103,760. The total is 6,004,107 acres belonging to the above 34 persons. Our California and Great Western Plains friends, will have to whip up a little to obtain as large estates each as are specified above.

IN small gardens where it is desired to bring forward melons, beans, etc., as early as possible, the following plan, though far from new, will prove serviceable. Prepare the soil the same as if the seed were to be planted in the usual way. Then place four bricks so as to form a square at suitable distances. Plant the seeds within this square and cover with a pane of glass. In this way, as a matter of fact, miniature cold-frames are formed without much trouble or expense. The same plan may be adopted to forward any kind of flower seeds.

WRITING to the London Ag. Gazette, Prof. Morrow remarks: "In making estimates as to American agriculture, the necessarily rapid enlargement of the cultivated area from year to year must always be kept in mind as an important factor. This extension of the cultivated area is greater than the increase of population, so that, with equally good crops, the surplus for exportation grows larger each year." If our late wheat reports from all parts of the winter-wheat growing areas of our country, forecast one thing more than another, it is that wheat will rule low another season.

OF the two British Commissioners who lately visited this country to investigate American agriculture, Mr. Clare Sewell Read, Conservative has been relegated to private life, the electors of South Norfolk having, in the late election, preferred a Liberal land-owner to the only representative of tenant farmers that had a seat in the legislature. Mr. Read was a persistent stickler for tenant farmers' rights and prominently mentioned as Secretary for Agriculture on the hoped for establishment of a new Ministry of Agriculture. He and his opponent had the same number of votes, but on examination of the ballots it was discovered that while all those for his rival were correct on one of the ballots for Read, the voter's name was written on the back of it—a slip that rendered it inadmissable. His Tory principles caused his defeat in the late Liberal upheaval. Mr. Pell, the other Commissioner, has however, been re-elected.

THE Hon. F. P. Root states, in the N. Y. Tribune, that there is no soil that has proved more enduring for wheat than a calcareous clay loam of alluvial formation. Though this is the character of a large portion of Western New York, yet the alternate cropping with wheat and clover has resulted in exhaustion of the mineral properties of the soil. Years ago Mr. Root thought, while pursuing this alternation, that the abundant crops would never fail; but after following the system for ten years, his wheat became less fair and plump. The growth of straw was in most cases increased, but the yield of grain was less. The clover also began to fail so that he found it difficult to get a good seeding. Finally, in 1854 and '55, he met with a total failure, still having an abundant growth of straw. It was finally found that the use of mineral fertilizers was necessary to restore to the land its former productiveness, and the average yield of wheat in the past three years has been greater than in any like period in the previous quarter of a century.

THE members of the St Louis wheat ring are said to have combined with those of the Chicago ring to stiffen prices. For months wheat has been extensively sold to be delivered in May, the sellers in many cases never intending to deliver a bushel, but merely to receive or pay the difference between the price at which they sold and that at the date at which it was to be delivered. These at the opening of the month were "short" on wheat; whereas, those who had more on hand than they had sold, were "long." It was therefore to the interest of those "long" on wheat, to raise prices, hence they are the "bulls" in the market, whereas the others are the "bears," the former always tossing up prices and the latter pulling them down. The St. Louis "bulls," then, having combined with those of Chicago, are said to have made somewhat of a "corner" in wheat, sharply pinching the "bears," and to this movement is due the stiffer tone of the wheat market noticeable in our reports. This will hardly last, however, as the "bulls" of this week may be the "bears" of next, according to the obligations they have meanwhile incurred and the state of the market.

Literary Miscellany.

JOHN ASCOTT'S DAUGHTER.

BY CHARLES RICHARDS DODGE,
Author of "Louise and I."

(Continued from page 285.)

CHAPTER III.

CHASING A BUTTERFLY.

Upon a warm and pleasant afternoon towards the latter part of May, George Ashton took his gauze net and collecting apparatus and sauntered out to spend a few hours with nature, in the pursuit of knowledge and—insects. No doubt the reader's nose is slightly elevated at the bare suggestion of a grown up young man engaging in such an undignified pursuit, an amusement belonging particularly to the juvenile age. Dear reader, are you aware that we are all chasing butterflies, and the greater part of mankind chases them with no better success than attends the truant boy? See how he pursues the splendid creature from flower to flower, now almost possessing the gaudy prize, in a moment losing it as it soars above him, following it over field and meadow, and through tangled wildwood, here and there, up and down, breathless, panting and weary, while the fields are full of golden buttercups and tiger-lilies, and the woodland offers its rarer floral treasures for the mere gathering. How eagerly and earnestly is the pretty painted thing pursued, and when it alights again with what breathless caution does the youth draw nearer and nearer, and at last, exultant, the long-sought prize is grasped—and it lies in his hand a crushed and lifeless thing; its grace, its beauty, and all that made it worth having gone out with the feeble, vital spark! If you are a man of the world, what airy project are you pursuing, charmed only by the glitter of its wings as it floats so gracefully in the blue ether above you. Is it worth having, should you, one day, find it within your grasp? Will its possession repay you for all the toil and anxiety of pursuit? Or perhaps, your gentle nature chases a butterfly of fashion and society, running a race as mad and wild as ever did rosy-cheeked boy, only

"To find at eve its wings are soiled and torn,"

but this is a long digression.

Following in the footsteps of the truant youngster, George left his work in the laboratory at an early hour, upon this pleasant afternoon, and started out to chase buttertiles. To make their capture a certainty, however, he was provided with a deep net of white gauze secured to a pole as tall as himself; and at his side hung a collecting box lined with cork.

A cushion upon the end fairly bristled with long, sharp pins, with which to impale the helpless victims,—and his pockets were burdened with sundry bottles and pill boxes, all in the interest of science. He had rambled for a couple of hours unmindful of the direction taken, when he found himself approaching, as he thought, a large private park upon the estate of some country gentleman. Sauntering slowly along a neglected by-path that he knew must lead before long into a traveled road, his mind filled with pleasing fancies, his eye was suddenly attracted to a rare and beautiful insect hovering over a thistle bloom, not twice the length of his net-rod distant. It was a prize worthy of capture at any cost and he proceeded to reconnoitre. Fortunately its head was turned in an opposite direction, and as it gently opened and closed its richly-colored wings while resting with airy grace upon the flower, it displayed its rare beauty to the best advantage. A quick maneuver and the next moment the splendid creature was sailing high above his head. Was anything ever more provoking? After wheeling about a moment in mid air with no fixed purpose, it suddenly darted in the direction of the grove, and George, more eager for capture than ever, started after it in hot pursuit. With net held high in air, straw hat flying by its guard, and face flushed with exercise and excitement, over stone walls and across the field he flew—through briars and under-brush, on and on, until the very grove was reached. Will it enter? It passes the low shrubbery at the edge of the park, mounting high above a clump of young undergrowth in its flight, and plunging through the thicket in wild pursuit, the young man emerged upon the other side, breathless and hatless—and found himself face to face with a very pretty girl, lying in a hammock reading.

To state correctly which evinced the greatest surprise, the lady or the young man, would be an extremely difficult matter,—but the shock was so sudden she lost her book in the grass while indulging in a slight feminine scream, and he forgetting entirely his *Papilio* gave expression to a remark most easily indicated by the fifteenth letter of the alphabet and a row of exclamation marks.

"I didn't know,—that is, I thought—really pardon my rude intrusion," he stammered, as he stooped to pick up the fallen volume.

"Thank you," she replied, with evident embarrasment," no apology is necessary, but——"

She did not finish the sentence, and as the young man had nothing further to say, for a moment they simply stared at one another; then their eyes met, they both saw the ridiculousness of the situation and laughed in spite of themselves. She was rather above the medium in hight, with fair, fresh, complexion and full oval face. Her forehead was low and her brown eyes large and deep set, but her soft chestnut hair caught loosely at the back of her head particularly attracted George's attention. An awkward silence followed for a moment and the young man, not knowing what else to do, again begged the lady's pardon for his rudeness, said good afternoon, and retraced his footsteps to where his hat had fallen.

"Who is she?" he mused, "I have lost the butterfly, but what does it matter after such an adventure."

There was something so attractive in the face that had so suddenly burst upon him he felt irresistably drawn to it again, and before he was hardly aware of his intention, found himself once more confronting the beautiful girl.

"Excuse me,—I have lost—my handkerchief," he faltered.

"I have seen none," she modestly replied; "what was it like?"

"It had a blue border," he answered, looking full into her eyes.

"You have such a one on your neck now," she remarked, with a faint attempt at a smile.

"Have I, oh, thank you" he answered, blushing slightly.

There was evidently nothing to do now but to retire again, but something still held the young man, and in another moment he said "your face seems familiar, have we ever met before?"

"I do not know" she replied looking full into his eyes; you remind me of a friend I once had, years ago, though the resemblance is not very striking. We were playmates."

"Was his name George Ashton?"

"Are you George Ashton?" she asked archly

"You are May Ascott I know" he replied with warmth, putting out his hand to her.

"Yes, I am May Ascott, but I never dreamed we should meet again, after so many years." She rose from the hammock laid aside her book and advanced to greet him. "What are you doing here."

"Chasing a butterfly I should think from appearance," the young man answered, blushing now in real earnest." And you——"

The eyes of the fair girl fell at the question. She stood thus, a moment, and then looking into the manly face before her answered with nonchalance, "I am living here for the present—as—a governess."

"And I am at College in N——" George answered quickly.

"Then you are near."

"So near, I shall be happy to chase butterflies often in this direction—with your permission, Miss Ascott."

"I shall be pleased to see you. I am at leisure Wednesdays and Saturdays in the afternoon."

"I shall certainly come, and I am so glad we have met again after so many years. It is strange I should know you for you have hardly a look of the little girl with whom I played at Maplewood."

"It is pleasant to renew old acquaintance," the girl replied timidly.

"We must become good friends again, and I want to know what you have been doing all these years."

"I fear my story would not interest you. There has been little of interest in it for *me*."

They talked on a little while longer, until, mindful of his long walk across the fields to N——, George said good-bye, promising to come again at the earliest opportunity. Those were pleasant days indeed that followed, while they lasted, for in a few short weeks, school days were over, and the young man returned to his home in a distant part of the State.

CHAPTER IV.

A WILL AND A WAY.

It will not be necessary in this brief history to dwell long upon the three years of George Ashton's life that followed his leaving college. He had studied well, fairly earned his degree, and graduated with honor; but, after all, he found himself questioning in what possible way could his education be made to directly assist him in earning his bread. Many of his classmates who had taken "practical courses" as his father called them—civil engineering and the like—had stepped into good positions or found employment upon leaving the walls of Alma Mater. Others had become better fitted to enter business pursuits for which they appeared always fitted, but George seemed to be a round peg in the midst of a multiplicity of square holes. Could he have had his own way he would have spent the remainder of his days in the study of that mysterious nature with which we are surrounded—that enters so closely into our very lives, and of which we all know so little, but the question of bread and butter was so all-important a one—indeed one of the first questions to be considered in the solution of the "theories of *life*"—that he left the fields of scientific research for a book-keeper's desk, near home, at a merely nominal salary. Here he found himself in the squarest kind of a hole, through which he dropped completely before the year was finished. Several other holes were tried in like manner, with a like result—they were all square—and at the end of the three years we find him a good-looking young man of three or four-and-twenty, out of employment and chafing under the restraints of his father's house. As has been stated, he was not wholly dependent upon his father's bounty, for a maiden Aunt had left to him her little property amounting to several thousand dollars.

In the meantime the renewal of the acquaintance with May Ascott had led to something more than friendship upon his part. They had corresponded from the time he left college, and a year or two after, "fortune" threw them together for a whole summer, at one of the resorts upon the coast, whither she had gone with the De Fond villes, in whose family she made it her home. Thus their intimacy, strengthened by the sentiment of childish recollection, early ripened into that tender regard which often prompts brotherly and sisterly feelings rarely experienced by blood-relationship.

A few weeks previous to the opening of the story he enjoyed a brief sojourn in N——, and the date of this visit may be fairly called the turning point in his life. It was then that he told sweet May Ascott of his love for her, a love she had known and reciprocated long ere his lips had confessed it. It was then he told her of his plans for the future, and of his resolve to *do* something in the world. Then it was that he asked a promise of her, a sacred promise to become his wife, when hey were both ready, and received her woman's answer, trustful, confiding and true. He did not care if the whole world knew it then—his brothers had known of an attachment before, and holding their father's prejudice had ridiculed it—and he came home with a new impulse for work.

The idea of going into farming was no new thing with George Ashton. He had always hated confinement, and the thought of having to earn his living in business pursuits, in the ordinary acceptation of the term, was exceedingly distasteful to him. Here was a pursuit in which he might enjoy the freedom of out-door life, and while laboring for his daily bread, have opportunity, for the study of nature in its highest sense to gain a knowledge of its laws and learn how to apply them to the service of man. Yes, the farm was the thing! The lack of money to buy it had been the principal difficulty in carrying out the idea, but thanks to Aunt Jane's preference, this, in a measure, had been removed.

A little bit of sentiment, too, entered into this matter of buying a farm. After it was bought he hoped to bring a wife to it some day, and he knew by bringing her to the home of her childhood he would bestow a great happiness upon her. That was the sweetest part of the idea, and as a man has seldom the opportunity to perform so simple a business transaction, and, at the same time, do so charming an action for the woman he loves best in the world, you may be sure George was in earnest about it. May knew nothing of this, of course. To her it was but a farm, her husband's farm—that was to be—and she was going to help him make it a success; but to him it was not only a farm but *the* farm, in fact, May Ascott's farm, for she should never have been cheated out of it by the devilries of her rascally half-brother. He regarded it an exceedingly fortunate circumstance that Maplewood was in the market. When it passed from the Ascotts, it was bought for considerably less than its real value, by a gentleman who soon became tired of rural life, and for a term of years it had been under lease to a neighboring farmer.

It was now for sale, the time had come to talk of purchase, indeed George had "talked" purchase with the owner to as full an extent as was necessary short of actually closing the bargain. A little aid from his father was necessary, however, before that important transaction could be gone through with; he could well afford to assist him and he resolved to broach the matter at the earliest opportunity. After several weeks of waiting for the favorable moment—for he knew the old gentleman's weak points, and shrank from arousing his prejudices—the time arrived, and the request was made, with what success the reader is already aware.

It was a cruel disappointment to the young man for he had no idea that the old feelings of bitterness against an unfortunate neighbor, dead long years, could extend to the living daughter, but after all he felt himself more a man for the experience. His father dared to speak lightly of the woman he loved, had even threatened to "cut him with a shilling" if she ever became his wife, and stung and maddened by the fatal opposition, he was roused to a sense of manhood and dependence upon himself that he had never felt before. "Where there is a will there is a way," and when there is a woman in the case the *will* is generally a foregone conclusion and sometimes it's a pretty strong one. Mr. Ashton heard no more of the farm project, and supposed he had "sat down" on the thing so effectually that he should never hear of it again; but George kept his own counsel, made more frequent visits out of town, while towards his father conducting himself in so proper a manner that the old gentleman really had hopes of him.

Mr. Ashton felt in a particularly good humor one evening, a month after the occurrence related in the first chapter, and as George had just returned from the lawyer's, he too was in the best of spirits.

"Well, George," said his father, "I have about made up my mind to buy that Ascott place myself; it's good property."

"Do you really think so?"

"Yes, at the price you named I think it a good investment."

"I am glad you agree with me for once, father; your opinion is a compliment to my judgment."

"Do you think you could really manage such a piece of property?"

"I feel fully capable of it."

"And make some account of your chemistry and your botany and the bug-nonsense you learned at N——?"

"I certainly believe in science with practice, father."

"By the way, your cousin Jennie is coming here to spend a month. She's only a forty-second cousin, I suppose, but she's a smart gal, and ought to be included in the family. I like Jenny."

"Oh, she's a fair sort of a girl, I suppose; a little old fashioned," George replied.

"What did you say?" the old gentleman asked abruptly, eyeing his son very sharply.

"I said she was a fair sort of a girl, but rather *slow*."

"I don't understand you," said the elder Ashton, his eye growing a little colder.

"Well then, she's not the sort of a girl I should choose for a wife, if that's what you're driving at.'

"Oh, she isn't, eh!" his father replied sarcastically. "Perhaps when she owns Maplewood, and has a few thousands in her own right, you'll think differently."

"She will never own Maplewood, father," George made answer, his lip curling scornfully.

"The devil she won't, you young scapegrace. I'll buy the place to-morrow," and the old gentleman brought his fist down upon the table with such force that a pair of wine-glasses sitting near were shivered.

George looked at his father a moment, and then replied firmly, but with great calmness, "I hardly think you will."

"You—hardly—think—I—will. Why—why—damme—oh—ugh! What do yo mean, sir, by daring to talk to me in this way?" he fairly roared.

Having *just purchased it*, I am not ready to sell, besides as I shall marry Miss Ascott in less than a month I shall need it for a home for her.

The storm broke in its fury; the thunder crashed and rattled over the devoted head of the young man, while forked lightnings seemed to play all around him until the atmosphere grew livid. The torrents of wrath descended as though the flood-gates had burst their bars—and then there was calm.—[To be continued.]

BRIC-A-BRAC.

A noble lord, as proud and as fond as a man should be of his beautiful young wife, was just about rising to speak in a debate when a telegram was put in his hands. He read it, left the house, jumped into a cab, drove to Charing Cross and took the train for Dover. Next day he returned home, rushed into his wife's room, and finding her there upbraided the astonished lady in no measured terms. She protested her ignorance of having done anything to offend him. Then what did you mean by your telegram?" he asked. "Mean? What I said, of course. What are you talking about?" "Read it for yourself," said he. She read: "I flee with Mr.—— to Dover straight. Pray for me." For a moment words would not come; then after a merry fit of laughter, the suspected wife quietly remarked: O those dreadful telegraph people? No wonder you are out of your mind, dear. I telegraphed simply: I tea with Mrs.—— in Dover street Stay for me."

The other Sunday the Sabbath schools had a lesson which involved an explanation of the term hypocrite. In one of the infant schools a teacher labored very earnestly to give her class a correct idea of the word. One little girl said she always thought it was a great big animal, and she guessed she had seen one at a show, "Oh," the teacher said, "a hypocrite is a man who makes believe to be real good when he isn't. Sometimes a man will give a lot of money to a church just to make people think that he is better than anybody else. "Well, my papa ain't a hypocrite," spoke up a little girl back in the corner of the seat, "for he only gives a penny every Sunday.—*Carbondale (Pa.) Leader.*

Oh, dear! I feel so tired," sighed Mrs. Hickenlooper, as she sank into a chair. "Well, I should think you would be," growled Mr. Hickenlooper, as he put on his coat to go out; "you tramped around more'n seven miles this afternoon making your silly calls. I shouldn't call myself half bright if I did such a thing." And then he went down street, and walked nine miles around a billiard table poking ivory marbles with a stick, at 25 cents an hour, and she thought how hard he had to work at his business, poor man, when he came home at midnight and dragged his enfeebled limbs into bed. Some women are just like that.—*Rockland Courier.*

Luck is a good thing, but one cannot always afford to wait for it. Pluck is a better thing, because it is always ready to begin.

The covetous man is as much deprived of what he has as of what he has not, for he enjoys neither.

MAGAZINES FOR MAY.

The Phrenological Journal and Science of Health—Contents: Wilhelm Richard Wagner Portrait; Philosophy of Superstitution; Comparative Phrenology; Beer and Cider Crusades; Labor and Social Co-operation in France, With Portrait of M. Godin; A Society for Guiding Children; Bits of Natural History from South Carolina; The Young Folks of Cherry Avenue. A Mischievous Boy and a consequence; Colds—How Caused and Treated; Milk as Food; A Gentleman of Color on Brown Bread; Hard Reading; Remedies for Cold Feet; Notes in Science and Agriculture; Editorial Items; Answers to Correspondents; What They Say Personals, Wisdom, Mirth, Library, Publishers, Department.

A Glacier in Colorado.—A gentleman who has traversed the mountains in the vicinity of Leadville, and penetrated almost every one of their secret recesses, informed the Leadville Herald that there is within twenty-five miles of this city one of the most interesting curiosities of nature—a veritable glacier, presenting all the characteristics of the glaciers of Switzerland, both in magnitude and motion, its progress being gradually down the gulch. The scene of this curiosity is located in the Mosquito range, about fifteen miles north of the pass. The traveler states that he first discovered it about three years ago, when out on a prospecting tour. It was then nearly a a mile in length, and at the bottom of the gulch presented a sheer precipice of ice not less than one hundred and fifty feet in hight. Later in the season the place was visited again, when it was found that the great mass of ice had melted, until at its face it was not more than one hundred feet high, the loss from the surface reducing its length to about half a mile. Again, early in the following year, the place was visited, and the glacier was found to have regained its bulk, showing that the accumulation of ice and snow during the winter was about one-third its gross bulk.

The rocks on the side of this immense mass of ice show the mark of attrition, proving beyond all controversy that the glacier is in motion. The earth at the foot of the glacier, heaved up in great masses, shows that it is gradually moving down the gulch into the valley. During the summer a large stream of water flows from the face of the ice cliff. The glacier, as it progresses out of the deep gorge in which it was formed, may slowly melt away, so that it will not last for many years. It is out of the way of ordinary travel, and the route to the scene is exceedingly difficult.—*Phrenological Journal.*

For Women.

CONDUCTED BY MISS RAY CLARK.

FASHIONS.

Among the most popular goods for spring and early summer we still note Indian cashmere, ever a favorite with many ladies, because it is softer lighter, and more durable than any other, and can be had in every possible shade of color. Besides the well-known tints still in favor, the most fashionable colors of the season are heliotrope; the favorite tint for toilets of ceremony, weddings and receptions, dark myrtle-green, *aventurine*—a reddish-brown—slate; all shades of willow-green, steel-blue, and buff for mantles. All prune shades, whether inclining to blue-color or to bluish purple, are in great request.

All these shades also exist in tolle-de-laine, a material lighter than cashmere, of the same width and less expensive, and also in muslin-de-laine, a still thinner fabric, very suitable for summer toilets, either employed by itself or combined with silk. There is yet a lighter, almost transparent fabric, called batiste-de-laine, which makes up very prettily for evening toilets, and is trimmed with unbleached thread lace and bows of satin ribbon.

In fancy goods we have, woolen moire, to which combined with plain cashmere or tolle-de-laine, makes up very stylish walking-costumes: woolen damasse and woolen brocade also for the same purpose. Indian cashmeres in shawl patterns are still very fashionable for the trimmings and accessories of both walking and indoor costumes. Bands of Indian cashmere, in small Oriental patterns, are to be had ready prepared for trimming dresses, and either fringed or not, at pleasure. They are used more especially for trimming dresses of such shades as seal-brown, beige, navy blue, ciel-blue, sapphire-blue, &c.

Brocaded and armure silks are also much used for trimmings, and are more fashionable this year than Pekins.

We are told the mantelet is to be worn in the summer again; but at present the favorite mantle seems to be the paletot, or rather a new modification of the paletot, neither very long nor very short, with rather wide sleeves, and of a tissue different from that of the dress; very often in fancy fabrics, such as figured Indian cashmere brocaded silk, and damasse wool and silk stuffs They are trimmed with crimped fringe, feather borders, or embroidered galloons. Their style is novel in that they differ from the dress, and as two self-colors would form too crude a contrast, they are made in preference of some figured material in well-harmonized shades of color. If, however, a plain fabric is selected for the paletot, it is trimmed with wide bands of Turkish cashmere in palm-patterns, edged with fringe. A buff paletot—buff is quite the fashionable color for paletots—is often trimmed with Turkish cashmere, the pattern of which is set off by a seal-brown ground the mixture of plain with figured materials still prevails in all toilets. When there is a jacket or coat-bodice of figured material, it has a plastron or vest of the plain tissue; and the skirt, of the plain material, is trimmed with scarfs, tabs, or panels of figured stuff.

These combinations are made as well with inexpensive woolen fancy materials as with rich silks and brocades; thus, tolle or muslin-de-laine, combined with woolen, moire, damasse, or brocade, or any other woolen goods, make up very pretty for drosses. And a very neat and elegant style is to have the paletot of the same material as the trimmings of the dress.

The pretty Pompadour and Watteau patterns shionable in silk fabrics are also copied in woolen batiste, and will be still more so in summer in washing materials, such as cambric, percale, organdy and printed muslin.

Most of the new walking-costumes are made with the long-waisted, tight-fitting jacket-bodice, the basque of which is round, pointed, or square, according to taste, frequently also it terminates in coat-lappets behind.

It is easy this season to modernize last year's dresses so as to make them look fashionable again. I will give a few hints on this subject, which may prove useful to some of my fair readers:—

Suppose you have one of the long princess-shaped polonaises so fashionable at the commencement of last summer. It can be made to look quite new and stylish by being open at the back instead of front, and fastened with satin bows to match. A princess-dress can be freshened up nicely by having plastron and tablier of figured material added to them.

If the bodice of any dress is worn out or no longer fashionable, nothing is easier than to have a jacket or coat-bodice made of some other material. If your dress be a plain silk, have some brocaded ditto and have bias bands of the same for trimming the skirt If it be of figured silk, take plain satin of the same shade, or of the color of the grounding, if it be multi-colored, for the bodice and trimmings. Unless the dress is very elegant and as good as new, satinette will be quite sufficient for making it up. For a dress of cashmere, or any other plain woolen tissue, wool and silk brocade, or Turkish cashmere in subdued shades of color will look well for the trimmings, and figured cashmere may be combined with plain silk or cashmere.

Spring jackets for young ladies are made of fancy cloth in different shades of beige, gray, brown and cream color. They are made tailor-fashion, with no trimming beyond stitchings and fancy buttons.

The shapes of hats are more fanciful than ever this spring, some being turned up at the side, some in front, and some at the back. Leghorn or rice-straw appear to be the favorites, and are lined with satin in rich, dark shades of blue, violet and crimson, with large birds and feathers on the outside.

The new straw bonnets are large in shape, with wide brim protruding in front, but with little or no curtain.

The boundary line between the hat and bonnet is very difficult to find out, as some bonnets look quite as flaunting as hats, and turned up quite as jauntily, many having no strings even to distinguish them from the former.

Many ladies however still prefer to such fanciful shapes the white, trimmed capote, the strings of which are now made of very wide ribbon, frequently brocaded or floriated, and tied in a large bow on one side.

THE GUEST CHAMBER.

Every house should have its guest chamber. One of our most beautiful and delightful social obligations is the duty of exercising hospitality gladly and freely.

Mrs. Whitney, in one of her most charming books, speaks of the great difference that exists between people in their ways of receiving visitors.

With some there is a perpetual showing off and trying on, as it were, becoming manners and conversation The atmosphere is not like the air of every-day life and everything is pitched in too high a key.

Others feel as if an entertainment of friends were a social convulsion, so to speak, in which nothing should go on or be done until the intruder has departed.

The true hostess takes you into her own home-life and air, brightened, if you are loved, by your presence there, varying only from the beautiful daily order and warmth by numberless pretty little attentions which every one has leisure to pay on the busiest day, and yet which make one feel so welcome. The kind questioning about the welfare of the guest's own household, the ready interest in her domestic stories—of the sayings and doings of the little ones, or of her own plans and work; the easiest chair brought forward to the warm and cosy place by the fire, or if it is summer the gathered flowers at the plate; these, and a thousand other trifling courtesies give your visitor the good of her change of air and place, her social intercourse, from which she may return home refreshed and strengthened, and glad to give to another the same kind of pleasure and welcome she has received.

Such hospitality as this comes so near the home life that it may be long sustained and frequent. The guest chamber should not long be empty. In winter, warm and cosy and bright; in summer fresh and cool; ministering to the bodily needs, yes, and to something higher.

The great empty rooms of a pretentious house are often swept and garnished for the abode of such evil spirits as pride and covetousness, coldness and self-absorption.

Fill them with cheerful human presences, and let them be glad with human voices, and how soon your own especial grievance or disappointment will have completely vanished away, lost among more unselfish and brighter thoughts.

We need one another for help and for pleasure and for mutual instruction, for it is in the world, not out of it, that character is formed and disciplined and the great battle of life is fought.

There is no working class more active, economical, self-denying and prudent than the French. They display their marked ability for practical business in the payment of their immense war debt, in the prosperity—notwithstanding the revolution after revolution and continued political disturbances—of their artisans and small farmers.

Nowhere does one see the abject squalor of the London poor, but the peasant children are warmly clothed and shod and suitably fed. Yet their working hours last long beyond ours, and every expense is carefully regulated and all superfluity avoided.

But no one in France is too poor for recreation after work is done. In the evening kinspeople, friends and neighbors meet together in a homely manner for a little music, perhaps a little reading or recitation, at any rate for a lively and friendly talk together.

No matter how many drop in, no expensive preparations are made; at the most, cake and tea, or something of the same light nature may be handed, but generally the guests come after supper.

The result of this is that the hardest and most untiring workers are never overworked. They rest each other, and bring together new ideas and smiling faces until the whole atmosphere is one of hopefulness and kindliness. Would it not be well for us to imitate their courtesy and cheerfulness, their unfailing hospitality? It is hard to measure the good that may be so given and received.

E. F. M.

A RAINY-DAY SKETCH.

I have become so much interested in the "Women's Department" that I've concluded to offer this random sketch hoping, that as it has been a pleasure to the writer, it may prove of some slight interest to the many lady readers of the Rural.

A sensational newspaper reporter would retire in lofty disgust from the unfruitful tranquility of "our town," indeed, the social animation of the place partakes so much of the tread-mill character that the fact of a quiet citizen having been knocked down by a big man in a slouch hat, and carrying a dark lantern has furnished sufficient material for two months talk, sufficient material, in fact, to make a first-class tale of horror for our grandchildren.

I must refrain from this style, or, some one may think it poor taste to write so lightly of my home, but too much amiability must not be expected of one who has been listening to the rain pouring down every night and drizzling down every day for three weeks, with a day or two thrown in for "good measure."

Some of my sisters may say that "some days must be dark and dreary!" but think of three weeks of dark days! My husband, who is a farmer in the embryo state, shakes his head gloomily and says he is afraid the wheat crop will be ruined, and my baby boy presses his wee face to the window and says "rain tum down, mamma."

While writing this, a letter has been handed to me from my bachelor brother in Florida, and he wishes he had a home so I could visit him. He thinks I would meet a different style of humanity from any I've ever encountered, and he also writes that in his neighborhood, they do not ask if a man is smart, but "is he progresssive?"

The weather there is certainly progressive for when he wrote the thermometer stood 90 degrees in the shade.

"Is that pretty hot, dear?" I asked my husband and he answers, "Yes, regular collar-melting weather."

Before closing I will mention a kind of reading club which we have organized. We have marshalled our forces, and I trust the fortunate members of reading clubs will wish us *bon voyage*.

Bradley Co. M. P.

Miss Lillie Carpenter, daughter of the senator, keeps in her parlor a spinning-wheel that belonged to her great-grandmother. She is distinguished in Washington as a vocalist, and when she sings her favorite song, she spins flax as an accompaniment.

Never tell people of several faults at once. You will profit them nothing, but discourage them greatly. Rather set their faults gradually before them, as you see that they have courage to bear the sight with advantage.

Domestic Economy.

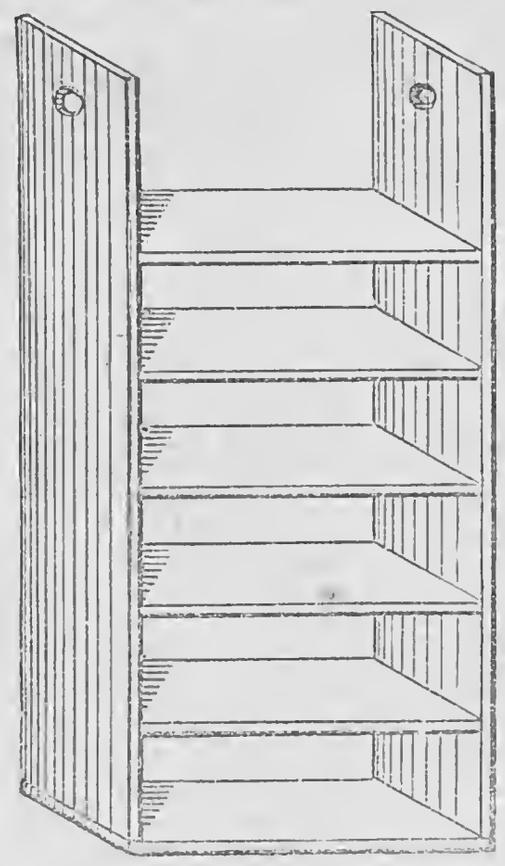
MOUSE-PROOF MILK-SHELVES.

MARY BEAL M'LOUTH

It's not any trouble to have mouse-proof milk-shelves where the ceiling of the cellar is plastered. When we began house-keeping in an old house, and found it impossible to keep a dish of sauce, butter or pie in the cellar without covering, not only on account of the mice, but the dirt sifting through the floor above, I devised a remedy for both difficulties, and hope my success will be of some benefit to others. The illustration will show how the shelves are first made. Two pieces of two-by-four are fastened across two joists, as far apart as the shelves are long, and a nail driven on



MOUSE-PROOF MILK-SHELVES.—FIG. 150.

the inside edge of one and the outside edge of the other, and the shelves hung up. Then they can be taken out in the sun to be cleaned and dried. Our cellar is so damp that I cannot use much water in it, or the boards will mold. Get some old pieces of sheet-iron, and nail them at the ends of the shelves over the four joists. Do not bend in too square corners, so that the mice can find a foot-hold, and if you leave any cracks under, drive in some splinters, and fill them up. Keep barrels and boxes at least four feet from the shelves, so that mice cannot jump on.

PEN-THOUGHTS FROM EVERY-DAY HOUSE.

MRS. ANNIE L. JACK.

There have been, for the last two weeks, signs of spring, that are becoming every day verified. April in this cold, northern country is a very treacherous month, not as in the British Isles distinguished by sunshine and shower, but by sunshine and frost—chilling winds and flurries of snow succeed genial days and sunny hours, all alike trying to vegetation. The Snowdrops have bloomed and faded; Hyacinths push their crowns of promise into the day-light, and the trees bud and take on a green tinge. But any sharp morning we may find them stiff, and be reminded that we live in ungenial Canada. Yet our climate has its advantage, and is bracing and invigorating to the strong, while as Whittier says:

"There's iron in our Northern winds
Our Pines are trees of healing."

House plants seem to feel the effects of air and sunshine; our little greenhouse, of which I have several times written to Rural readers, is a marvel of brightness and beauty, the Geraniums especially vying with each other in color and variety, nearly twenty different sorts being in blossom, besides many duplicates of the popular kinds—some of the choicest were Rural gifts, and as such are proudly pointed out to admiring friends. I suggested the other day to "our special artist," that it would be quite an improvement in plant growing if we had handsomer flower-pots. Why not decorate them as we do our china? that is, those used in a sitting-room; then, when in flower, they would be ornamental for table or side-board, robbing wintry days of half their dullness.

The housekeeping department is in its transition state. We took a fancy for muffins the other day, and the amateur cook tried several recipes; but, although each was pronounced good, they were not considered just "the thing." At last, by a happy thought, we experimented with Graham flour in this wise: one quart of Graham flour, one tablespoonful of sugar, a little salt, three teaspoonsful of baking powder, one egg and a pint of milk. The flour, salt and sugar were sifted together; the egg and milk beaten up as for custard and made into a good stiff batter. They were put into muffin pans, baked twenty minutes in a hot oven, and pronounced a success. Another form of muffin, excellent for tea, was made by taking two cupsful of cold, boiled rice, a pint of flour, a little salt, a teaspoonful of sugar, three eggs and a pint of milk with two teaspoonsful of baking powder. The rice is beaten free of lumps and the eggs and milk well mixed and stirred with the other ingredients. Make the batter rather stiff and bake as in the other receipe. These little varieties of bread at this season of the year are very agreeable, and more healthful than a steady diet of fine wheaten bread. And, while writing on these things, let me say to housekeepers that no article of kitchen utensils repays the buying better than a soapstone griddle for all kinds of pancakes. I have only had mine three years, but often wonder how we did so long without it.

DOMESTIC RECIPES.

Rhubarb Marmalade.

Wipe your rhubarb with a damp cloth, and cut in pieces as for a pie. When cut, to every quart of fruit allow three-quarters of a pound of sugar. Lay the sugar over the rhubarb in a vessel large enough to contain the juice and melted sugar, and let it stand over-night. In the morning, put it in a preserving kettle, and let it boil gently. Take one lemon for every two quarts of fruit, and, while the fruit is boiling, mince the rind very fine. Ten minutes before the marmalade is done, put in the rind and juice of the lemon in the proportion named. This is a very old recipe, and a great favorite with all.

Spiced Beef.

Take a piece of beef—flat ribs or brisket—and remove the bones with a sharp knife. Mix together with a little water one teaspoonful of mustard, one of salt, one of powdered celery seed, and a small quantity of mace and allspice. Spread the mixture over the beef where the bones have been removed, roll up tight, sew in a cloth, and place in boiling water. Boil with the meat four onions, two of them with a clove stuck in each, one carrot, and a small bunch of sweet herbs. A piece of meat from six to eight pounds' weight, will require boiling from three to four hours, according to thickness. It is better to leave the cloth on until the meat is quite cold. It is intended to be eaten cold

Peach Batter Pudding.

Drain the sirup from a quart can of peaches and lay the pieces in a buttered baking-dish. Make a *soft* batter of one quart of milk, four beaten eggs, a tablespoonful of melted butter, a little salt, two and a half cups of flour with two teaspoonsful of baking powder. Pour this mixture over the peaches and bake in a quick oven. Add sugar, butter, and flavoring to the peach sirup, boil up and serve with the pudding. Mrs. A. B.

QUESTIONS ANSWERED.

Cream Cakes.

Mrs. L. E. M. asks for directions for making cream cakes.

Ans.—Into a pint of warm water stir a half pound of butter; place over the fire until it boils, then put in three-quarters of a pound of flour, stir and boil one minute longer. Turn into a dish to cool. Beat the yelks and whites of six eggs separately, and beat the yelks, then

the whites into the cooled paste. Drop in large spoonsful upon buttered paper, not letting them touch, and bake in a quick oven for about ten minutes. They should puff up to thrice their orignal size. When cool, split open with a very sharp knife and fill with a cream made as follows: Reserve from one quart of milk enough to mix smooth four tablespoonsful of corn-starch. Bring the milk to the boiling point, then stir in the corn-starch. Add two beaten eggs, two cups of white sugar and a spoonful of butter. When cool, flavor with vanilla.

To keep eggs.

S. C., West Northfield, Mass., asks how to keep eggs for six months.

ANS.—We know of nothing better than to pack on end, cover with salt lime-water and keep in a cool place. Proportions, a pound of stone lime and a pint of salt to two gallons of pure water. Be sure that the eggs are perfectly fresh when packed, also be careful not to crack the shells.

RHEUMATISM comes from inactive kidneys. Hop Bitters never fails to cure it.

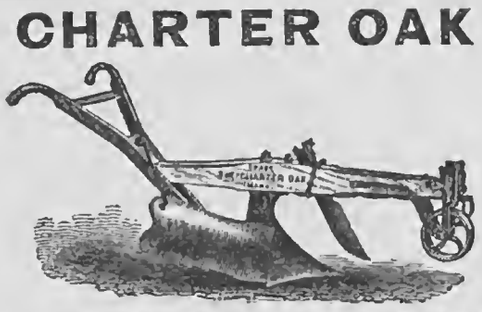
KEWANEE MF'G. CO., 35 Broadway, N. Y.

CHARTER OAK



SWIVEL PLOW.

THE ONLY PERFECT SWIVEL PLOW.

WALPOLE, N. H., April 13, 1878.

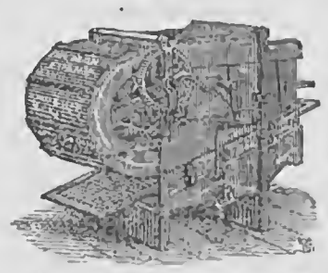
HIGGANUM MF'G CORP.:—You wanted to know how I liked the Charter Oak Swivel Plow No. 160. I would say that I have used it on all kinds of land, and think it the best plow I ever saw or used. I have used seven or eight different kinds of swivel plows and this beats them all in doing good work, and draws much easier I would not exchange it for any plow I ever saw.

Yours in haste, O. J. HUBBARD.

Manufactured only by

THE HIGGANUM MF'G CORPORATION.
Higganum, Ct.

The "Centennial" Fanning Mill.



The best mill in the world. It separates Oats, Cockle, and all foul stuff from wheat. Is also a perfect-cleaner of Flax, Timothy, Clover and all kinds of seeds. The great improvement over other mills is that it has two shoes. It is especially adapted for warehouse use. Send for Descriptive Circular and Price List. Liberal discount to dealers. Address,

S. FREEMAN & SON, Racine, Wis.

News of the Week.

MISCELLANEOUS.

Monday, May 3, 1880.

THE advancing civilization has brought the telephone to Alaska. A line is being laid by the Alaska Fur Company several miles in length. The natives have been told of it, but they cannot comprehend how people can speak through a wire.... The Kentucky Legislature lately passed an exceedingly stringent Sunday law providing for the punishment of all persons who work for pay on Sundays. The step was advocated by the Louisville papers and by a Citizens' League, of which a prominent clergyman was president. On the Sunday following the enactment, the police proceeded to enforce the new law by arresting the sexton and organist of the president's church, and the employees of the leading daily journal. 'Tis a pity the enactment should fit so badly, as some restraint was, no doubt, needed, but the law is doomed to fail ...Politicians of all shades are unusually busy just now, and their activity will increase with the approach of the presidential election. A number of conventions, both State and local, have been held in several States during the past week, for the selection of delegates to the national conventions. Instead of elucidating the pending mysteries of whom each party may nominate, every new convention seems to make "confusion worse confounded." At present it is impossible to forecast what men the two great parties will put in the field as opposing candidates. ....During the month of April the immigrants arriving at Castle Garden N. Y. numbered 45,274, which exceeds by nearly three thousand the highest number that has heretofore arrived in any one month, and the prospects are that there will be quite as many during May. The Immigration Commissioners are basing their estimates on a total of 350,000 for the year. The railroad companies are busy carrying the crowds westward....The nation is again at war with the Apache Indians, During the past month General Hatch's command has been in some severe engagements, and forced to make some exhaustive marching in prosecuting the campaign with the hostiles. Captain Carroll has been seriously wounded and some privates killed. The war scenes lie in Southern New Mexico and adjacent portions of Texas. Business had been almost paralyzed in this part of the country and the breaking up of this nest of thieving and murdering Apaches will be of immense benefit.

AGRICULTURAL NEWS.

THE English milk dealers in cities are still keeping up winter rates, as the supply is short.... During the three months ending with March 31, England imported 151,720,389 pounds of wool, valued at $41,565,677; of this vast amount, 105,575,062 pounds came from Australia... Three months of this year France sent to England only $20 worth of wheat instead of her usual heavy importations, while nothing whatever was received from Turkey or Roumania....Glanders is very prevalent among London horses....In the first quarter of this year England exported 934 horses valued at about three million dollars; last year for the same time the number was 778, and the year before only 415.... The English Derby, the horse race *par excellence* of the world, will, this year, be run for the last time at Epsom. In future it will be run near the mouth of the Thames, at Gravesend. The owner of the Epsom grounds is, on principle, opposed to horse-racing—and his principles are backboned by the fact that letting the land for villa residences will pay him better....In England the best American beef sells for 12c. per pound....Agricultural implements to the value of $2,933,388 were exported in '79, of which $393,978 were for mowers and reapers, and $159,822 for plows and cultivators....Australia headed the list of our customers with $664,756; then followed, in order, the United Kingdom, France, Germany, the Argentine Republic, Canada, the British possessions in Africa, Uruguay, Belgium, Mexico, Chili, Cuba, Porto Rico, Holland, the U. S. of Columbia closing the list with $21,086.. The following gives the imports of live animals into the United Kingdom for the last three years:

A Minn. hen has astonished the "natives" by laying 32 eggs in 16 days—it is said The South last year is said to have raised 600,000,000 pounds of tobacco—12,000,000 pounds more than ever before. ..Ga. has 6,864,654 acres of wild land, the average assessed value of which is 23 cents an acre....In six counties of Ky. the average value of land is less than $1 per acre, and in nine other counties it is less than $2 per acre. The whole State has 18¼ acres to each inhabitant....The heaviest crop of cotton on an acre, of which we have any record, was that reported by T. C. Warthen, of Washington Co., Ga., in 1873—6,891 pounds of seed cotton yielding 2,096 pounds of lint, or a little over four bales of 500 pounds each. The rows were three feet each way, with one stalk left in each hill, giving 4,900 stalks. Allowing 100 bolls to the pound each stalk must have had 140 bolls. He was competing for a premium offered by the Ga. Agr. Society....During the past year the Hudson Highlands and Catskill Mountains contributed 200,000 evergreen trees and 100,000 yards of evergreen roping, which was sold in New York city during the holdiday season....Seth Green, the great fish culturist, advocates frog culture. He says that a little care and cultivation will produce a crop of frogs large enough for family use, after supplying the market Away with prejudice!....The Congressional Committee on Ways and Means reported lately the following changes in the tariff: Salt and wood pulp to be put upon the free list; all cotton goods 30 per cent. ad valorem; flannels, blankets, wool hats, and woolen knit goods, thirty per cent. ad valorem; other woolen goods of finer texture, 40 per cent. ad valorem; iron steel rails, trace chains, anvils, hammers and all tools used by farmers, carpenters, and mechanics generally, one cent. per pound specific .. The British bovine aristocracy has suffered a grievous loss by the death of the eighth Duchess of Oneida, daughter of the tenth Duke of Thorndale. Her relatives on both sides of the Fish Pond belong to the best strain of the Bates' blood. Her untimely end was due to congestion of the liver....Rains put out the forest fires in New Jersey, which, it is calculated, swept over 600 square miles of country, burning hundreds of acres of timber, including the most valuable red cedar woods in the country, thousands of cords of wood, and doing an estimated damage of $60,000 to the cranberry bogs. On Friday last, however, they burst out again, licking up all the oak and pine that remained standing and still more grievously injuring the cranberry beds, besides destroying a number of farm houses, stables, etc.; altogether they have been exceedingly disastrous to the sections they ravaged..... Western Massachusetts tobacco growers who were enthusiastic about growing Havana, are said to have found that it doesn't pay, and this year they will grow more seed leaf....Massachusetts imprisons ordinary tramps in the House of Correction or work-house for not less than six months or more than two years. Any tramp that enters a dwelling-house without the consent of the owner, or threatens violence, or carries fire-arms or other dangerous weapon, gets not less than one year imprisonment and not more than five .. Connecticut and New Hampshire pay $5 reward for arresting a tramp and prosecuting him to conviction....Of 250 prisoners in the Massachusetts work-house, at Bridgewater, 100 are tramps....A plague of rats is seriously injuring crops in some parts of India, especially about Cawnpore; they cut down the growing grain, while the fatalistic natives look on helplessly, murmuring "*Kismet.*".... Saturday, April 24, the last day of the Dexter Park sale of Short-horns, 66 head were sold for $14,155; or an average of $214.32 per head. They were from Hamilton Bros., Flat Creek Farm, Mt. Sterling, Ky.,.....The Duke of Bedford have converted what was an inland sea in winter and a noxious swamp in summer, the waters expanding into meres swarming with fish and screaming with wild fowl, by the labors of successive generation of engineers into 680,000 acres of the richest land in England, as much the product of art as the kingdom of Holland, and like it, preserved for human culture and habitation solely by continuous watchfulness from day to day. The present Duke is devoted to agricultural pursuits, and has placed one of his best farms at the disposal of the Royal Agricultural Society for experiments destined to improve the scientific knowledge of farmers all over the world..... The Lord Mayor of London has received a telegram from the Christian Committee at Bagdad which says? "A terrible famine is raging throughout Mesopotamia and Kurdistan. Immense masses of starving Christians are crawling hither for relief. Our resources are totally inadequate to meet their necessities."

What Better Evidence

could the people ask to substantiate the merits of Dr. Pierce's Family Medicines than the fact that they have not only yearly grown in popular favor in this country, but the foreign demand for them has became so great as to necessitate the establishing a branch of the celebrated World's Dispensary in London, England, that these blessings to the afflicted may be dispatched from that greatest commercial center of the world to every country and people? Golden Medical Discovery is a concentrated, potent, alterative, or blood cleansing remedy, that wins golden opinions of all who use it for all humors from the common pimple, blotch, or eruption, to the formidable scrofulous swelling, Internal fever, soreness and ulceration, yield to its benign influence. Consumption, which is but a form of scrofulous affection of the lungs, may in its early stages be cured by a free use of this God given remedy. See article on consumption and its treatment in "Invalids' Guide Book"—10 cents post-paid. Address, World's Dispensary Medical Association, Buffalo, N. Y.

WORCESTER, Mass., Feb., 3rd 1879.

DR. R. V. PIERCE: Dear Sir:—With trembling hand from my extreme age, being eighty-five, I write to inform you of the great benefit your Golden Medical Discovery and Pellets have been to me. Three years ago I was prostrated with pneumonia; and no one thought I would recover. By the use of those medicines I was raished to health, and by the blessing of God and your medicines I have enjoyed pretty good health since, though for years before this I suffered from weak lungs and a bad cough. Gratefully yours, MARY B. FISK.

Premature Loss of the Hair, which is so common now-a-days, may be entirely prevented by the use of BURNETT'S COCOAINE.

BRONCHITIS.—Throat Diseases often commence with a Cold, Cough, or unusual exertion of the voice. These incipient symptoms are allayed by the use of "*Brown's Bronchial Troches*" which if neglected often result in a chronic disease of the throat.

A. B. BARNES, General Western Agent for Bradley & Co. has removed to Nos. 46 and 48 West Lake Street, Chicago, Ill.

The Robbins Washer and Bleacher.

Lately we had special reasons for thoroughly testing the character of the Robbins' Washer and Bleacher made by the Bissell M'f'g Co., 50 Barclay Street, New York. The test has been fully made for upwards of a month in the family at the Rural Farm, and has demonstrated the great merits of this machine. As in the case of hundreds of others, the first impression of the mistress of the house was that the old-time use of "elbow grease" was essential to the thorough cleansing of the soiled clothing; but repeated trials of this device have convinced her that this belief was due merely to immemorial usage, and had no real foundation in fact; for on every occasion in which it was used this washer did everything that is claimed for it in an entirely satisfactory manner. We can therefore unhesitatingly recommend it to all our readers who may be in need of a first-rate washer and bleacher.

The Markets.

SPECIALS FROM ALL CENTERS.

Until Saturday, May 1.

Baltimore.—WHEAT—Southern $1.14@1.15 for very common, $1.20@1.28 for inferior to fair red, and $1 30@1 35 for good to choice do.; Md. No. 1 red, at $1 29@1 31. For Western the market has declined quite sharply during the past week, and after a number of fluctuations the closing was firm at a trifle higher. No. 2 winter red spot and April at $1 22½@1 29½. May at 1 22@1 28½, June at 1 18¾@1 26, do July at $1 10¾@1 15½, and August at $1 08@1 10. Southern corn, offerings light. The sales range from 55½@55 cents for white and 50@52 cents for yellow. Western corn more than usually dull and prices irregular and unsettled, being firm for spot and easier for futures; mixed 48½@49¾ cents. OATS light and firm, with prices tending in holders' favor. Md. at 44 cents, Western at 41@41½ cents for mixed and 42 cents for bright, with the latter now held at 43 cents. RYE quiet and steady; good Western at 88 cents, and prime Md. at 90 cents. BUTTER—Strong demand for all the choice stock arriving, and the market is firm for all grades. New York Creamery at 21@23 cents; New York State new at 26@27 cents; Western new at 23@25 cents for choice and 20@22 cents for good to prime; Western rolls 22@24 cents for choice and 20@21 cents for good to prime and nearby stock 21@23 cents per lb for good to choice. CHEESE—A small lot of choice new has been received and is quoted at 15½ cents. New Western Factory is 12½@13 cents for choice and 11¾@12 cents for fair to good. EGGS—The receipts are liberal and the market is slow and easy at 10 cents per dozen for prime fresh stock. WOOL—The market generally is uncertain and feverish, especially in regard to the future. The stock is light and the new clip arriving is readily taken to supply manufacturers' wants, but there is no disposition to operate ahead. We quote good unwashed at 26@40 cents, tub-washed at 50@56 cents, pulled at 45@48 cents, and Merino at 35 cents per pound.

Chicago.—FLOUR dull; choice western springs at $5@5.50; Minnesota at $5.50@6.25; exports at $4.75@5.10. WHEAT active and firm. No. 2 Chicago spring at $1.12½@1.13¾ May; $1.11¾ June; $1.06 July; No. 3 do at 97c; rejected at 80@40c. CORN fairly active at 36¾@36½c. cash and May; 36½c. June; 36¾@36¾c. July; rejected at 34¾c. OATS fairly active at 29½c cash and May; 29¾c. June; 28¾c. July. RYE firm at 74¾@75c. BARLEY steady at 80c. PORK active at $10.05 cash and bid May; $10 20 June; $10 32½ July. LARD steady with a fair demand at 7c. bid cash and May; 7.05c. bid June; 7.10c. bid July. BULK MEATS quiet but steady; shoulders at 4.15c; short ribs at 6 30c. BUTTER—Demand moderate and supply light:—Choice to fancy creamery at 22@24c ₱ lb; fine to fancy dairy, nearly equal to creamery, 20@22c; good to choice dairy 17@18c; medium to fair do. 15@16c; common 13@14c; good to choice roll 15@17c; medium to fair do. 12@14c; common 10@11c; grease butter 6@8c. CHEESE—Trade fairly active; supply small. Prices rule steady and firm, choice to fine old cheddar creams at 14½@15c ₱ lb; fair to good new do. skimmed, at 10½@11c; flat skimmed at 9½@10½c, and common and sour stock at 6@7½c. EGGS—Market steady, under a moderate demand, at 8½@9c ₱ dozen, the inside for loose packages. HIDES AND PELTS:—Market dull; salted light hides 9½c ₱ lb; do. heavy cows, av. 60 lbs and over, 8½c; No. 2 or grubby and cut, all weights, 7½@7¾c; green salted bull 6½@6¾c; do. calf 14@14½c; dry salted hides 14@15c; dry flint 17c; dry calf 17c; deacons 55c. Sheep pelts are salable at 45c ₱ lb for the estimated amount of wool on each pelt. SEEDS—Timothy and clover firm: quote good to choice medium clover at $4@$4.30 ₱ bushel; mammoth do. at $4.25; fair to choice timothy at $2.40@$2.60; choice to fine Hungarian at 80@85c; millet at 80@90c, and flax at $1.40, on a basis of pure. HOGS—Market fairly active, packing at $4@$4.35, mainly at $4.20@$4.35; light $4.20@$4.50, chiefly at $4.40; choice heavy at $4.40@$4.60. CATTLE—Shipping firm with moderate offerings at $4@$4.80; butchers' steady at $2.35@$3.50; common at $2; stockers and feeders at $3@4. SHEEP—Market firm; wooled at $5.40@$5.60; clipped at $4.65 per cwt.

Cincinnati—BUTTER—There has been a further decline during the week of 2@3c perpound on all grades and a general improvement in quality which is equivalent to even more than this. The supple of Creamery is liberal and the bulk of the sales are now made at 25c for fancy; but 1c more is obtained for single packages. Some fine grass butter is now arriving, but with Creamery down to 25c it will not bring more than 22c and does not sell very readily at over 20c. The medium grades are worked off pretty well at proportionate prices, but packers have reduced their ultimatum to 12c. Butter ought to be all solid packed now, for roll is not wanted and goes to packers at low figures. Fancy Creamery sells at 25@26c, prime to choice do. at 23@24c, choice Western Reserve and Dairy 20@22c, prime Central Ohio 15@19c, medium do. 11@12½c and inferior 6@10c ₱ lb. CHEESE—The receipts have been short of the current demand, and the market is strong for prime to choice Northwestern factory at 11¾@12½c ₱ lb, and even new Ohio, none of which is fine, sells at 10@11c. EGGS—The receipts have fallen off and the market is firmer, with a fair local demand at 9@9½c ₱ dozen. HEMP—The market is quiet, with light receipts and only a moderate demand. Rough Kentucky sells at $100@$105 per ton on track, and $5@$10 more from store. Single dressed sells at 13@14c and double do. at 15c ₱ lb. HIDES—The arrivals are light and there is a good demand at full prices. Green hides bring 7@8c, green salted 8½@9½c, dry salted 13@14c and dry flint 15@17c ₱ lb. Sheep pelts sell at $1@$1.50 for prime to choice wool, and 25@50c for sheared. Damaged hides one-quarter to one-third less. SALT—The offerings are liberal and the demand is light. Ohio River, Kanawha and Michigan sells at $1.35 ₱ barrel of 280 lbs, delivered. Coarse Liverpool at $1.20@$1.30 per bag and Turk's Island at 45c per bushel. SEED—There is only a moderate consumptive demand but prices are well sustained. Clover is offered at 6¾@7c per lb and Timothy at $2.60@$2.70 per bushel. There is a fair demand for German and common Millet at 90@95c and Hungarian Grass at 95c@$1 per bushel. Dealers buy Flaxseed at $1.25@$1.30 per bushel.

Louisville.—FLOUR extra, $4; do. family, $4.50; A No. 1 at $5@5.25; choice fancy, $6@6.50 WHEAT steady at $1.05. CORN quiet; No. 2 white at 43c do mixed at 40c. OATS quiet No. 2 white at 36c. do mixed at 35c. RYE steady; No 2 at 82c. PORK dull at $11.50. LARD steady; prime steam at 7c. BULK MEATS firm; shoulders, 4½c; clear rib, 6.35c. clear sides, 65.7c. BACON firm; shoulders, 4¾c. clear ribs at 6.90c; clear sides at 7.40c. Sugar cured hams at 9½@10½c. BUTTER—Choice straight country packages are scarcer and hardly quotable. Creamery is a fraction lower. Other qualities quiet. We quote common to fair country at 14@18c. fair to prime at 18@22c. and choice to fancy at 24@25c; Western Reserve nominal, and Western creamery at 28@30c. FIELD SEED.—There is very little inquiry for anything but millet and Hungarian. We quote, delivered from store, German millet, 90c; Hugarian, 90c. FLAXSEED $1.10 per bushel on arrival.

Milwaukee—WHEAT opened firm, advanced 1-8c. and closed strong; No 1 Milwaukee hard at $1.16¼ do soft at $1.12¾; No. 2 Milwaukee at $1.09¾; No 3 do at 93c; No 4 do at 94½c; rejected at 89c. CORN steady, with a fair demand; No. 2 at 36½c. OATS in fair demand; No 2 at 29½c. RYE firmer, but scarce at 74½c. for No 1. BARLEY steady; No 2 spring at 65c. MESS PORK quiet at $10.10. LARD—Prime steam, 7c. HOGS quiet, but firm at $4.35@4.45.

St. Louis.—FLOUR dull; choice at $5; family at $4.85. WHEAT higher; No. 2 red fall at $1.12¾@$1,12 3-8; No. 3 do. at $1.09@$1.09 1-8; No. 4 do. at $1 bid. CORN higher at 33@33 1-8c. OATS firm at 30¾c. RYE easy@73¾. PORK firm at $10.25 bid LARD nominally 6¾c. HOGS easier; Yorkers at $4.25@4.35; bacon at $4.35@4.40; packing at $4 @4.25; butchers' to select at $4 40@4.55 CATTLE quiet and unchanged; sheep dull and nominal.

Philadelphia.—FLOUR—Western extras, $5; Minnesota extra medium $5.25; do. good at $5.50; do. choice at $5.75; do. fancy at $6@6 12½; Penn. do., fair, $5.50; do. good, $5 62½; do. do. choice, $5.75; Ohio do. good, $6; do. choice $6.15; Minnesota patents, fancy, $8.25 WHEAT —Market excited; No. 2 red May at $1.24 bid and $1.24¾ asked; June at $1.21¾ bid and $1.21¾ asked; July at $1 12¾ bid and $1 12¾ asked. CORN—Market was "cornered" for spot corn, and to cover contracts prices were forced up 1½@2c., but local lots were quiet, the inquiry being limited for consumption and export; Penn. western and yellow on track at 52@52¾c., chiefly at the latter rate; western mixed on track at 50¾c.; western rejected on track at 49c.; southern white on track at 52c. RYE steady; Penn. at 85c. OATS dull; No. 1 white at 45¾c.; No. 2 do. at 43½@44c.; No. 3 do. at 42½@43c.; mixed at 40@42½. PROVISIONS firm; city mess beef at $13; beef hams at $17; mess pork, car lots at $11.50@11.62½; extra prime at $9; smoked hams at 9½@10½c; do in salt and pickle at 7¾@9c; clear rib sides, smoked, at 7¾c.; do, in salt at 7c; shoulders in salt at 4½@4½c; do sugar pickled at 5@5½c; do smoked at 5@5½c; dressed hogs at 5¾@6½c LARD—Western at 7.62½c; do steam, loose, at 7.50c; do butchers' at 6¾c. BUTTER dull and weak; creamery extra at 27½@28c; Bradford county and New York extras at 24@25c; Western Reserve extra at 22@24c; do. good to choice at 18@21c; rolls dull; Penn. extras at 18@20c; Western Reserve extras at 19@21c. EGGS firm; Penn. at 11c; western at 10½c. CHEESE firm on account of scarcity; New York factory, at 14@14½c.; western full cream at 14c; do. good at 12@13c; do. half skims at 11@12c. LIVE POULTRY —Turkeys were scarce but not wanted, and old Chickens were in small supply but dull at 10@11c, as to quality. Winter Chickens were quoted at 17@20c., and spring do. at 20@25c. as to quality. SEEDS continue under neglect and wholly nominal. We quote Clover at 6½@7c., as to quality; Timothy at $3 for prime and Flax at $1.60. FEED was dull and unchanged, with light sales on a basis of $21 for winter bran to arrive and $21@22 for spring and winter do on the spot, as to quality. VEGETABLES—Potatoes—we quote Early Rose choice at 45c; some exceptional fancy lots at 47@48c; do fair to good, 38@43c; Snowflakes, 50@55c; Burbank's choice, 60@65c; Peachblows, 40@48c; York State Peerless at 30@40c; Penn. do at 20@30c; choice large well-assorted new at $5 ₱ barrel; fair to good do at $3@4; culls at $1.50@2.50. Florida new Cabbage at $3.75@4 ₱ barrel for choice and $3.25@3.50 for fair to good; Savannah and Charleston do at $3.50@4 ₱ crate; Norfolk do at $2@3, as to quality. Florida Beans at $2.50@2.75 ₱ crate for choice round; $1.75@2 for flat. Norfolk Peas, half-bbls., $1.50; North Carolina do, small half-bbl. boxes, $1.25; do., large, in half-bbl. boxes, $1.25; do. large, in half-bbl boxes, $1@1.25. Florida Cucumbers, $1.50@2 25 for fair to choice; do Tomatoes, good to choice, $3@5 ₱ crate for general receipts and $6@7 for Acme. Asparagus, $2@4 ₱ dozen. Florida Squashes, $1. 25@1.75 ₱ crate. Maryland Lettuce, $1.50@2 ₱ 100; Jersey choice do. at $4@5 ₱ 100; Radishes, 75c.@$1; Spinach, $1.50 ₱ bbl.; Rhubarb, $3 ₱ 100.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, May 1, 1880.

BEANS AND PEAS.—A liberation of recepts of beans has eased the market and prices are not named as strong as they were Still holders are not willing to sacrifice best marks of white beans and have not fallen off in demand. Green peas steady enough to use all receipts; quoted $1.80@1.85 for Wisconsin bbls. Southern B. E. peas unchanged at $1.90@2 ₱ 2 bu. bag. Marrow beans, prime, $1.70; other, $1.45@1 55; medium, prime, $1.40@1.45; other, $1.25@1.35; pea, $1.45@1.65; white kidney, $1.55@1.75; red kidney prime, $1.45@1.50; other, $1.25@1.35; black, $2.10@2.15.

Receipts for week, 7,400 bush.; exports, 575 pkgs.

BEESWAX.—There is very little doing, with prices unchanged. Sales at 24@25c. for Southern and Western.

BROOM CORN.—The dealings are small and prices without change. Nominal quotations are for choice brush at 7@8c.; choice hurl at 8c.; stalk bruid at 6@7c.; red and crooked at 3@4c.

BUTTER.—Prices declined to the present point early in the week and close quite steady, as the buyer have also considerable advantage in quality. Supplies are increasing and are mainly State. As before, half tubs and pails are making quite as satisfactory returns as creamery. Receipts from the West light. State Welsh begins to be quoted regularly.

New Butter—Creamery, choice, 25c.; good to prime, 23@25c.; fair to good 22@23c.; poor to fair 20@22c.; State, pails and tubs, choice, 23@23½c.; good to prime, 22@22½c.; fair to good, 21@22c.; poor to fair, 19@21c.; State, Welsh tubs, good to choice, 22@23c.; fair to good, 21@22c.; poor to fair, 19@21c.; Western imitation creamery, 20@22c.; do. dairy fresh, extra, 20c.; good to prime, 20@21c.; fair to good, 19@20c.; poor to fair, 17@19c.; do. factory extra, 21c.; prime, 20c.; fair to good, 18@19c.; poor to fair, 16@18c.; very poor, 12@13c.

Receipts for week, 23,850 pkgs.; exports, 5,312 do.

CHEESE.—The receipts have been larger and prices are easing up a little, with exporters very indifferent, expecting to see a still lower market when free arrivals set in. The exports for the week were 15,600 boxes.

New quoted at 14@14½c. for choice full cream; 13½@13¾c. for good and fine; 12½@13¾c for fair, and 10¾@11½c. for half skimmed.

Receipts for week, 14,825 boxes.
Exports, 12,000 do.
Liverpool cable, 74@75s.
Steam, 35s.

COTTON.—There has been a good business and the market closed firm at for May, 11,79@11.80c.; June, 11.83@11.89c.; July, 11.98@11.99c.; August, 12.06c.; September, 11.74c.; October, 12.14@12 15c.; November, 10.93@11c.; December, 10,97@10.99c.

DRIED FRUITS.—Apples have little demand, with prices unchanged. Peaches are quiet; small fruits are dull unchanged.

Quotations: N. C. apples, fair to good, at 7¼@8¼c.; choice, at 9@10c.; fancy at 10@10½c; Virginia, at 7@8c.; New York State quarters sliced at 7¼@8¼c.; patent evaporated, in cases, choice,. at 14½@15c.; good and prime at 13½@14c.; evaporated, choice sliced at 13@13¼c., and good do. at 12½@12½c. Evaporated peeled peaches, good to choice, at 27@28c.; North Carolina peeled, fancy, at 20c.; choice old at 17@18c.; Georgia prime at 16@17c.; fair to good at 14@15c.; common at 10@12c.; unpeeled halves at 7¼@8c.; do. quarters at 7@7½c. Pitted cherries at 17½@19c. Blackberries nominal at 11c. Raspberries at 27@28c. Plums at 17@18c.

Exports of dried apples since Jan. 1st 4,325 bbls,; do. last year, 18,933 do.

EGGS.—Receipts for week, 17,200 bbls.: do. last week, 17,675 do. Heavy receipts continue late and buyers have had another easy market. There is some accumulation of Western and the fact gives no strength to prices.

Near Points, 13c.; State and Penn., 11½@12c.; Western, fresh, 11½@11½c; Southern, 10½@11c.; off qualities or State, 10@10½c.; duck, 14@15c.; goose, 25@28c.

FLOUR.—The market has not shown much change this week, with trade moderate, and offerings liberal.

Latest prices are at $3.65@4.90 for inferior to very choice superfine State and Western; $4.60@4.85 for poor to good extra State, odd lots and lines; $4.85@5.25 for very good to fancy do.; $4.60@4.85 for inferior to good shipping extra Western, and $4.85@5.25 for good to fancy shipping extra do.; inferior to very good white wheat extras, $4.90@5.60; very good to fancy do. at $5.60@6.75; red and amber winter wheat, inferior to fancy trade and family, at $4.75@6.50; round hoop Ohio, $4.75@5 35; and trade and family brands of do, at $5.35@6.50; St. Louis at $4.75@5.60 for inferior to good extra; $5.60@6.75 for good to fancy; Minnesota clear, inferior to fancy, at $4.75@6 25; Minnesota "straight," inferior to fancy, at $5 15@7.25, and patent very inferior to fancy at $6.10@8.50; unsound stock at from $2 60@5.00; city mill extra at $5.60@6.00 for fair to fancy West Indies; do. for England, $4.65@5.25 for poor to very fancy; do. trade and family extras, $6.25@7.00; do. for South America, $6.00 @6.35; No. 2 at $2.70@4.00 for poor to very choice.

Receipts for week, flour, 74,847 bbls.; wheat, 770,889; corn, 1,133,159; oats, 302,855; grass seed, 2,958; rye, 17,000; barley, 15,400; malt, 11,518; beans, 7,332; cornmeal bbls., 3,753 cornmeal, bags, 912; rice, pkgs., 1,699.

Exports for week, wheat flour, bbl. 61,850; rye flour bbl. 40; cornmeal, pk. 3,375. wheat, bush. 1,266,332; corn, bush. 735,378; oats, bush. 1,902; beans, pkgs. 868; peas, bush. 10 133; rice, pkgs. 477.

CORN MEAL.—Sales at $2.25@3 for yellow, Western and $3,10@3.20 for Brandywine.

FRESH FRUITS.—Apples are nearly run out and lots rating only fair bring good prices. Baldwins, $3@4 25; Russets, $3@3,50; a few extra spy, $5. Norfolk strawberries show green picking. Prime N. C. and Chas. steady at 30@45c. Cranberries no longer quotable. Peanuts dull, but the demand will revive with better weather. Va. hand-picked 5½@6c.; extra prime, 5½@5½c.; good to prime, 4½@5c.; shelled, 5½@6c.

FURS AND SKINS.—The aggregate London sales of this year are reported as equal to $4,000,000. Market here dull.

GRAIN.—The market for wheat has been more active, and shows a very fair export movement, with prices closing strong: latest sales are of No. 1 white at $1.24@1 24½; do. May, at $1.23@1.23½; do., June at 1.21½; No. 3 white at $1.20; ungraded white at $1 20. No. 2 red at $1.27½@1.28½; do. May at $1.26½@1.27½; do. June at $1.24½@1.25½; ungraded red at $1.17@1.25; mixed winter at $1.24; No. 3 spring at $1.13@1.14; ungraded spring at $1.14@1.21. Corn is active, but closed weak with larger supplies; latest sales are of New York No. 2, at 52½@53c.; do., May, at 47@47½c.; do., June, at 47@47½c.; do., July, at 47½c.; New York steamer mixed at 52@52½c.; ungraded mixed Western at 51@53c.; No. 3 at 51@52c. Oats are offered more freely and closed weak with latest sales of No. 1 white 50c.; No. 2 white at 45c.; No. 3 white at 41½c.; New York No. 1 at 40c.; New York No. 2 at 39@40c.; No. 3 at 39c.; ungraded white Western at 42@43c.; ungraded mixed Western at 39@41½c.; white State at 48@50c.; mixed State at 41c.; No. 2 Chicago at 40c.

HAY AND STRAW.—Offerings are liberal, but prices about steady, as demand is fair.

Shipping hay quoted at 70c.; retail lots at 80@85c. for medium, and 85@$1, for better qualities; clover, 55@60. Straw at $16@1.05 for long rye; 65@70c. for short rye, and 50@65c. for oat.

Exports for week, 3,547 bales.

HOPS.—There is little trade, or only small lots taken, with prices essentially as last week. Quotations are for:

	Cents per lb.

J., good to prime, 13@14c.; State, good to prime, 12@14c.; Western, good to prime, 10@13c.; poor to fair, 6@10c. Ducks, Phila., 18@20c.; squabs, white, ₱ doz., $2.50; dark, $1@1.50.

Spring chickens in fair demand for good sizes, small ones not wanted. Fowl doing well.

Chickens, spring, large, per pair, 75c.@90c.; small, 40@60c.; fowls, Jersey, ₱ lb 13c.; Western, 12@13c.; roosters, old and young 6@7c.; turkeys, mixed, 12@13c.; ducks, Jersey, N. Y. & Pa., per pair, 75c.@$1; Western, 60@75c.; geese, Jersey, $1.50@1.75; N. Y. & Pa., $1.25@1.50; Western, mixed, $1@1.25; pigeons, 25@40c.

English snipe and plover are scarce and firm at $2.50 ₱ doz. Wild pigeons are low quality, however, is against them. A few Mich. squabs have sold at $1. Wild pigeons 75c. in good order.

PROVISIONS.—Hog products have been fairly active and showing little change in price; mess pork quoted at for May at $10.85; June at $10.90; July at $10.95, and August at $11.05. Bacon at 6¾ for long clear and 7¾ for short clear. Beef at for extra India mess at $18@20 for city and $19 for Philadelphia and at $10.50@11 for extra mess, and $10 for plain mess. Beef hams at $17.25@17.50. Tallow at 6 1-16 for prime. Stearine at 8c. for Western, and 8@8¼ for city. Lard—Western steam at 7.37½ for spot; 7.40 for June; 7.45 for July; 7.50 for August.

Receipts for week, pork, 6,750 bbs.; beef, 925 pkgs.; cut-meats, 45,300 pkgs; lard 24,625 pkgs. Exports for do., pork, 5,052 pkgs.; beef, 2,320 pkgs.; cut-meats, 11,734 359 lbs.; lard, 6,280,275 lbs.

SEED.—Timothy has a light trade, quoted at $2.50@2.55. Clover is moderately active; Western quoted at 6¾@7¾c., and State at 7@8c.

TOBACCO.—There has been little trade this week and prices have not shown important change.

VEGETABLES.—In old potatoes a slow business is still reported, and there is likely to be an important decline when sprouting time comes with warm weather. New have only a fair sale. A sample of Texas has reached New York. Exports of potatoes past week, 1,150 bbls.; since Jan. 1st, 62,875 do.; same time '79, 43,950 do.

Bermuda, new ₱ bbl., $5@6.50; Chas. & Sav., $3@4.50; Fla., $3@4.50; culls, $2@2.25; Early Rose, N. S., bulk, per bbl, $1.25@1.37; Maine, per d.-h. bbl., $1.50@@1.75; State $1.25@1.37; in bulk per bbl. $1@1.25; prolific Nova Scotia per bbl., $1.25@1.37; Peach-Peachblow, State, white, per d.-h. bbl., $1.50@1.62; red, $1.37@1.50; N. J. per bbl., $1@1.25; Snowflake, State, $1.50@1.62; Peerless, State, $1@$1.12; bulk, $1@1.12; Jersey, bulk, 50@75c.; Sweet potatoes, ₱ bbl., $2.50@2.75. There is the general inclination towards weaker prices for green stuff as the season advances. Peas are much lower. Oyster Bay asparagus is expected next week. Southern garden produce is in good demand, as restaurants and hotels are now using it steadily. Tomatoes, Florida, ₱ bu. cr. $2@4: Bermuda, ₱ box, 75@90c.; cucumbers, Fla., ₱ crate, $1@1,50; string beans, Sav. & Ch'n, $2.50@4; wax beans, Fla., $1@2.50; string beans, Fla., round, $1@2.50; do. flat, $1@2; squash, Florida, white, 75c.@$1; yellow per bbl., $1@1.25; green peas, Norfolk, per hf. bbl. crate, $1.75@2; North Carolina, hf. bbl. crate, 50c.@$1.25; asparagus, Jersey, per doz., bunches, $3.50@5; Md and Del., $4@5; Norfolk, $4@5; kale, L. I. ₱ bbl., $1; spinach, L. I., ₱ bbl. $1.75; turnips, Norf., new, ₱ 100 bunches, $2.00@4; do., beets, $6@8; do., radishes, 50c.@$1; squash, marrow, per bbl., $1.75@2; Hubbard $1.75@2; cauliflower, Ch'n and Sav., $6@8; Norf., $4; do. cabbage, $1@2.50; Ch'n and Sav., $2.50@3.50; Fla., new, $3@3.50; rhubarb, L. I. & Jy., ₱ 100 bunches, $2@3; onions Bermuda, new ₱ crate, $1.75@2; turnips, Russia, ₱ bbl., 75c.@$1.25; carrots, $1.50@1.75.

WOOL.—Demand has been slack, and prices rather weak on fine fleeces, with generally less confidence. Latest sales are of XX Ohio at 50c.; No. 1 do. at 54c.; unwashed Ohio at 32½c.; medium unwashed Wisconsin at 42c.; fall California at 23½@24½c.; new spring do. at 36c.; Oregon at 40@45c.; Virginia at 42c.; East India at 42@45c.; Cape at 35@37c.; Montevideo at 42c.; English combing at 55c.; 1,000 lbs. scoured East India at 54½c.

LIVE STOCK MARKETS

NEW YORK, Saturday, May 1, 1880.

BEEVES.—Receipts for week, 15,915 head; do. last week, 12,208do. There has been a very good market and the rather large offering for a spring week was well handled. The difference between Wednesday's prices and those of the close was only noticeable in some "giving away" of quality. A five-car lot of heavy corn-fed Colorados, was run out at about 9½c. to dress 56 lbs.; a load of fair Texas Stillers at 8¾c. to dress 56 lbs.; 23 cars of Illinois and Ohio Stillers, at 8¾@9¼c. to dress 57@56 lbs. The range for common to prime Corn-fed steers was from 8¼c.; to dress 55 lbs. to 10c. to dress 57 lbs.; 3 car-loads of distillery-fed bulls were sold at 4¼@4.15 ₱ 100 lbs. and a load of little State bulls at 3c. live-weight.

COWES AND CALVES.—Market very lightly supplied; common to fair, $25@40; good to prime, $45@55.

SHEEP AND LAMBS.—Receipts for week, 28,984 head; do. last week, 19,723 do. Supplies at the close were not heavy, but buyers had evidently supplied themselves liberally early in the week, and closing prices were weak and lower. Sheep were sold at 5@6c. for common to extra unshorn do. at $7.50@7.93½ ₱ 100 lbs.; spring lambs at 6½@10c. ₱ lb and $4@5.25 ₱ head. Dressed mutton declined more than ½c. ₱ lb, and was freely offered this afternoon at 9@9½c.

SWINE.—Receipts for week, 26,594 head; do. last week, 32,588 do. The expectation of light supplies has strengthened the market. Common to prime hogs, 4¾@5c.; city dressed, 6¼@6¾c. Pigs at 6¾c. Country dressed pork has almost ceased to arrive.

VEAL CALVES.—Live calves are easier with a fair demand. Hog-dressed calves have had another week of sales, but their time is shortening. We annex the Washington market and cattle yard rates:

Live calves, N. J. and Bucks Co., choice, 6¼@6½c.; prime, 5½@6c.; State, choice, 6c.; do. prime, 5@5½c.; fair to good, 4½@5c.; poor, 3½@4c.; Mt. Holly, good to choice, 6@7¼c.; buttermilk, 3@4c.; grass, 2½@3c.; calves, hog-dressed, Jersey, choice, 9c.; good to prime, 8@8½c.; State, good to prime, 7½@8c.; fair to good, 6½@7¼c.; poor to fair, 5@6¼c.

M. YOUNG'S

NEW GUIDE TO HORSE OWNERS.

Everything About a Horse Worth Knowing.

There is no one who Owns, Cares for or Works a Horse, who can afford to be without this work. It is just the handy, complete and Practical Manual that has long been needed by Horse Owners. It is written by a well-known Veterinary Surgeon and Horse Dealer of great experience, so that no matter of importance relating to the Horse in all its existence is neglected. This work thoroughly informs you about the Kind of Horse to Buy. To Detect Horse Jockey-Tricks. To Manage a Horse. To Shoe a Horse. To Break and Train Horses. To Cure all Kinds of Horse Diseases. There is nothing relating to Buying, Breeding, Rearing, Training, Shoeing, Feeding, Taming, Breaking and Doctoring Horses but is thoroughly detailed. In addition is given the **Art of Training and Taming Horses** by a New Method. And it tells—How to make a Horse Lie Down.—To Catch a Wild Horse.—To Teach a Horse to Pace.—To Make a Horse Stand.—To Make a Horse Sit on its Haunches.—To Make a Horse Come Down for Mounting.—To Make a Horse Follow you.—To Make a Horse Stand Still without Hitching.—To Break Horses to Ride.—To Prevent a Horse Running Away. Illustrated with Engravings.

It is invaluable when Horses are Attacked with Diseases requiring Prompt Attention, and in districts remote from Veterinary Surgeons, because it enables any one to Doctor their Own Horses. It gives the Best Rules for Telling the Age of a Horse, with a Fine Engraving showing the appearance of the Teeth at Each Year. Also, much other INFORMATION of great value to every Horse Owner. Actually worth as much as other Horse Books costing from five to ten dollars, but condensed so as to give all that is necessary to know, and **sent by mail post-paid on receipt of the price, 25 cents, or 5 copies to one address for $1.** Ask Four of your neighbors to buy one copy each, and thus get your Own Book Free.

AGENTS WANTED to canvass for this Valuable Book. It outsells all others. Sample Copy and Terms to Agents sent by mail, post-paid, **for 25 cents.** Address, **M. YOUNG, 173 Greenwich St., New-York.**

SONGS, One Cent Each

1	Baby Mine.	135	The Hallway Door.
4	Ella Ree.	137	Darling Beside of the Lea.
5	The Old Cabin Home.	138	The Kiss We Find the Door.
6	The Little Ones at Home.	139	I'll Remember You, Love, in My Prayers.
7	Old Black Joe.	141	Old Wooden Rocker.
12	See That My Grave's Kept Green.	142	Speak, Only Speak.
13	Grandfather's Clock.	143	Dancing Around with Charlie.
18	Where was Moses when the Light Went Out?	146	You May Look, but You Mustn't Touch.
22	Old Folks at Home—Swanee Ribbor.	147	My Daughter Julia.
23	You'll Remember Me.	150	There's Always a Seat in the Parlor for You.
31	I Dreamt I Dwelt in Marble Halls.	152	I've no Mother Now, I'm Weeping for You.
33	When You and I were Young, Maggie.	154	Nearer, My God, to Thee.
34	Cottage by the River Side.	158	Massa's in de Cold, Cold Ground.
35	We Parted by the Side.	159	Say a Kind Word When You Can.
36	When I Saw Sweet Nellie Home.	160	Cure for Scandal—Comic.
43	I Cannot Call Her Mother.	162	Strangers Yet.
48	Take this Letter to My Mother.	165	I Cannot Sing the Old Songs.
49	A Model Love Letter—Comic.	167	Waiting, My Darling, for Thee.
50	Female Stratagem—Comic.	170	I'm Lonely Since My Mother Died.
51	How to Kiss a Lady	172	Treating us for the Old Camp Ground.
53	Wife's Commandments—Comic.	174	Flirtation of the Whip—Comic.
54	Husband's Commandments—Comic.	175	The Slave's Dream.
56	Little Old Log Cabin in the Lane.	176	Don't You Go, Tommy, Don't Go.
64	Marching Through Georgia.	180	While We Have Missed You.
66	Widow in the Cottage by the Sea.	182	Over the Hills to the Poor House.
68	The Minstrel Boy.	185	Don't Be Angry with Me, Darling.
70	Take Back the Heart.	186	The Old Village School on the Green.
72	The Faded Coat of Blue.	191	Flirtation of the Fan—Comic.
74	Slavery Days.	194	Why Did She Leave Him?
76	Her Hair Shall Stand on the Steamboat Deck—Recitation.	196	Thou Hast Learned to Love Another.
77	My Old Kentucky Home, Good Night.	203	There's None Like a Mother, If Ever so Poor.
79	Thou Art so Near and Yet so Far.	204	You Were False, but I'll Forgive You.
80	The Sword of Bunker Hill.	208	Old Log Cabin in the Dell.
82	The Gray Hairs of My Mother.	209	Whisper Softly, Mother's Dying.
84	I'll be all Smiles To-Night, Love.	211	Will You Love Me When I'm Old?
86	Listen to the Mocking Bird.	213	Come into the Garden, Maud.
88	Her Bright Smile Haunts Me Still.	218	Where There's a Will There's a Way.
94	Sunday Night, When the Parlor's Full.	220	Annie Laurie.
95	The Gypsy's Warning.	222	Sherman's March to the Sea.
98	Swinging in the Lane.	223	Lamentation of James Rodgers.
102	The Girl I Left Behind Me.	224	Come, Birdie, Come.
104	The Girl I Left Behind Me.	225	Now I Lay Me Down to Sleep.
105	Little Buttercup.	226	Ever of Thee.
106	Carry Me Back to Old Virginny.	228	Love Among the Roses.
109	Kitty Wells.	230	Der Deitcher Gal.
110	Billy's Appeal to His Ma.	232	Old Arm Chair (as sung by Ned Barry).
112	The Old Man's Drunk Again.	239	The Sailor's Grave.
113	I Am Waiting, Ebby Dear.	242	Farmer's Daughters; or, Chickens in the Garden
115	Slight Hints—Comic.	243	Oh! Dem Golden Slippers.
118	Take Me Back to Home and Mother.	246	Poor, but a Gentleman Still.
120	Come, Sit by My Side, Little Darling.	249	Nobody's Darling but Mine.
121	Kiss Me, Mother, Kiss Your Darling.	251	Put My Little Shoes Away.
123	A Flower from Mother's Grave.	252	Darling Nellie Gray.
124	The Old Log Cabin on the Hill.	255	Little Brown Jug.
125	A Slave's Dream.	256	Ben Bolt.
126	The Skids are Out To-Day.	257	Good-bye, Sweetheart.
130	Coming Thro' the Rye.	260	Sadie Ray.
132	The Babies on Our Block.		
134	The Skidmore Fancy Ball.		

We will send ten of these Songs, your own selection, for 10 cents, fifty for 30 cents, and 100 for 60 cents, all post-paid, by mail. Remember, we will not send less than ten of these Songs by mail. Send one-cent or three-cent postage stamps. Order Songs by the numbers. **World Manufacturing Co., 122 Nassau St., New York.**
Valuable Catalogue of Songs and Agents' Goods mailed Free. Mention this paper.

$1000, REWARD

For any Washing Machine that will Wash Cleaner, Quicker, with Less Labor and Wear and Tear of Clothes than the

ROBBINS FAMILY WASHER AND BLEACHER, Pat'd Oct. 3, '71.

THE ORIGINAL AND ONLY PERFECT SELF-OPERATING WASHER IN THE WORLD.

No rubbing required. No more yellow clothes nor hard work on washing day. No more rubbing clothes full of holes. Seeing is believing, and if you will try 1 once you will never again wash without it, nor use any other washing machine. IT IS THE BEST IN THE WORLD, and will wash anything from a lace curtain to a horse blanket, and cannot get out of order.

GOOD AGENTS WANTED, BOTH MALE AND FEMALE, TO WHOM LIBERAL INDUCEMENTS ARE OFFERED.

AGENTS CAN MAKE FROM $10 TO $100 A WEEK.

THE ART OF CLEANSING FABRICS

is yet imperfectly understood by thousands of good housekeepers. The numerous devices of friction rollers, pounders, squeezers, dashers, agitators, steam wash-boilers, etc., have all failed in one or more of the three essential points, namely: the saving of labor, wear and tear of clothes, or in perfectly extracting the dirt and discoloration; all of which are accomplished by the ROBBINS FAMILY WASHER AND BLEACHER.

WHAT IS IT REMOVES THE DIRT?

You may ask washerwomen and housekeepers and your answer from nine out of ten will be "Plenty of elbow-grease," or in other words, laborious rubbing upon the wash-board. And such is the case, for you first rub soap upon the cloth, and then you have to *rub it in* to make the dirt soluble; but does that remove it? No; to do that you must dip it in the water and rub repeatedly to *force water* through the fabric, again and again. That is what removes dirt after having been softened by the chemical action of the soap.

The way in which this could be most economically accomplished has been developed in the FAMILY WASHER AND BLEACHER, which embodies all the above points.

Mechanical devices take the entire time of a person during the whole wash, and will not remove streaks from clothes. With the Washer and Bleacher washing, baking and housework are contemporaneous operations—the fire doing the washing and baking, while the housewife does her housework.

It is harder work to operate these *mechanical devices* than to use the common wash-board. They are constantly getting out of order, and wear out in a short time. They wear out clothes faster than the rubbing-board, because the friction is so much greater.

All who have tried steam wash-boilers will unite with us in saying: They do not give satisfaction.

WE WILL EXPLAIN WHY.

As stated, water force is what removes dirt from the fibre of the cloth. A large body of water is required to hold in solution a comparatively small amount of dirt. Steam wash-boilers cannot accomplish the desired result. They do not contain enough water to hold the dirt in solution. While steam will not remove dirt, it is a powerful agent to assist in cleansing, because it expands the fabric, and causes the discharge of dirt and impurities from the cloth that cannot be forced out in any other way, unless by the application of heat and force of water combined.

In order to remove the dirt from steamed clothes, they must be washed out in water at nearly boiling heat, for if you use water at a lower temperature it causes the fabric to contract, which "sets the dirt," thus causing the clothes to turn yellow. An essential thing to be mentioned is the rotting of clothes by steam wash-boilers, because of the small quantity of water used.

Everybody knows that a large quantity of soap dissolved in a small body of water must necessarily form an exceedingly strong alkali, which, after the clothes are packed in the steam wash-boiler, is converted into steam, every moment becoming more concentrated till the clothes are removed. A few such washings and what is the result? Simply this: Your clothes fall to pieces of their own weight, and you pronounce steam wash-boilers (as they are) a failure.

THE PRINCIPLE OF THE WASHER AND BLEACHER embodies all the essential points. First, we have the desired heat, which expands the fabric and causes it to discharge the dirt. Second, we obtain a powerful suction beneath the clothes, which produces a rapid downward current or water force, through and through them, thereby removing the dirt. Third, we use a large body of water, which holds the dirt in solution. Fourth, we use but a small quantity of soap. Fifth, the washing is done by water, and not by steam. This process cannot injure fabrics. It cleanses thoroughly, rinsing the clothes being all that is required to complete the operation.

THE PHILOSOPHY OF THE WASHER AND BLEACHER IS THIS:

We have 5 lbs. of metal, which attains a much greater degree of heat than the water surrounding it, consequently the water underneath the Washer becomes hotter, and more expansive than in any other part of the boiler, and thereby thrown to the surface through the tube thus tending to produce a vacuum underneath the Washer at the bottom of the boiler, into which the water is rapidly drawn.

As it passes along the channels of the Washer, the curved and contracted throats of which prevent its flowing backward, and being held in contact with the hot metal it becomes hotter and hotter, consequently more expansive and more forcible until thrown to the surface, thus producing a powerful suction beneath the clothes through which the water must pass in a rapid downward current, thereby obtaining a water force which cannot be obtained by any other method known in cleansing fabrics. Thus, we get a combination, FIRST, WE HAVE THE DESIRED HEAT, SECOND, PERFECT CHEMICAL ACTION OF THE SOAP. THIRD, FORCE OF WATER—ALL OF WHICH ARE REQUIRED TO THOROUGHLY CLEANSE AND PURIFY ANY FABRIC.

THE IMPROVED WASHER

has a perfect fitting pipe, and is a combination of metals which does not become sticky or dirty. It comes out of the boiler as bright as new.

A WORD ABOUT BLEACHING.

There are few professional bleachers in the United States. The word "bleaching" implies the art of extracting vegetable or animal matter and discoloration from the various fibres which constitute all our different fabrics. This is done by a regular chemical process, consisting, first, of alkaline boilings; second, immersions in solutions of chloride of lime; third, solutions of acids. After each process the goods receive a thorough rinsing in clear water, then last of all processes to thoroughly extract all injurious matter, comes that of boiling in good soap and water. This leaves the goods pure and white as snow, ready to finish for the market. Now the question arises, can those fabrics again absorb and fix all their natural discolorations? We answer no, impossible. Then why is it (asks the housewife) my clothes become yellow and discolored? There are many reasons—poor soap, hard water, careless servants, not having strength to rub out the dirt yourselves, and not being able to use water by hand hot enough to keep the fabric expanded to the extent which is absolutely requisite to thoroughly extract the dirt or "bleach the clothes." Clothes should never be bleached but once, but thoroughly washed, and they will always be white. THE FAMILY WASHER AND BLEACHER will do it for you every time.

THE CAPACITY OF THE WASHER AND BLEACHER.

There are two sizes: No. 1, the family size; No. 2, suitable for small hotels, restaurants, and barber-shops, boarding houses, etc.

The Washer is composed of metal and cannot get out of order.

The family size weighs about 5 lbs., and is only 8 inches long by 5 inches wide, and 1¾ in. deep.

The discharge pipe is 13 inches high over that, and is 1½ in. in diameter. It throws water in a solid, unbroken stream, at the rate of 6 to 8 gallons per minute. It will work in any flat-bottom boiler. It takes only 3 or 4 ounces of soap to 10 or 12 gallons of water, and will wash bed or table linen, a boiler full in 10 or 15 minutes, wearing apparel in from 10 to 30 minutes, and will remove streaks without rubbing; requires no previous preparation of the clothes, such as soaking over night. Take the clothes dry, and when the washer gets thoroughly at work, fill the boiler as full as it will hold by gently pressing them down with a stick. Use no chemical, only good soap and soft water. If the water is hard, it may be softened by a small piece of borax, which is harmless.

FOR LACE CURTAINS this Washer is invulnerable. It cleanses them as no other process can, and without the slightest danger of injury.

No. 3, or small hotel size, is 8½ in. long, 7¾ in. wide, 13½ in. deep, and weighs about 8 lbs. It will work in a flat bottom boiler, holding from 15 to 25 gallons, and wash of average pieces from 1,500 to 2,000 per day; or it may be used in any smaller boiler that has a flat bottom large enough for it to rest upon.

For hospitals this Washer is pronounced by the medical faculty invaluable, being the most powerful disinfector known; leaving the fabrics pure as when new. By Engineers, mechanics, and scientific men generally, it is pronounced one of the most wonderful discoveries in the principle of hydraulics or water force ever brought to light. By bleachers and chemists it is said to be the most powerful method of removing dirt and vegetable matter from fabrics ever known. It is the greatest bleacher extant, and for that alone is worth ten times the price.

THE INDUCEMENTS WE OFFER.

We want a Local Agent in every town in the United States. We know from experience that reliable, energetic men can make money selling the Washer and Bleacher in any community.

We want first-class men as GENERAL AGENTS; men capable of managing one or more counties.

To such we give a duly executed Certificate of Agency.

We furnish descriptive circulars for distribution among families. Also large posters for advertising in public places. Printed directions for using are sent with each Washer.

The retail price of No. 1 WASHER, in New York, is $3.50; No. 3 WASHER, $5.00; No. 1, $24.00 per dozen; No. 2, $36.00 per dozen.

SAMPLE, OR SINGLE WASHERS.

WE SEND SINGLE OR SAMPLE NO. 1 WASHERS, PREPAID, TO YOUR NEAREST RAILWAY EXPRESS OFFICE, in any part of the United States east of the Mississippi and Missouri Rivers, also in Kansas and Nebraska, for $3.50. West of that line as follows, viz.: In Dakota, at Bismarck or Yankton; in Wyoming, at Cheyenne; in Louisiana, at New Orleans; in Arkansas, at Little Rock and Texarkana; in Texas, at Denison or Sherman, for $3.50; in California, at San Francisco, Sacramento, Marysville and San Jose; in Colorado, at Denver and Pueblo, and in Utah, at Ogden, for $4; in Idaho, at Franklin City, and in Texas, at Corsicana, for $4.50; in New Mexico, at Santa Fe or Las Vegas, for $5; in Portland, Oregon, for $5.50. Our reason for so doing is to induce people to investigate this matter, feeling assured that a trial will secure an agent for us.

SPECIAL NOTICE.

As to the reliability of this Company, we refer you to the MERCANTILE NATIONAL BANK of this city, or to any Express Company in New York. Also to the Publishers of the following named well-known leading journals, viz.: NEW YORK—American Agriculturist, Weekly Sun, Weekly Times, Weekly Tribune, Weekly Witness, Weekly World, Christian Advocate, Christian at Work; BOSTON—Youth's Companion, American Cultivator, Chicago Inter-Ocean, Cincinnati Gazette, Toledo Blade, Springfield Farm & Fireside, St. Louis Journal of Agriculture, Detroit Free Press, all of whom have frequently editorially endorsed us as well as our Washer.

In ordering, write plainly your name, post-office, county and State. Also the name of the express office to which you wish the Washer forwarded.

CASH MUST ACCOMPANY ALL ORDERS.

Remit by Post Office Order or Registered Letter, at our risk. We insure the safe delivery of all Washers ordered as above. Money may also be sent by draft on New York. Send for a sample and secure A BUSINESS THAT WILL PAY YOU WELL. When you order or write mention this paper. Address

BISSELL MANUFACTURING CO.,
50 Barclay St., New York.

Reading for the Young.

REMINISCENCES OF A LITTLE GIRL.

MRS. M. J. GALPIN.

CHAPTER VII.

The Lakes of Killarney.

Upon arriving at the Lakes of Killarney Uncle Tom and his wife were deeply impressed with the view of the lovely waters, although but partially seen, and though tired and weary, they still toiled on to reach the town of Killarney, which is distant from the lakes about a mile from the north-eastern shore. It was a dilapidated withered-looking town, and although lords and earls lived in grand castles on the outskirts of the city, still it did not seem to help the "burg" very much. And how could it, when all the enlightenment and money were on the side of the rich? The poor might "scrabble" the best way they could. The town is overrun with beggars, and when the jaunting car that brings tourists to the lakes is seen, crowds of the poor miserable creatures flock around begging for alms. The Lakes of Killarney are composed of three lakes, upper, lower and Tore Lake. They really form but one lake as they are only divided by narrow channels. I find the following description of them which may prove interesting. The upper lake lies embosomed amidst the mountains, the others are situated at the outer base and are bounded only on one side by the mountains, while in the opposite direction they open upon a cultivated country, whose surface is dotted by numerous hills. The last two divisions of the lake are separated by a narrow peninsula, that of Muckross, and some small islands, Bricken and Dinas; the channel here is passable for boats. The upper lake lies three miles distant at the head of a navigable river, which flows through a romantic valley called the Long Range. Near the end of its course the river divides into two branches, one of which flows peacefully into the bay of Glena on the lower lake the other, forcing its way through a rocky channel empties with considerable impetuosity into the middle lake under the woods of Dinas Island. This river separates after passing the old Weir Bridge. Here are visible the different mountains surrounding the lakes. Among these mountains only Tore, Glena and Toomis rise from the lake, all the rest but surround them.

The hight of the seven mountains are as follows: Caru Tual, 3,414 ft., Mangerton, 2,756 ft., with the Devil's Punch Bowl; Tore, 1,764 ft., Eagle's Nest, 1,103 ft., Purple Mountain 2,739 ft., Toomies, 2,500 ft. The mountains that run directly from the water are clothed with verdure almost to the summit, and dotted with shrubs and forest trees of varied hue. The first thing that attracted the attention of the surveying party was the beauty and diversity of the foliage on the mountains and by the margin of the lakes. The Hawthorn grows here to an immense size, and when in blossom it seems as if the mountains were covered with snow, while the perfume is delightful. The Arbutus grows inwild luxuriance throughout Ireland, but seems to flourish with increased vigor around the lakes. Various toys are manufactured out of Arbutus wood, which gives employment and remuneration to a good many of the skillful poor, as they are always on hand to sell their curiosities to visitors and tourists at the lakes. Uncle Tom often said that one would have to see the Lakes of Killarney to appreciate their beauty and grandeur: for the combination of mountain scenery, with its ever changing shadows, and foliage of every hue reflected in the limpid waters unite to make them most delightful and seem to one like a gleam from Milton's Paradise Regained. If my readers would like a full description of these lakes, I would advise them to purchase a book "A Week at Killarney;" it is the most interesting book of travels I ever read. It was written by Mr. and Mrs. S. C. Hall. Uncle Tom gave me the book in 1850, and I have it yet, as Uncle has long since passed away to that land "where the wicked cease from troubling, and the weary are at rest."

It would occupy too much time to tell of all the sights and beauties of Killarney Lakes, but I will tell you about the famous echoes, and the noted O'Donaghue, who (so the legend runs) may be seen any bright May morning rising out of the lake, or riding into it on his famous steed.

Those who live in the East among mountains will understand all about echoes, but they are tenfold more beautiful on those lakes. Procuring a guide, who is also a bugler, the tourist embarks in a pleasure boat, and when far out on the lakes, the guide plays a tune on his bugle. As he ceases it may be heard repeated from the loudest forte to the faintest planissimo. Every note is perfectly reproduced to the ears of the delighted listeners, who can hardly believe but that some unseen musician lies hidden within the recesses of the surrounding mountains. There are various legends of the far-famed O'Donaghue, but this is the credited version of his origin. Long ages past O'Donaghue of Ross, was lord of the lakes, and the sworn foe to all oppression in any shape. He was just and generous, brave and hospitable, and after his mysterious disappearance he is supposed to come annually every May morning and revisit those lakes. He may be seen (so they say) gliding over the waters on his milk-white steed, which is richly caparisoned, while lovely youths and maidens precede him, strewing flowers along his pathway, and all around may be heard the softest, sweetest and most enchanting music. Happy the child of earth who is fortunate enough to obtain a glance at this far-famed O'Donaghue as he glides away o'er the rippling tide, for fortune and success are supposed to follow him all through a life long career.

I will now give you the legend of "O'Donaghue's pigs," and must then close this already too long chapter on the lakes and their interesting surroundings. And shure, did ye never hear of O'Donaghue's pigs? Such wonderful craythurs, so fat and handsome, more like cows, the wonder of the whole counthry they wor to be sure. Well, O'Donaghue was a little short of money (like a good many others in these days) and he says to his wife, "My darlin'" (for he was mighty fond of her always), "there is so much talk about those pigs I'll sell them." And she up and says, "Sell them, is it?" looking all kinds of ways at him. "Whisht," he replied, "and don't be after talkin' of what you don't understand. Keep to your parlor and lave the O'Donaghue to manage his pigs;" and he put a frown upon himself that would terrify the lake into a storm at any hour of the day or night. So he gets up and drives his pigs to market, and, shure, he was the wonder of the fair, seated on his snow-white horse, behind a flock of a hundred pigs. But you see, the pigs wouldn't be driven by any one but himself. The crowd around the pigs bought them all, and when he had sold them and buttoned up his money, he says to one, "Me good man, if you are discontented with your bargain just let me know, and I'll give ye yer money back." But the vagabond thought how soft the O'Donaghue was, for he knew he got the pigs for half their value. Now the home of O'Donaghue and the pig driver were in opposite directions, and it most broke the man's heart the uneasy way the pigs wandered, but when he thought of the fine bacon they'd make he went on, never heeding the trouble.

After two days' weary journey he came to a river ford, and if ever a bridge had been there it was washed away. The minute the pigs saw the water they dashed into it, and sure enough, every one of them turned into a green growing rush. There were his beautiful pigs with their broad bacon turned into green rushes. At first he set up an ullegawn (cry) that would shake the rocks, then he turned back to get his money from O'Donaghue. When he reached the castle, he knocked at the hall door with the Dane's hammer that hung there, and out comes the lady. "And what do ye want of me, good man?" she says. So he explained it to her, and then she says: "You must go up to the prince's bedside and shake him up, for he is asleep, and if that will not do, pull him by the foot." He did as he was bid, but could not wake him, so lifting up the golden quilt that covered him he pulled his foot, and just as sure as Mount Glena is darkening the water, foot, ankle, leg and thigh came off in his hand. Oh! how he blessed the O'Donaghue, the wrong way, as he stood holding the leg, while the prince still lay sleeping as sweetly as if the May breezes were blowing o'er him, so the man tucks the leg under the tail of his coat, and though he was trembling from head to foot, he walked past the lady as bold as a lion, and says, "thank yer honor, I've finished me business." He flew off like the wind, and the leg slipping from under his coat took to running before him. Whichever way he ran, it was before him, more than once he tried to make the sign of the cross, but he had no power. Sure, his feelings were not bettered when, on looking back, he saw the O'Donaghue coming after him. "Stop!" he cried, "ye beggarly pig-driver, what ails ye, that ye can't stop whin a gentleman speaks to ye. Give me my leg." "Shure, it ran away, sir; it's on before, sir," says the driver. "Where!" thundered out the prince, and the echoes from the Eagle's Nest to the Gap of Dunloe, shouted, "where!" "Oh!" laughed O'Donaghue, and the leg was in its right place again. "There," said the prince, throwing a purse toward him, "is your money, my pigs are at home again. I only wanted my turn at the Saxon's gold."

Marshall Co., Kan.

Dear Uncle Mark:—The other day I took down the Gladioli I received from you last year and it gave me such a lift of gratitude that I feel as if I must write to you, although I have not done anything for your column this winter. We have a little greenhouse that gives us great pleasure. It is very bright just now with flowers some of which came from the Rural, and are prized especially for that reason, as well as for their beauty. When the days are cold and dreary, we children call the greenhouse Italy, and sometimes I sit there with those very tantalizing seedsmen's catalogues, and dream of spring, and of our garden work. To-day it is snowing and blowing like—well—like March generally does in Canada, although the almanac says that next Saturday begins the spring. I wish it would come, though I have not yet decided what crop to venture upon this season. One of my sisters is attracted to try the pungent onion, and another makes a specialty of everlasting flowers. When I decide I will let you know how I prosper. Mamma told me all about meeting you in New York, and I am ambitious some day to see you myself. With kindest regards, Yours truly, Mary Jack.

Prov. Quebec, Canada.

The Puzzler.

Here is a new style of puzzle which offer the cousins an opportunity to show their ingenuity. The puzzle consists in combining the 168 words in the subjoined anecdote so that they will form another anecdote, containing the same words, but altogether different in sense. When the transformation is complete send the resulting anecdote to Uncle Mark who will publish a few of the most successful attempts. The cousins may think that the piece is too long, but its length is really an advantage as it gives a greater variety of words than a short one, and hence admits of being changed more effectually. It will prove a good exercise for the young grammarians.

During the late unpleasantness the Connecticut Fifth was at one time stationed at Kelly's Ford, Virginia, and while there received some recruits, among whom was Jones, an ideal Yankee. Jones was not familiar with fire-arms, and when posted as a sentinel for the first time, deliberately sat down and dissected his musket. While thus engaged, the officer of the day approached, expecting the usual recognition of his presence instead of which the sentinel continued his investigations. The officer was naturally indignant. "What are you here for, sir!" he demanded.

"Wa'al," was the reply, "I expect I'm a kind of a sort of a guard here. Who be you?"

"Wa'al," said the officer, imitating him, "I expect I'm a kind of a sort of an officer of the day here."

"Wa'al," replied Jones, "you jest hold on till I git this musket together, and I'll give you a klud of a sort of a s'lute."

Officer didn't wait, but went off admiring the vivacity of the American character.

HIDDEN TREES.

1. Metal I potted corn beef.
2. Asa go home at once.
3. Hand me the basket Talbot.
4. Hear the music in Namon's house.
5. Will you stay Ucca.
6. Do not be tell-tales.
7. I like beef steak.
8. I heard from Ed. Larsh last week.
9. Seta Camah accepts the situation.
10. Fristam a risk must be run.
11. I put Amar in Daisy's cottage.
12. I saw your mate Beb in the hall.
13. I met Lestur Pentine yesterday.
14. Philip, lumbago is in the back.

☞ Answer in two weeks. Little One.

CROSS WORD.

In England, not in France.
In vision, not in trance.
In obvious, not in plain.
In kernel, not in grain.
In gravel, not in sand.
In elbow, not in hand.
In slant, not in level.

The whole is a level.

BRIEFLETS.

"Little as is known" (says Dr. Hexamer in the N. Y. Tribune) "of the nature of scab in potatoes, I think I have proven, to my own satisfaction at least, that since the exclusive use of commercial fertilizers, my potatoes have become entirely free from scab, and better than with the use of barnyard manure. . . . Dr. Engelhardt calls attention to a fact that is too much overlooked, viz., that ice from impure water is unfit for drinking; that it may contain fever germs and that it is far better to cool pure water by placing the vessel containing it on ice than by using impure ice in the water. . . . Beurre d' Anjou, it should be remembered, is, among dwarf pears, one of the very best. . . . "Everybody is confident and courageous over the promise of abundant crops," says the Pacific Rural Press (California). . . Our readers must not forget that our address is now 34 Park Row. . . . We have found that repairing lawn mowers is a costly and generally unsatisfactory matter. The best way to repair a lawn-mower that does not do good work is to buy a new one. . The advertising columns of the Rural New-Yorker are at this time of unusual variety and interest. . . They should be looked over *every* week as well by those who have nothing to buy as by those who have. . . The "White Elephant"—but we cannot explain that yet. . . Grapes, Currants, Strawberries, Raspberries, Blackberries, Gooseberries, Apples and Pears should be raised on every farm. Farmers do themselves and their families injustice by neglecting their cultivation. . . Land and Home calls the Daniel O'Rourke a new pea! . . About the middle of May the first wash should be given to fruit trees. Then again about the middle of June. No care given to fruit trees pays better than this. . Ouray, the Ute chief, recently purchased one of Mosely and Stoddard's Cabinet Creamerics. The order was given while in Washington, from an advertisement in the Rural New-Yorker. . . Inquirers will find London Purple in our advertising columns. From all the information we can get, there seems little doubt that it will take the place of Paris-green . . . Quite delighted with Mr. Warner's book which we have been looking over at odd moments of late, we again quote from its lively pages. He is jubilating over the fact that he has just completed the first hoeing of his garden. "The only drawback," he says, "to this rejoicing is that the garden now wants hoeing the second time. I suppose if my garden were planted in a perfect circle, and I started round it with a hoe, I should never see an opportunity to rest. I had pictured myself sitting at eve, with my family, in the shade of twilight, contemplating a garden hoed. Alas! it is a dream not to be realized in this world. . .

CATALOGUES, ETC., RECEIVED.

Inter-Ocean is the the name of a new weekly journal, published at Denver, Col., and devoted to all the interests of that new and rising country. It is a neatly printed paper of 20 pages, and cover, and seems to be quite orginal in its make-up. Price $4.00 a year.

Transactions of the Department of Agriculture of the State of Illinois for 1878. This volume contains also a very full and interesting description of noxious and beneficial insects peculiar to the State, by Prof. Cyrus Thomas, State Entomologist.

Seventh Annual Report of the New Jersey State Board of Agriculture; also containing the Report of the New Jersey Horticultural Society. The whole work contains some 260 pages, and is bound in pamphlet form.

Twenty-first Annual Edition of the Sorgo Hand Book. A short treatise on the Chinese sugar cane, and the machinery used in the manufacture of sugar. Blymyer Manufacturing Co., Cincinnati, O.

Schedule of Prizes offered by the Mass. Hort. Society for the year 1880. The amount appropriated for prizes is $3,050. Robert Manning, Sec'y, Boston, Mass.

Production and Distribution of Cereals of the United States, by J. R. Dodge. An extract from the Report on the Internal Commerce of the United States.

Catalogue of Strawberries, Raspberries, Blackberries, Grapes, Currants, Gooseberries, Rhubarb and Asparagus, fruit and ornamental trees by William Parry, Cinnaminson, N. J.

Seventh Annual Report of the New Jersey State Board of Agriculture, for 1879; a book in paper cover, containing many interesting facts and figures.

Quarterly Report of the Kansas State Board of Agriculture for the quarter ending Dec. 31, 1879; 168 pages full of valuable information.

The Cotton Mills of South Carolina, their names, location, capacity and history, published by the Board of Agriculture of that State.

No. 1 of Vol. 4 of the American Veterinary Review, edited by Dr. A. Liautard, President of the American Veterinary College, New York City.

Rules and Premium List for the Horticultural Department of the Cincinnati Industrial Exposition to be held in the fall of 1880.

Circular of Italian Bees, Colonies, Comb foundation, Extractors, etc. Sold by H. H. Brown, Light Street, Columbia Co., Pa.

Proceedings of the 25th Annual meeting of the Western New York Horticultural Society. An interesting pamphlet of 150 pages.

Essay on Horticultural Progress, read before the New York Horticultural Society, March 9, 1880, by Peter Henderson.

American Enterprise, as viewed by the foreign press; a small pamphlet published by Howard Lockwood, 74 Duane St.

Proceedings of the Kentucky Horticultural Society, at its annual meeting, held at Shelbyville, Ky., Jan. 13-15, 1880.

Proceedings of the American Poultry Association at this Seventh Annual Meeting, held at Indianapolis, Ind., Jan. 1880.

Forty Years among Small Fruits, by William Parry, Cinnaminson, N. J.

Proceedings of the Portage County (O.) Horticultural Society for 1879.

PERSONAL ITEMS.

President Tyler's widow has become an inmate of a convent in Georgetown, D. C.

A picture of Beaconsfield in a Brighton, England, hop-window has just been labeled: "Reduced to £2 12s. 6d; formerly four guineas."

Secretary Sherman is breaking ground for a handsome house, to be built within a few doors of that he now occupies in Washington. He drives out almost every afternoon in one of the best appointed equipages in that city.

Mr. McKellar owns the actual Cape of Good Hope and much land adjoining, whereon he has a large ostrich farm. From ten pairs of full-grown birds, which one man may look after, an income of $10,000 to $15,000, is is said, may be reckoned on.

The King of Bavaria, it is reported, is to be married to his cousin, Princess Isabella, daughter of the late Prince Adalbert and the Princess Amelie Philippine Pilar, Infanta of Spain. The King is now thirty-five years old, and his future wife is seventeen.

Professor Silliman, of Yale College, has been on an exploring trip to New Mexico. He says that here is no reason in the world why those great plains, heretofore considered uninhabitable, should not be converted into fertile farms. Professor Silliman says of General Hatch, who is now fighting some of the New Mexican Indians, that "he is as brave as a lion and as wise as a fox."

"Profoundly Grateful to God."

"I have been using your Compound Oxygen Treatment," writes Judge S. L. Bryan, of Salem, Ill., "for nearly two months, *and am profoundly grateful to God* and you for the benefits derived from its use. I have been for more than thirty years a sufferer from nervous disorders. Overwork and sedentary habits as a college student brought me into difficulty. Later in life professional labors added dyspepsia to my nervous calamity, and I have been a great sufferer for many years. My sleep has been bad, and I have had much irregularity in the action of the heart. The gas has nearly *relieved the disturbed heart-action, and my sleep is becoming as sweet and protracted as in early life.* I shall always remember you with gratitude, and appreciate the blessings of a progressive investigation which brings such results. I think you may congratulate yourselves that you stand in the front of a new medical advance that is to effect *a permanent revolution in the treatment of disease.*" Our Treatise on Compound Oxygen, which contains the record of remarkable cures in chronic diseases, sent free. Address Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.

MINNESOTA CHIEF!

The Best Thresher on Wheels!

It is not a vibrator, neither is it an apron machine, but the best points of both are combined, with new and original features of its own. It is wonderfully simple in its arrangement. It is admirably perfect in its threshing and separating qualities. It saves all the grain, and cleans it ready for market. It runs easily, is constructed durably, is finished beautifully, is the most economical, least expensive, and altogether the most satisfactory machine in the market.

It will handle wet grain as well as dry. In threshing Flax and Timothy it has no equal, threshing and cleaning both as well, and nearly as rapidly, as wheat, and requires no change except the sieves. It has more square feet of separating and cleaning surface than any other machine made, and cannot be overloaded. It is both over and under blast at the same time.

Our clover hulling attachment is a new and very desirable feature. It does the business more rapidly and better than an exclusively clover hulling machine.

Separators of the various sizes fitted for Steam or Horse Power, as desired.

An Improved Pitts Power, an Improved Woodbury Power, and the Elward Equalizing Power, all mounted on four wheels, are manufactured by us, and are not surpassed by any in the market.

For Price-Lists and Circulars, address the manu'frs.

THE FERGUSON BUREAU CREAMERY.

Surpasses all others in quantity and quality of butter made. It secures matured and ripened cream, which makes butter of the best texture, flavor, and of unequaled keeping quality. It excludes flies, dust and odors; is constantly at the correct temperature (58° to 60°); has room for the cream and butter, and saves three-fourths the labor. It can be used with either ice or water, and both summer and winter.

THE FERGUSON CONCUSSION CHURN is the best. It combines scientific principles with the best labor saving devices. No thumps or paddles. Brings the butter in granular form, and secures the largest yield. Before buying any other Churn or Creamery, or any pans, or cans, send for large illustrated circular to THE FERGUSON M'F'G CO., Burlington, Vt. Reliable Agents Wanted.

Humorous.

ARABELLA (on her toes in a chair, clutching convulsively at her skirts)—"Oh, Bridget! A mouse! a mouse! Come and catch it, quick!" Bridget—"Sure, mum, there's no hurry. If this one gets away, I can catch plenty more for yer, mum."

A SHREWD little fellow lived with an uncle who barely afforded him the neeessaries of life. One day the two were out together and saw a very thin greyhound, and the man asked his nephew what made the dog so poor. "I expect he lives with his uncle," said the boy.

A MISTAKE.—An Irishman was accused of stealing a handkerchief of a fellow-traveler, but the owner, on finding it, apologized to Pat, and said that it was a mistake. "Arrah, me jewel," retorted Pat, "it was a two-sided mistake—you took me for a thaif, and I took you for a gintleman."

A LITTLE girl found a shelless egg under the currant bushes in the garden, and in a high state of exeitement brought it and showed it to her aunt, "See auntie," said she, "what I found under the currant bushes. And I know the old hen that laid it. I'm just going to put it back in the nest and make her finish it!"

"MY son," said a doting father, who was about taking his son into business, "what shall be the style of the new firm?" "Well, governor," said the one-and-twenty youth, looking up into the heavens to find an answer. "I don't know—but suppose we have it John H. Samplin & Father." The old gentleman was struek with the originality of the idea, but didn't adopt it.

The Foundation of Health.

Without a substratum, a foundation of vigor, there can be no true health. The puny and the weak have all sorts of aches and pains, not necessarily because they are positively diseased, but because the vital machinery hitches and halts for want of the impetus which abundant vitality would give it. The blood-enriching tonic, Hostetter's Stomach Bitters supplies deficient energy by enabling the stomach to perform its digestive functions actively and uninterruptedly. The result of this is the distribution of stores of vitality to the remotest parts of the system, an increase of muscular energy and the disappearance of those nervous symptoms which accompany and proceed from debility. Irregularity of the bowels, torpidity of the liver, rheumatic ailment and malarial fevers are prominent among the actual diseases eradicated by this signally efficacious medicine.

TAKING MEASURE.

Tailor (to stout customer.)—"Have the kindness to put your finger on this bit of tape, sir,—just here! *I'll be round in a minute!*"

STOCKBRIDGE MANURES
For 1880.

Some years ago the Stockbridge Manures were only known to a few farmers in the Connecticut Valley. Now they are so extensively used in different parts of the country as to require two large factories, one in New York and one in Boston to manufacture them. This increase shows what farmers think of good fertilizers, and is not only due to the fact that they are reliable, well-made, and high-grade manures, but also to the fact that farmers have

FOUND THEM PROFITABLE TO USE.

Now that corn, and other farm produce is bringing such good prices, we anticipate that farmers will invest still more largely in our fertilizers.

Besides the Stockbridge Manures, we manufacture several high-grade Phosphates, and deal in first-class chemicals of all kinds. Farmers who intend to use Fertilizers of any kind, should

Pomological.

LOQUAT—JAPAN PLUM. (ERIOBOTRYA JAPONICA.)

On a visit to Charleston, S. C., at the end of March, I saw a very fine tree of the above species, loaded with fruit just then beginning to ripen. The tree was some 12 to 15 feet high, with large, spreading branches, and the limbs were bending under their burthen of fruit. The exceptionally mild winter had been favorable, and no extreme of cold had injured the young yield.

The Loquat, or Japan Plum, is an importation from Japan, said to have been introduced by Commodore Perry's Expedition—another contribution from that prolific source of so many of our useful and ornamental plants. It is now propagated throughout the Southern States, and is valued not only as one of the most ornamental of our broad-leaved evergreens, but also for its fruit. The tree blooms in November, and the young fruit is thus exposed to the cold of the winter. In New Orleans, Texas and along the Gulf Coast the fruit is rarely injured and is a marketable object in the large cities.

As far north as this latitude, it can only be used as an ornamental evergreen, except in Charleston, where, protected from cold winds and from severe frosts by proximity to the sea, it occasionally escapes. The fruit when ripe is of a bright golden yellow, or orange color, oval in shape, from one to one-and-a-half inch in length and nearly an inch in diameter, fleshy and well flavored, with a single large seed. It belongs to the natural order Rosaceæ.

Aiken, S. C. H. W. RAVENEL.

[The specimen from which our engraving was drawn was presented to one of our editors during a late visit to Aiken, by Mr. Ravenel. —EDS.]

Educational Notes.

WESTERN FARMING.—V.

W. I. CHAMBERLAIN.

Our Agricultural Colleges.

It may not be out of place in this series of articles, whose object is to learn what we can from a comparison of the agriculture of different sections of our country, to study in the same way some of our schools of agriculture. If we, in one State, can learn anything from these schools in other States, we shall be the gainers.

Agricultural Colleges are not peculiar to the West, though the oldest and one of the best is in the West, and I propose to compare our own younger Ohio institution with this older one in Michigan, to see what we may learn from the comparison.

The Michigan school is, beyond question, as its name indicates, an *Agricultural* College. Agriculture is the "objective point" there. It is "the thing" in that school for the students to become farmers after graduation, and, in point of fact, just about one-half of all its graduates during the nineteen years of its existence, have made agriculture or horticulture their calling, and most of the other half have gone to the "mechanic arts." How different this is from the results in our ordinary universities and literary and scientific colleges, may be seen from very careful statistics which show that only one-and-a-half per cent. of their graduates become farmers.

Our State agricultural schools are alike in this, that their funds come chiefly from the land grants of the General Government. But Ohio and Michigan seem to have understood those grants quite differently. The law of Congress "donating public lands to the several States and Territories which may provide colleges for the benefit of agriculture and the mechanic arts," provides that the interest of the fund arising from the sale of such lands "shall be inviolably appropriated * * * * to the endowment, support and maintenance of at least one college (in each State) where *the leading object* shall be, without excluding other scientific and classical studies, and including military tactics, to teach such branches of learning as are *relative* to *agriculture* and the mechanic arts, in such manner as the Legislatures may respectively prescribe, in order to promote the liberal and practical education of the *industrial classes* in the several pursuits and professions of life."

Now, the Michigan Legislature understood this to put agriculture first in importance; and the State law of 1861, submitted by a farmer, named the new school "The State Agricultural College," and declared that the new design of the institution, in accordance with the Congressional law, "is to afford thorough instruction in agriculture and the natural sciences connected therewith." And that "the institution shall combine physical with intellectual education, and shall be a high seminary of learning in which the graduate of the common school can commence, pursue and finish a course of study terminating in thorough theoretic and practical instruction in those sciences and arts which bear directly upon agriculture and *kindred industrial* pursuits." And among other studies specified, the law declares that the institution shall teach "especially the application of science and *the mechanic arts* to practical agriculture in the field.

The Michigan Legislature, Board of Agriculture, and Faculty of the College seem to have thought and argued in the matter very much as farmers everywhere naturally will argue

JAPAN PLUM—Loquat. (Eriobotrya Japonica.)—From Life.—Fig. 151.

viz.: When Congress gave a part of the public domain, of the farm of the nation, it was to improve the rest of it and those who till it, just as a farmer sells a part of his farm to get funds to drain or otherwise improve the rest. The schools built on these land-grants should, therefore, be, first and foremost, schools of agriculture. We have universities and excellent denominational colleges and scientific and technological schools all over the land, to train young men for the learned professions, for business, commerce, arts, civil engineering and the like, and their graduates have almost exclusively been absorbed by those professions and callings. But there are absolutely no schools, except the agricultural colleges, to train men to become really scientific farmers, and to raise the pursuit of agriculture from an illiberal and degrading labor up to a liberal profession, and make the farmer, not a mere plodder, but an intelligent man and good citizen.

Now, the Michigan school has been all the while conducted on this plan: chemistry, botany, geology, zoology, physiology, anatomy, and other kindred sciences are taught with special reference to their bearings on agriculture. Greenhouses, gardens, orchards, farms, stock and all farm crops and work are so arranged and planned as to give clear scientific knowledge of, and thorough practical training in, every process and detail of nearly all kinds of agriculture and horticulture. The chemical and botanical laboratories are so arranged as to give each individual student a working acquaintance with those studies and their bearings on agriculture. Not only that, but, proceeding on the theory that the farmer is a worker, and that entire separation and freedom from physical labor during the four years of college life, would tend to create a distaste for labor among students, labor is made a part of the curriculum. The students, under the professors or competent foremen, spend three hours daily, in fair weather, working in greenhouse, or garden, or orchard, or stock yard, or field. Thus study and practice go hand in hand, training young men to be practical as well as scientific farmers, and all the time this excellent out-door exercise is helping to build up rugged constitutions, instead of undermining them, as study alone is apt to do, especially in the case of those accustomed to active out-door labor. And to further this idea, the long vacation comes in winter when profitable farm labor is almost impossible.

Again, in order to bring the results of scientific knowledge and experiment within the reach, not only of the sons of farmers, but of as many of the present farmers of the State as possible, a number of Farmers' Institutes are held each winter in different parts of the State, conducted, in part at least, by members of the Faculty, and largely attended by the farmers. No wonder the Michigan Agricultural College is each year growing in the affections of the intelligent farmers of the State. No wonder they deem it, in most respects, the model institution of its class in all our land.

Now, in Ohio the idea is quite different. At first, indeed, the institution was called "The Agricultural *and Mechanical* College," but soon it began to be felt that this title was far too limited, and it was accordingly changed by the Legislature to "The Ohio State *University*," with no special mention of, or partiality to, agriculture, but almost the reverse. We have not in Ohio, it is true, any great university like the most excellent one at Ann Arbor, Michigan, but we have many excellent colleges of liberal private endowments, and more than 50 years' *prestige*, that are doing, in the aggregate, the full work of the largest university. Such institutions are Marietta, Denison, Kenyon, Western Reserve, and Oberlin colleges, with an attendance at each of from one or two hundred to a thousand. And there are several younger but most flourishing colleges or universities of private endowment. These institutions are doing the work well of educating young men in the classics and in the sciences for the various liberal professions and higher callings in life. Recently, too, the most munificent bequest of a million and a quarter dollars' worth of rapidly appreciating property, in Cleveland, by the late Leonard Case, to establish an institution to be known as the "Case School of Applied Sciences," seems to render still less necessary the existence of another "university" in our midst, built, as the Columbus one was, on a State and National endowment given, primarily, in the interests of agriculture.

In point of fact, too, agriculture has a most subordinate position in our "university," scarcely a dozen out of the two hundred students being really in the agricultural course. The Professor of Agriculture, a most able and excellent man for the place, is bending all his energies to the work of his department. But it is only *a department*, and seems not to be the favorite one of the Legislature or Board of Trustees—seems, I say, for my impressions here may be incorrect; but the appropriation and the general tide of sentiment at the institution seem to indicate it. It is not "the thing" at the University, to study agriculture. Farm labor is at a discount. It is not *a part of* even the agricultural course. Farm labor is furnished and paid for, to those who need it to eke out slender means, but simply as a business arrangement. There are no greenhouses, or gardens, or orchards, or plats for small fruit culture, for practical instruction in botany, horticulture, floriculture and pomology, and even the farm is by necessity managed on paying business principles, and not in any sense as an experiment station for the solution of problems in breeding, feeding, testing new seeds and plants, and new methods, or fertilizers, or deciding any of those questions that require accuracy and skill and *money* for their correct solution, and that individual farmers could not afford to solve, even if they were otherwise fitted. And yet it is expected that the college farm *will* do this work, furnish labor for students and show a clean balance sheet of profits. Mr. Thorne, the excellent superintendent of the farm, feels keenly the injustice and incompatibility of such expectations. He must keep a show farm and barns, too, always on exhibition to all visitors; and this in itself is no little burden and expense. It is even in serious doubt whether the Legislature will vote the moderate sum of $5,000 for the establishment of an experiment station, with greenhouses and equipments, to enable the Professor of Agriculture and the Farm Superintendent to do the very work demanded by the farmers of the State.

Another point, too:—Acting on a different theory as to which is "Mahomet" and which is the "mountain" and which can more easily be made to "come" to the other in our modern miracle, instead of professors holding Institutes in different parts of the State, as in Michigan, the farmers are invited to an annual course of lectures at the university for two weeks in January. This course is thoroughly admirable, but only about a hundred farmers thus far have attended each year. It is hoped, however, that a much larger number will attend in future, and it is quite possible that the Ohio plan may prove as wise on this point as the plan in Michigan.

But from the whole outlook in Ohio, it is not surprising that many intelligent farmers begin to feel that we are in serious danger of losing our *Agricultural* College. And if we do, it will be the old Scriptural parable of Nathan, in regard to David and Uriah. The rich king will have "spared" the many "lambs" of his own numerous flocks, and taken our "one ewe lamb"—our one hope of a more liberal education for farmers and mechanics. Science and Literature, intrenched in more than a score of excellent colleges and universities in our State, in the interests of the liberal professions and more lucrative callings will have laid their hands on *our one school* and swerved it over to the same interests. Perhaps the farmers of the State will take a more stalwart view, however, and say "Agriculture feeds the State and furnishes her revenues, and agriculture will hold in her own right the institution founded on the agricultural resources of the nation, and intended for the elevation of agriculture in our State." If they take that view, our legislature will soon know and feel it, and act accordingly. And the same question is yet to be decided in many other States—whether our Agricultural Colleges shall be such both in name and in fact.

Farm Topics.

VALUE OF LEACHED ASHES.

T. H. HOSKINS, M. D.

I HAVE read Prof. Storer's article on the value of leached ashes (RURAL, p. 262) with much interest. Living in a region of country where ashes, leached and unleached, are to be bought cheaply and abundantly, and yet where there are many farms (of which mine is one) where they have perhaps as much value for fertilization as in southern New England, I have naturally been much interested in the subject. When I came into possession of my farm, 14 years ago, it had been "potatoed to death," like many another farm in Vermont. From a yield of 300 to 400 bushels of potatoes per acre it had in 30 years' use declined so that, even with a moderate dressing of manure, 80 to 100 bushels were a maximum crop. The land was what is so often called "run out," and gave only meager crops of grass and grain with the ordinary tillage. The soil is a light loam, but not strictly sandy. It is part of a large flat on the east shore of Lake Memphramagog, and was once undoubtedly lake bottom, the old beaches showing along the flanks of the hills 100 feet higher. Boring for water 38 feet, I have found it composed for that depth of alternate irregular layers of sand and clay, and clay is often turned up here and there with the plow, though there is no "hard-pan," except in occasional spots of small area.

Not believing that 30 years' use had utterly destroyed the value of a once very fertile farm, I concluded that growing potatoes for market year after year during that time, had probably exhausted the store of available potash; and, acting on that idea, in three years I made it again give crops of 400 bushels to the acre, much to the surprise of my neighbors, who said potatoes could not be made to pay there. In the same time the grass product was raised from one ton on four acres up to over two tons on one acre. All this was done by the free application of unleached ashes, part of it from fire-wood, part from a steam mill where spruce saw-dust was burned under the boilers, and part from a bark-extract factory where spent hemlock tan was used for generating steam. In three years I had applied over 100 bushels to the acre, and had as good land as anybody in the county. The whole expense was not over $15 per acre, well returned in crops, and leaving the land in a condition, as shown by these same crops and acknowledged by "the neighbors," that raised its salable value not less than $30 per acre. Not a dollar's worth of stable manure was used, and no other fertilizers were employed besides the ashes, except about $8 worth of ammoniated superphosphate per acre upon corn and potatoes, each year. When seeded to grass the growth was fully equal, by the testimony of early settlers, to the growth when the land was new.

So much for *unleached* ashes. I have also used a good deal of leached ashes, which work very differently. They are excellent for clover, and especially, for white clover, "bringing it in," and making a thick mat of it where very few plants could be found before. It proves a better application to a young orchard than unleached ashes, giving a thrifty, healthy growth, not so sappy and rank as when manure is used, or where raw ground bone and unleached ashes are applied, having been first mixed and wet down in a heap for three or four weeks before using. This compost is a "jumper" used in the nursery or on Grapevines, in the garden and upon grain, and pays well when pure ground bone can be had for $40 or less per ton. Leached ashes are not to be compared to unleached for potatoes or for grass proper, excluding the clovers. They are not nearly so good for corn or grain. For these purposes (looking to prompt returns rather than permanent value), leached ashes are not (with me) worth one quarter as much as the unleached.

Now for lime. This is a limestone country, there being extensive quarries where lime is burned on the next point north of me on the lake shore. Lime used in the way advised by Professor Storer, is utterly useless and worse than useless on my land. On the clay farms around the lake it works very well, improves the grass and benefits the hoed crops and grain. But on the light loams it "burns everything up," makes the grain rust and kills out the grass: this, whether used at the rate of one load or ten loads to the acre. I think, therefore, that we must attribute the usefulness of leached ashes to other constituents than the lime. I have long thought that we have not given enough importance to magnesia as a plant food that needs to be artificially supplied on some soils—not in large quantities, indeed, yet none the less needed. And may it not be that the magnesia in leached ashes accounts for some of its good effects? Also, may not dolomitic limestone (which ours is not) be worth more as a fertilizer for the same reason? I have experimented "some" with sulphate of magnesia in my composts, and have believed that I saw good results from its use.

Orleans Co., Vt.

LONDON PURPLE.

So far as we can ascertain, this insecticide is destined to take the place of Paris-green entirely, and there are many cogent reasons why it should. The color is a bright purple and it can therefore readily be detected upon the green leaves. It will adhere to the leaves also, so that a smaller quantity suffices. It is only a little over half the weight of Paris-green, so that the same weight will go twice as far. It is far less dangerous to human life, and its cheapness insures it, in a great measure, against adulteration. Professor Cook says that it can be put in the market at ten cents, or less, per pound, and that he has found one pound of the poison sufficient for 100 gallons of water. He also says—and this we have stated before—that it is more diffusive than Paris-green, and, therefore, needs less stirring to keep it well mixed with the water. It is death to the potato beetle, cotton worm and, in short, to all leaf-eating insects. We are in receipt of pamphlets from the manufacturers, Hemingway's London Purple Co., 90 Water St., New York, which tell the whole story and present testimonials from eminent horticulturists and experts whose testimony cannot be doubted. Our readers will please send for circulars which will be forwarded free, and which will fully answer any questions which may suggest themselves.

RECLAMATION OF BOG LAND.—The article on page 101 of the RURAL is an interesting one, but the method of reclaiming such lands could not be followed in the United States, so long as manual labor rules as high as at the present day. It is something like the finishing process of cranberry bogs, as practiced in New Jersey previous to setting the plants. These cranberry bogs, or, more properly, plantations, are usually formed from cedar swamps. They are first drained, the timber then cut off, the roots of the trees grubbed out, and the surface leveled. Sand or gravel banks line these swamps, and their soil is carted or wheeled in hand-barrows on to them to the depth required, and then they are set with the cranberry plants. The soil of these swamps is a rich muck of one to several feet deep. If thoroughly drained, plowed, seeded to grass and limed, they would make rich meadows, but till cranberries began to be attacked by insects, the scald, &c., they were much the most profitable crop that could be cultivated.

Floricultural.

PLANS FOR GEOMETRICAL FLOWER GARDENS.

JAMES HOGG.

THE geometric style of laying out a flower garden is not only the most ancient, but is also the most capable of producing, within specified limits, beautiful and artistic effects. It also harmonizes better with the dwelling-house, as it can be made, in skillful hands, to partake of its architectural character. It is especially adapted for small places in this country, as here we have such a superabundance of natural scenery in its primitive state, that any style which forms a contrast to it and displays the operations of an intelligent mind, is pleasing in its effects. It is for this reason that people prefer to adorn their grounds with exotic trees and shrubs, in preference to native species, although the latter may be as beautiful as the former are. It indicates creative power, which always presupposes intelligence, hence it has been well said that "Art is but nature, for nature is but the art of God." Sir Joseph Paxton says in one of his essays that "the geometrical flower garden is, above all others, the most to be recommended, because of its readily admitting the greatest variety of flowers throughout the season." Sir Walter Scott has said: "Nothing is so completely the child of art as a garden. It is, indeed, in our modern sense one of the last refinements of civilized life. To attempt, therefore, to disguise wholly its artificial character, is as great folly as if men were to make their houses resemble as much as possible the rudeness of a natural cavern."

The gardenesque style and the picturesque style are both well adapted to places of large extent; they are, indeed, the only styles in which these can be laid out; for it would not be desirable, as a matter of taste, to lay out 10 or 20 acres as a geometrical flower garden, but the latter is a very desirable feature to introduce into the other two.

I give some plans of gardens laid out in this style, most of which have been carried out in practice; they will give my readers some idea of the way in which such gardens are to be laid out, and will enable them to exercise their ingenuity in devising plans for their own gardens. Such plans should always be mapped out on paper and drawn to a regular scale, with the distances from the various points marked on the map, so as to facilitate the plan being transferred to, or laid out on, the ground.

Care should always be taken when designs of this character are laid out in close proximity to the house, or are looked upon from the principal windows, to have them parallel to, or at right angles with, the house. If they are at all askew, they will be a continual source of annoyance to every person possessed of a mathematical eye, who sees them. In laying down the design on the ground, the first step is to lay down a center line or a base line, with a perpendicular line or one at right angles to it; sometimes three or four such lines may be required. How to lay down or to obtain such lines correctly on the ground is to be found in the few mathematical problems of which I give the solutions. These base and cross lines should remain in permanence until the work is finished, as, if removed from time to time, they can seldom be replaced correctly. Two or three balls of good stout twine and some good strong stakes, to be driven two feet into the ground, will answer for this purpose.

Where there are many intersecting points or subsidiary centers to be made, strike a circle of the diameter of these points or centers from the principal or central point; then, on the circle so obtained, measure the distance of the points, or centers, from the central base line and the vertical line intersecting it; this will test the work for errors in measurement and detect them, as it gives four fixed points to do it by.

Some of the best suggestions for figures to

be laid out on lawns without gravel walks, are to be found in the leaves of many plants, such as Caladinms, Callas, Maples and other trees and shrubs. By pressing some of their leaves and then arranging them on stiff paper, some very useful hints can be had.

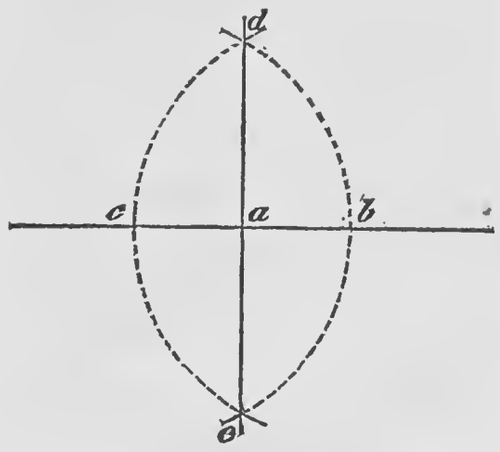

FIG. 152.

From any given point in a right line to erect a perpendicular or a line at right angles:—

On each side of the point *a*, take equal distances, as *a b*, *a c*; from *b* and *c*, as centers, with any radius greater than *a b* or *a c*, describe arcs cutting each other in *d* or *e*; then a line drawn from the point *a* through *d* or *e*, will be the perpendicular, or right-angled line required.

This is a ready way of getting the transverse diameter of a circle, laying out parallel lines, etc.

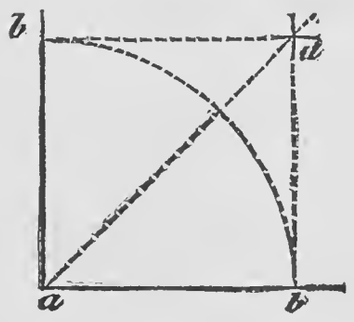

FIG. 153.

To divide a given angle into two equal parts:—

From the point *a* as a center, with any convenient distance, describe the arc *b b*; and from *b b*, as centers, with the same or any other convenient distance, describe ares cutting each other in *d*; then a line drawn from the point *a*, through *d*, will divide the angle into equal parts.

This problem is useful in laying out walks running at angles of 45 degrees to any straight line, and to determine the proper position for arbors, vases or statues when placed in angles of gardens.

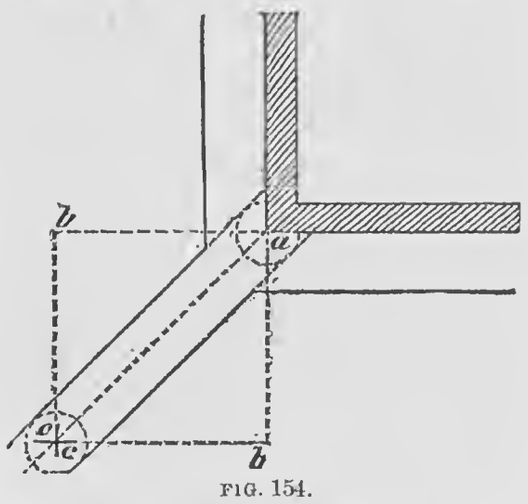

FIG. 154.

To set off a walk perpendicular to the corner of a wall:

Carry out the lines of the wall straight, each way, equal distances from *a* to any convenient points, as *b b*; from the two ends of these lines, with equal radii, describe two arcs; from where they bisect each other, as at *c c*, draw a line to the corner of the wall, *a*, which line will be the center of the walk. At *c c* and *a* draw two circles the width of the proposed walk; lines drawn from both sides of these circles will give the edge lines of the walk.

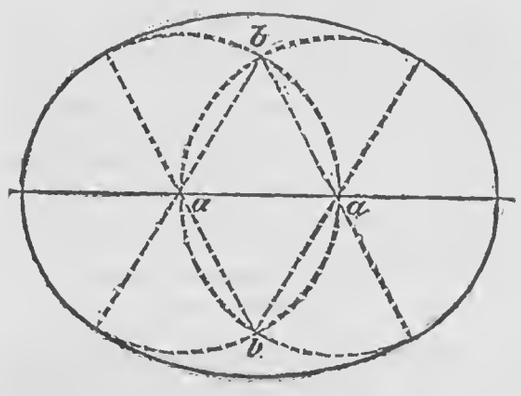

FIG. 155.

To describe an oval whose length is given:—

Divide the length into three equal parts, let the two inner points so found, *a a*, be the centers of two circles, which shall form the ends of the oval; the intersecting points, *b b*, of these two circles, will be centers to the two segments required to complete the figure. This makes an obtuse oval and is not geometrically correct, but is the one generally used in laying out gardens.

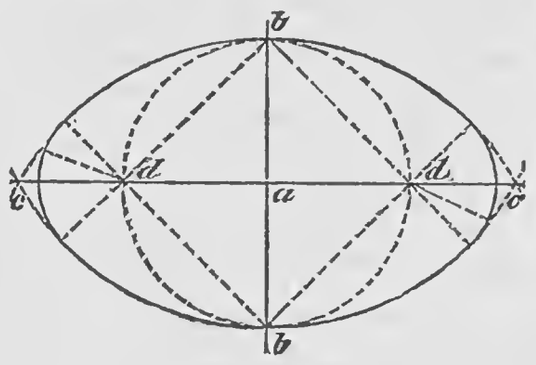

FIG. 156.

To describe an oval whose width is given:—

From the point *a*, where the conjugate and transverse diameters intersect each other, describe a circle whose diameter shall equal the given width. From the points *b b*, where the diameter intersects the circle, describe two segments which will intersect each other on the conjugate diameter, as at *c c*. Then, from the points *d d*, where the circle intersects the conjugate diameter, describe the quadrant of a circle which will connect the ends of the segments.

This gives a more acute oval or ellipse than Fig. 155, and one nearly geometrically correct. When laid down on a lawn or in a design for a garden, it looks much better than Fig. 155 which should only be used when the adjoining figures are circles or segments of circles.

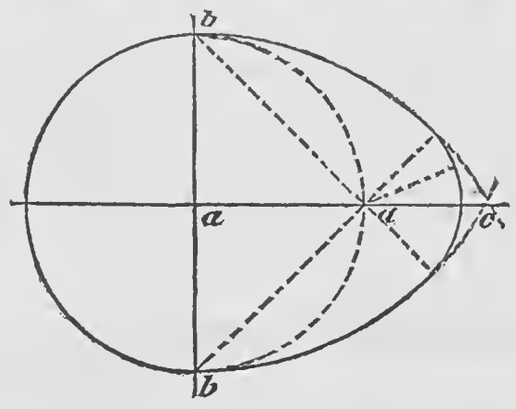

FIG. 157.

To form an egg-shaped figure:—

This is formed in the same way for one-half of the figure as in Fig. 156, with the addition of the semi-circle for the other half.

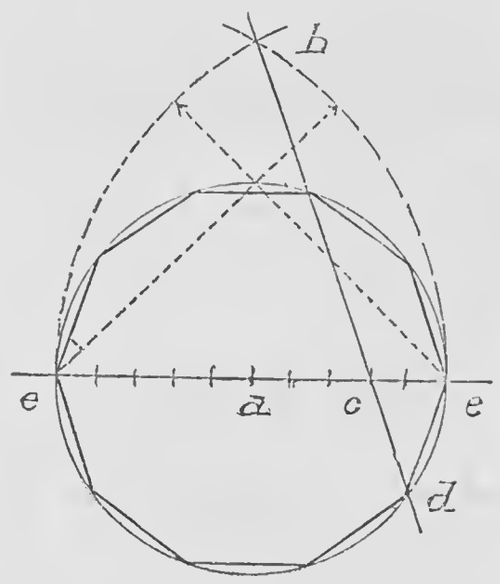

FIG. 158.

In a given circle to inscribe any regular polygon:—

Divide the diameter, *e e*, into as many equal parts as the polygon is to have sides; from *e e* as centers, taking the diameter of the circle as a radius, describe ares cutting each other in *b*; draw a line from *b* through the *second* division, *c*, until it intersects the circumference of the circle, as at *d*; the distance from *d* to *e* will be the length of one side of the polygon required; divide this distance off on the circumference and connect the points, and the polygon will be described.

I have given as an example a decagon, but any odd or even-numbered sided polygon can be laid out in the same way, always remembering that the line *b d* must pass through the second of the divisions into which the diameter is divided. In laying out a hexagon it is not necessary to lay it out in this way, as the side of a hexagon is equal to the radius, or half the diameter, of the circle, so that in it we have always a constant measure given.

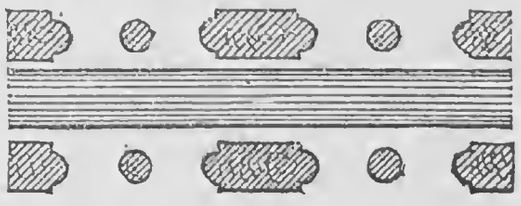

FIG. 159.

Figs. 159 and 160 are examples of flower beds to be laid out on the grass borders on each side of a straight walk leading up to the house, as, for instance, from the street or road—only every alternate circular bed should be planted with a shrub, and then not with any species that will exceed four feet high when fully grown, or that cannot be kept within that hight by pruning. Rhododendrons, Azalea amœna, Tree-Pæonias, the dwarf-growing Japanese Maples and the curious dwarf varieties of Retinosporas, Thujas, Abies and other coniferous evergreens are admirably suited for this purpose.

FIG. 160.

Fig. 160 would harmonize very well with houses in the Gothic or English cottage style. Fig. 159 is adapted to the Italian style. The semi-circular lobes at the ends of the square figures should be planted with low-growing, brilliant-colored flowers, or with plants of striking-colored foliage, but of dwarf habit.

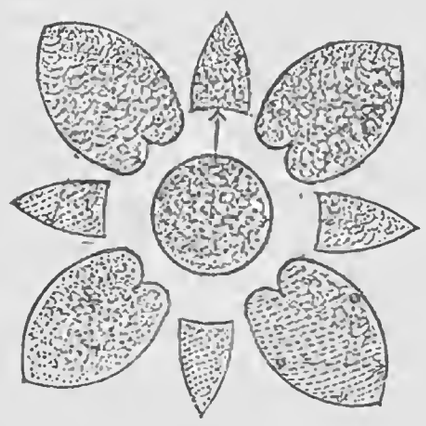

FIG. 161.

Fig. 161 is an example of flower-beds laid out on a lawn without and gravel walks surrounding the beds. The smaller beds should be planted with dwarf-growing, continuously-blooming, bright-colored flowers, such as Zonale Geraniums, Verbenas, etc. The larger beds may be mixed-planted, that is, with perennial herbaceous plants, scarlet Geraniums, plants with colored foliage, Gladiolus and similar plants. To display such figures, it is absolutely necessary to keep the lawn closely mown. The effect will be wholly destroyed, if the lawn is allowed to become a field of grass whose only value is the hay crop.

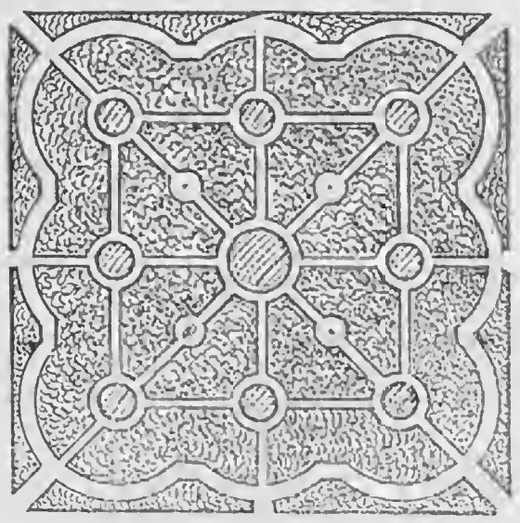

FIG. 162.

Fig. 162 is an example of a tetragon in which the narrow walks are to be graveled and the wide walk to be of grass, if it is so desired. If not, it may be reduced in width by adding to the width of the outer beds.

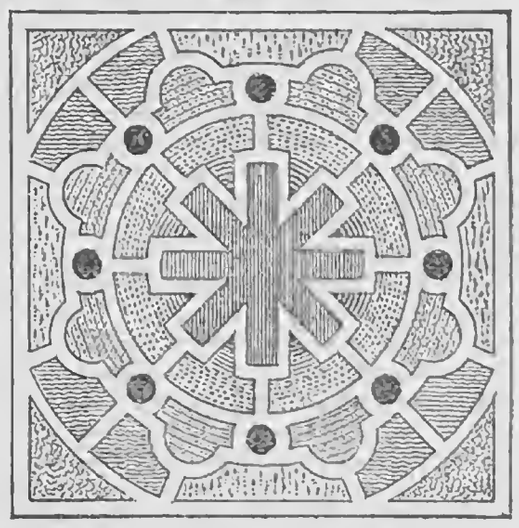

FIG. 163.

Fig. 163 is a combination of an octangular figure with a combination of circular and angular figures. The walks are of gravel. The beds in this figure are numerous and afford a good opportunity for planting largely in color.

Fig. 164 is a circular figure divided decagonally. The walks are of gravel and the larger

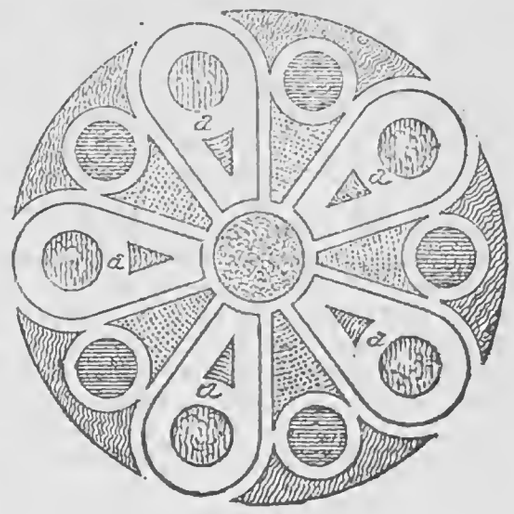

FIG. 164.

beds, *a*, are laid down in grass in which a circular and a trigonal figure are cut out.

Entomological.

RASPBERRY SLUGS.

I HAVE recently been asked what will destroy the worms that are making so many little holes in the raspberry leaves, and, thinking there may be others who would like to know, I will give here a brief *resumé* of what I have given verbally to others.

The raspberry slug that eats the holes above referred to, is, when full-grown, a little more than half an inch long, of about the same green color as the leaf upon which it feeds, with the exception that there is a line of darker green along the back. This is the larva of what is known as the raspberry saw-fly (Selandria rubi); not a fly in the sense of a two-winged insect; for it is a black insect with four transparent wings, and is related to the bees and wasps. The worm, or larva, has 22 legs), a pair to each segment of the body except the fourth; it is nearly cylindrical, thickly set with green tubercles, from which arise fleshy-looking, forked, pale-green, hair-like branches, the two forks bending, in most cases, towards the extremities of the body.

These worms are produced from eggs deposited in the leaves soon after they are expanded. For this purpose the female saw-fly has an ovipositor beneath the posterior part of the body, by means of which the eggs are inserted beneath the skin alongside of the veins. The young worm soon emerges from the egg, escaping through an irregular hole made in the side of the swelling caused by the presence of the egg in the leaf, and at first feeds upon the more tender parts of the tissue. As it increases in size, it gnaws irregular holes in the leaf, or notches in its edges, often leaving only the coarser framework. The worms come to maturity from the middle of May to the middle or last of June, according to the latitude. At this time they leave the bushes, descend to the ground which they enter, and change to chrysalids, from which the flies come in due time, to deposit their eggs for another brood of the worms.

The latter feed mostly at night on the upper side of the leaf, where they may be found in the morning or during cloudy weather. For this reason it is easy to reach them with substances that are used for their destruction. Several remedies have been recommended, but a little air-slaked lime dusted over the leaves in the morning while the dew is on, seems preferable to any of the others, for the reason that it destroys most of the worms and is harmless to the fruit. There are a few of the worms every season, often so few that no remedy seems necessary; but when they become very numerous so that the leaves are liable to be so eaten as to interfere with the growth of the fruit, the above remedy generally proves sufficient. G. H. FRENCH.

Carbondale, Ill.

The Herdsman.

SOME NEW INSTANCES OF BONE-CHEWING BY CATTLE.

PROFESSOR F. H. STORER.

ATTENTION has often been called, in the agricultural papers, to the fact that cows will sometimes munch bones very persistently in the pasture, and explanations have been offered both to the effect that the appetite of the animals is depraved and that they need some alterative medicine, or that they need phosphates to supply those carried away in their milk. Indeed, so firmly is the idea established that phosphates should be given in such cases, that some of the agricultural dealers in our American cities habitually keep and sell a coarse bone-meal, under the trade name "crushed-bone," which is prepared on purpose for feeding milch cows.

Some rather emphatic instances of this habit of cattle have recently been put on record, in the London journal "Nature." Mr. H. C. Donovan, writing from South Africa, says, "In the colony of Natal the cattle have an extraordinary liking for bones. They will stand for hours with a bone in the mouth quietly munching, sucking, or, perhaps more correctly speaking, levigating the bone with the tongue. I have not heard that cattle have the same habit in the other colonies of South Africa, but I have been told that cattle exhibit the same taste in some parts of South Australia. In Natal there is, I believe, a scarcity of chalk and limestone in the geological formation. Will this fact account for the habit? Do the cattle lick the bones in search of lime? I may mention that horses and other herbivorous animals in Natal do not exhibit the same taste."

In corroboration of the above letter, Mr. W. M. Williams remarks that in some parts of Norway the cattle have a similar habit of munching bones, "especially at the upper pastnrages around the 'sæters,' or mountain chalets, where they are commonly supplied with a daily modicum of fish bones and salt, which they eat with great avidity." He adds, "there is but little lime on the Norwegian "fjelds" the prevailing rock is mica schist."

In connection with these accounts, Prof. John Le Conte, of the University of California, recalls the fact that many years ago (in 1845), he published in one of our medical journals, an account of the same habit in cows in one of the Southern States. He says:—"The cows which live on the extensive savannas and pine-barrens lying on the north side of the Altamaha River, in McIntosh Co., Georgia, subsist upon very coarse species of grasses, which are probably deficient in some of the phosphatic or calcareous ingredients essential to healthy nutrition, for these animals are constantly observed to chew bones. They frequently remain stationary for hours, with the head elevated to prevent the saliva from escaping from the mouth; they will, by constant trituration, gradually reduce the bony mass to a very small size, when it is rejected as an unmanageable morsel. The cattle in this section of the State are usually rather lean, and cows brought from the fertile plantations in the neighborhood, if allowed to subsist on what they can procure in the savannas and pine-barrens, in the course of a year or two become equally thin; and ultimately fall into the habit of eating bones."

The Norwegian use of fish bones is plainly commendable, and it could readily be imitated in this country by feeding out the better sort of fish-scrap, such as is prepared in Maine expressly for foddering purposes. It is to be remarked, however, that in most cases such as were just now supposed, of an insufficient supply of the inorganic constituents of food; it is a lime-compound rather than a phosphate that needs to be given to the animals, as such. Phosphates had better be supplied to the animals in the form of grain or oil-cake or shorts, which contain much phosphate of potash, while the lime may be administered either in the form of whiting scattered upon the moistened food, or by placing a lump of chalk or other soft limestone where the animals can lick it when they please.

STOCK NOTES.

PLEURO-PNEUMONIA.—Com. Le Duc has sent to the Hon James W. Covert, Chairman of the House Committee on Agriculture, the report of Dr. C. P. Lyman on the subject of "pleuro-pneumonia, or lung plague of cattle, telling where and to what extent the disease exists in this country. It is merely a diary of his travels in the infected districts in Febuary and March, together with the results of his inquiries and personal examination of the circumstances attending the outbreak of the disease in the localities he visited. He sums up the outcome of his investigation as follows:—

"As a result of my investigation thus far, I find this ruinous foreign plague actually existing among the cattle in the following States: Connecticut, in Fairfield county; New York, in New York; Westchester, Putnam, King and Queen's counties; New Jersey, in Atlantic, Gloucester, Camden, Burlington, Ocean, Mercer, Monmouth, Middlesex, Hunterdon, Morris, Essex, Union, Bergen, and Hudson counties; Pennsylvania, in Philadelphia, Chester, Montgomery, Bucks, Lehigh, Cumberland, York, Delaware, Lancaster, and Adams counties; Maryland, in Carroll, Baltimore, Harford, and Cecil counties.

"The middle and southern portions of these States have not yet been visited. No examination has as yet been made in the District of Columbia, or of the infected territory of Virginia; but, as the plague prevailed quite extensively in both of these localities last season, it will no doubt be found still in existence when the investigation takes place." Now, prompt upon this trustworthy report, let us have legislation for the speedy suppression of the plague—a perilous manace to the West.

THE SHIRE OR MIDLAND COUNTIES HORSE.—This is one of the largest and most powerful horses bred in England for heavy farm, road and city truck work, Their weight is usually from 1,700 to 2,100 pounds. In breeding, special attention is paid to obtain extra-wide (not round), flat legs, to support such a weight of body and be capable, without injury, of drawing the heavily-loaded vehicles to which they are attached. The fetlock joint, or pastern, must be at the proper angle, neither too oblique nor too upright; the hoof clear and open; the sole so thick as not to wear down to the pavements, and so strong that the shoe-nails will hold well in it. The value of these horses in England alone, is estimated at sixty to sixty-five million dollars, while their annual cost of keep, harness and shoeing, is as much more.

The Swine-Herd.

SUFFOLKS.

The Different Families or Tribes; Breeding, Origin and Points.

COL. F. D. CURTIS.

THE white hogs of England have been so mixed and interbred that it is very difficult to determine where one breed begins and another ends. Most of the importations of white hogs of any name brought into this country cannot trace back, for purity of blood, beyond the breeder from whom they were purchased. They may be called by the general name of Yorkshire or Suffolk, but it will be found that the two breeds differ but slightly in some cases, and then again it will be found that the different importations of the same named breed will also differ.

These similarities and differences go to show that the white pigs of England have been mixed and cross-bred according to the fancies of breeders, or the notions of localities. While some breeders in England have adhered to the more common names of Yorkshire and Suffolk, others have given their pigs which were families of Yorkshires, fancy names, either after the county in which they resided or the town, or in some cases the pigs were called after the manor name. Thus there were Lancashire, large, small and medium: Leicester, Bedfordshire, Buckinghamshire, Middlesex, Manchester, Coleshill, Bushey Breed—probably the same as the Bush Abbey, and the Windsors. The latter were bred by the late Prince Albert and named by him after the castle of that name, which is one of the residences of the royal family. These pigs were afterwards called by others, Prince Albert Suffolks. Prince Albert when living, was a regular exhibitor at the fairs, and as emulous of prizes as other breeders. In 1846 he showed Bedfordshire pigs, and won a prize. The next year he exhibited Bedfordshire and Yorks, then Yorkshires, alternating with Bedfordshires and Suffolks; then Suffolks, and in 1854 he exhibited for the first time his pigs under the name of Windsors. The above list tells the story of English breeding, and explains the multiplicity of names given to pigs of the same blood. In many cases these same families of pigs we have enumerated, were called by different persons either Yorkshire or Suffolk, and, no doubt, pigs of the same family have been imported into America and have been designated by different names, when in reality they were of the same blood. It would puzzle a good judge to tell the difference between a well-bred Yorkshire or Suffolk, and the Lancashires which have been introduced into Ohio and some other States. All of these pigs are white and have essentially the same characteristics and good qualities.

Latterly the English breeders have begun, very properly, to designate these different families which they used to denominate "breeds," as the "small white breed," and the "large white breed." The term breed has been misapplied very often by English breeders. It takes years of careful breeding in a direct line to establish a breed; but a family may be started by cross-breeding, which was frequently done by English farmers who had an ambition to emulate other counties or other farmers, in originating pigs with a new name although the blood might be the same. Such families, by long breeding in a direct line, if they did not run out—which is usually the case—would become thoroughbred. Cross-bred pigs always show to better advantage than these thoroughbreds, because they will bear heavier feeding, and have stronger appetites and inclination to grow; that is to say, they possess the fine and delicate qualities of the thoroughbred, united with the strength of constitution and ability to consume and assimilate food, natural to grades. This gives them rapid growth and a precocious development, with the native roughness and coarseness so toned down that they often out-match the pure-bred progenitors to whom they owe their excellence. There are families among thoroughbreds, as certain sires and dams often possess special peculiarities, which are indicated in their offsprings.

American importers have been disposed to accept these different families as established breeds without question; hence, we have in this country a variety of Suffolks, which it would require considerable variation in a scale of points and description to fit exactly to the different tribes. This last term may be used as a synonym for family, and would be a better title for the branches of a breed rather than to call them each a breed with a different name. These tribes of Suffolks vary most in size and coating. Some of them are nearly naked, their coats being so thin; while others have a thick coat of hair. One tribe, often exhibited at the fairs of the N. Y. State Agricultural Society, may very properly be called the doll pigs, they are so small and fine. Suffolks are very handsome and the easiest to keep of any white pigs.

The young Suffolks are small and it takes them some time to make a start in growth. The mothers are prolific, kind and exceedingly docile. The maximum weight of full-grown Suffolks may be put down at 400 pounds, although 350 pounds would be nearer the average; while the minimum weight is about 250 pounds for grown hogs, and 150 pounds for pigs under a year old. The greatest objection to the Suffolks is the exceedingly fat character of the flesh, which unfits them for bacon, and makes the hams not so desirable as those of other breeds in which the lean meat is more largely mingled with the fat.

Stickney Brothers, of Mass., a number of years ago, were large importers of Suffolks. They have been extensively imported and bred by Hon. John Wentworth, Ill., and by Mr. Dinsmore, N. Y. These and other importers have selected strains or styles of the breed which suited their fancies, with thin or thick coats; or large or small in size as the case might be. A true type of Suffolk should correspond to the following standard:—Head small, very short; cheeks prominent and full; face dished; snout small and very short; jowl fine; ears small, thin, upright, soft and silky; neck very short and thick, the head appearing almost as if set on front of shoulders, no arching of crest; chest wide and deep, elbows standing out; brisket wide but not deep; shoulders and crop—shoulders thick, rather upright, winding outward from top to elbows; crops wide and full; sides and flank—ribs well arched out from back; good length between shoulder and ham; flank well filled out and coming well down at ham; back broad, level and straight from crest to tail, not falling off or down at tail; hams wide and full, well rounded; twist very wide and full all of the way down; legs and feet—legs small and very short, standing wide apart, in sows just keeping belly from the ground, bone fine; feet small; hoofs rather spreading; tail small, long and tapering; skin, hair and color—skin thin, of a pinkish shade, free from color; hair fine and silky, not too thick; color of hair pale yellowish-white, perfectly free from spots or other color; size small to medium.

Certainly this is a formidable scale of points for so small a pig.

Sheep Husbandry.

THE BEST BREED OF SHEEP FOR THE WEST?

IN the RURAL of Feb. 14, Mr. A. B. Allen lauds highly the English middle-wooled sheep, giving weights of choice specimens at various ages, and consequently the gain they made in given intervals. Now I think that such statements are apt to mislead the average farmer, at least here in the West, with regard to the most profitable sheep to keep. Is it possible for any considerable flock of his favorite Oxford Downs to attain such weights on what is ordinarily considered good feed. In the above article not a word is said as to the care, feed or numbers in the flock of the specimens extolled, and I will venture to maintain that the owner cannot obtain anything near such weights as those given with even a hundred kept together. I doubt not but the Oxford Downs are profitable sheep in some localities in the Eastern States, where land is poor, herbage scant and grain high-priced; but from my own observation I have come to the conclusion that the various sorts of Down sheep are vastly inferior as wool producers to the Leicester or Cotswold, to say nothing of the American Merino. Then again, while we of the West have to transport our stock such long distances to the seaboard, it would not be profitable to raise lambs either for the Eastern or European markets, for they shrink so rapidly when deprived of suitable food and care, that the starvation and rough usage incident to shipping would reduce them to a miserable condition by the time they arrived at their destination. It is partly due to the great shrinkage in transportation, most likely, that shippers here will pay the highest price per pound for animals of the greatest weight, provided they are well fatted, regardless of quality.

Hence the sheep raisers of the Western States must look to the production, not of market lambs, but of wool and mutton sheep, for a profit, and hence the question arises, what kind of sheep are best for these purposes. The Cotswolds, while great favorites with many on account of their large size, aptitude to fatten and great prolificacy, yet, although they grow a long, lustrous wool that sells well at the factories, they have the drawback that owing to the openness of their fleeces, they yield a light clip in proportion to their weight. The Leicesters are open to the same objection, besides being not quite hardy and far less prolific. A sheep, to be well adapted to the needs of Western sheep raisers, should be of large size, produce a very heavy fleece of valuable wool, and thrive well in flocks of several hundreds; for the sheep raiser here must have but few flocks, as the cost of fencing is very great—in many instances exceeding that of the land—which would preclude many divisions in their pastures.

I have read of a breed of sheep called the Improved Kentucky, originated by Robert Scott, of Frankfort, Ky., and described as having wool from ten to twelve inches long, surpassing the Cotswold's in fineness, softness and the number of fibers to the square inch, the fleece being so close as to scarcely allow of any parting; sheep extremely hardy, healthy, fattening on common pastures in the shortest time, and very prolific. Mr. Scott's flock often producing a third more lambs than the number of his breeding ewes; while another authority describes them as heavy-bodied, long-wooled, and producing a weighty fleece, good mutton and a heavy market lamb.

Now, if this description approximates anywhere near the truth, are not these the sheep that supply a long-felt want? for as they have a dash of Merino blood in their make-up, they would probably do to mass in large flocks, while from the length of staple and density of fleece, they would yield an unsurpassed clip of wool. Will not some one who knows all about them tell RURAL readers the "truth about it."

Gallatin, Mo. J. W. S.

Dairy Husbandry.

GREAT YIELDS OF MILK AND BUTTER.

WHEN reports of these are made, it seems proper that the owners of the animals ought to state whether they *themselves* have kept the daily record, or trusted this to hired help who might be liable to make mistakes.

A Holstein cow is said to have given 12 335 pounds of milk in ten consecutive months. If she kept on at this rate for 12 months the yield would amount to the extraordinary weight of 14,802 pounds. I would like to ask what feed was given to this cow to produce so much milk, and its cost? It would, doubtless, fetch a fair price in a *city* market, where people are fortunate who obtain such as is not more than half water; but what weight of cheese would this milk make, and what would be the value per pound of such cheese? Again, how much butter would it make and its value per pound? I have been told that it takes 20 to 25 quarts of Holstein milk to make a pound of butter; but with a Guernsey or Jersey cow, five to six quarts often make a pound. Now, if we add four times the quantity of water to the latter's milk, we have it just as rich as the former. Would this not be an easier process than to be obliged to draw from the udder of a cow such an excess of water contained in her milk, if quantity, irrespective of quality, is alone to be the boast.

As to the beef of Holsteins, I see it asserted by some of their breeders that it equals that of the Short-horn and Hereford in the London market. I have seen hundreds of fat cattle there from Holland, but the butchers informed me that it was not generally worth so much as the Short-horn and Hereford by a half-penny to a penny per pound—one to two cents of our money.

Jersey cows are represented as giving from 500 to 705 pounds of butter per annum. I do not wish to be understood as disputing the truth of these reports; but I assert that it is quite extraordinary for any cow to average over one pound of butter per day throughout the year—365 pounds in all; and when anything above this is reported, the evidence of it should be fully stated and indisputable, otherwise the great majority of dairymen will come to the conclusion that there is some mistake in making up the record. A. B. A.

A New Premium.

THE corresponding Secretary, Mr. Ingalshe, of the Washington County Agricultural Society, has suggested to me the excellent idea that agricultural Societies should offer premiums for the best records of dairy cows in connection with the National Dairy Cattle Club. Such premiums could be awarded upon the

certificate given by the Dairy Club, and might cover both the yearly and the periodic product of milk, or butter, or both. We doubt not but that the Dairy Cattle Club, through Secretary L. S. Hardin, 309 Greenwich St., New York City, would be glad to co-operate with both individuals and Societies in furthering this object. It would certainly be a new phase in cattle shows, and one of decided interest to dairymen. We hope to see the suggestion carried out generally. We shall certainly do it in Saratoga County. F. D. C.

CLEANLINESS IN MILKING.—To keep milk clean while in the act of drawing it, the cow must be clean, her bag and teats washed and wiped before commencing to milk her, and the milkman's hands be then washed. After straining and setting, see that no foul air can come from any quarter to taint the milk; and for this we must be particularly careful, for such is often borne on a strong breeze fully a mile off or more from the place where it originated. It is, of course, presupposed that all vessels used for holding the milk, are kept clean and entirely clear of every sort of odors. We have often seen the dairy house placed close to the cattle yard, poultry house, and, what is foulest of all, a dirty pig-pen. No wonder where this is the case so much butter and cheese are sent to market not fit to be eaten.

Miscellaneous.

THE TRUTH ABOUT IT.

[THE object of articles under this heading is not so much to deal with "humbugs" as with the many unconscious errors that creep into the methods of daily country routine life.—EDS.]

ARE SUBSTITUTES FRAUDS?

THE popular mind is just now agitated in regard to some substitutions for staple products, among which glucose, made from starch, and oleomargarine, made from tallow, engage the attention of those interested in the manufacture and consumption of sugar and butter. Very naturally consumers suspect the virtue of these articles of food, made by chemical processes instead of by natural methods; and producers are jealous of them, because through them their craft is in danger. The first question which arises in the mind of a disinterested person is this:—"Are these substitutions frauds; or are they to be considered in the light of modern improvements upon old methods, by which the public is provided with cheaper articles of consumption, which may legitimately take the place of those which they are intended to displace?" A rational reply to such a query cannot be given by an advocate for either of the parties immediately interested. Some one only whose interests are not involved, and who understands well the character of the substitutions and the general history of such matters, can arrive at an impartial judgment in regard to them.

It should be considered that this is no new thing, that the very same sort of processes have been in existence with other substances for many years, and that industries which were once staple of their kind, have been entirely ruined and displaced by new discoveries. Formerly the production of indigo and madder occupied thousands of cultivators of the soil; but chemists found methods of producing artificial blues and reds so cheaply, that these dye stuffs could no longer be produced profitably, and the growth of them ceased. So, just at the present time, the owners of enormous capital interested in coal-gas manufactories and the lighting of cities, find their interests threatened with destruction by new and cheaper methods of making gas from water, and more certainly by the use of electricity in producing light. The aniline colors, produced from waste petroleum products and gas tar, and that are of such exquisite shades and of such remarkable cheapness, have worked wonderful changes in the business of making dye stuffs and colors. The discovery of Bessemer's process of making steel almost as cheaply as iron, ruined thousands of steel manufacturers, or forced them to remodel their works at great expense. Railroads destroyed canals, and steamships wrought ruin to the sailing ship builders; the introduction of cotton as a textile fiber, destroyed thousands of linen factories; and "shoddy" and "mungo," bear hard upon the patient and uncomplaining sheep and its owner, as well as torment and fret the unfortunate wearer of the half-rotten and miserable clothing that is made from them. On every hand, wherever we look we find this principle at work.

Tireless energy, skillful analytical and synthetical processes are busy every day in cheapening the cost of manufactured products, and so long as the restless activity of the human mind is in operation, so long may established interests fear danger from the inevitable substitution of new and cheaper articles of consumption. It does seem as though the common idea of the optimist, whether he be Mussulman heathen or Christian, that, "what is, must be;" and "it is useless to strive against the inevitable," must be accepted as an article of our modern creed, and no one must be surprised or discomfited to awake any morning to find his occupation gone and the products of his industry supplanted by some new invention.

So the bee-keeper must learn to view the attractive jars of glucose, containing a fragment of comb made of celluloid, by machinery, and flavored by chemical products to imitate his pure honey, with at least stolidity, if not without disgust; and the dairyman may as well make up his mind that his choice goods will have to compete with the product of the tallow refinery, and the cow must submit to the indignity and find a recompense in the thought that the interloping ox pays the penalty of its competition with her butter, in his death at the shambles. But the poor, deluded public! Nothing remains for them but to take what is offered them, "asking no questions for conscience sake," and quietly awaiting the time when the chemist shall cater for all their wants, and his laboratory assume the places of field, garden and dairy, and the science of living be represented by a cabalistic formula, something like C-O-H-N, with some complicated additions of a few other letters and some small figures.

In view of all these considerations, then, are we to look upon every substitute for an existing thing, as a fraud? Certainly not, so long as it comes to us for what it is, and not as something which it is not; and if it endeavors to live upon its own merits. H. S.

WHAT OTHERS SAY.

WHAT CROPS TO RAISE.—The best way is for a farmer to determine what crops in regular demand are best adapted to his soil and climate, and also to his own abilities; what proportion of each he can grow to best advantage, and then continue, with little variation, to cultivate about the same number of acres of each crop from year to year. The one who pursues such a course for a series of years, will meet with fewer losses and accumulate more than the one who changes from one crop to another according as the prices have ruled the previous year.—Am. Rural Home.

THIN SEEDING.—Mr. W. A. Armstrong says "There can be no doubt that the farmers of this country throw away millions every year in seed that does not grow, and the entire sum is absolute waste. Suppose a bushel of wheat is worth one and a half dollar, and on every acre sowed in the United States that amount is wasted, it would be $30,000,000 annual loss. Now, if that dollar and a half, the value of the wasted seed, were expended on every acre in added labor to secure superior fitting for the seed, there would be increase in the crop, besides the saving of seed; for with land well fitted there would be need of no more than a bushel of seed to the acre."

PEDIGREED SHORT-HORNS AND FANCY PRICES.—From the tables and the Scotch reports, says the Mark Lane Express, "it will be seen that putting 'fashion' aside, and reckoning Scotch and collective sales, the average price of pure-bred Short-horns at the present time is under £30, probably nearer £25 than £30. At this price they will pay to breed, and be readily purchased—if really good animals—by farmers even in a time of unexampled depression like the present. We are by no means singular in regarding the decline of 'fashion' in Short-horn breeding as indicative of the commencement of an era of far greater usefulness for the Short-horn breed of cattle. From various sources we find similar opinions expressed. The Leeds Mercury says:—At Birmingham the healthy reaction against the excesses of fashion in breeding was happily shown in the prices realized, as animals of real merit sold at fair prices, considering the depression of the times, while fashionably-bred failures were neglected. The fictitious values reached by scions of favorite tribes or families, when the 'Short-horn fancy' was at its hight, will probably never be attained again. Well-bred animals will bring their full commercial value, and that will be sufficient encouragement to good breeding.'" And the National Live Stock Journal (Chicago) for March, referring to the late sale of pure-bred Short-horns there, says:—"It is a good omen, and one auguring well for the Short-horn interest, that the senseless *furore* and speculative mania about so-called 'fancy,' or 'gilt-edged' pedigrees have received their quietus. The common sense and good judgment of intelligent men have revolted against the absurdity of a *pedigree* without an *animal*, and the tide in the right direction may be said to have fairly set in."

ACID IN CHEESE-MAKING.—Prof. Sheldon in his Dairy Farming writes as follows:—"Consciously or unconsciously, most cheese-makers employ acid more or less. The Cheddar dairymaid produces it by 'slip-scalding' and the use of sour whey; the Cheshire by allowing the curd to remain unpressed and warm for a day or more; and the Derbyshire by pressing the fresh curd, and later on salting it on the outside. But the great thing in cheese-making, where acid is intentionally employed is, or ought to be, to make the acid subordinate to the rennet, not the rennet to the acid; and as the acid in a high temperature is much more rapid and powerful in its action, it can easily overwhelm the rennet if it is developed too far. Salt checks the action of acid and rennet alike, and acid checks the action of rennet; hence it follows that the rennet should not be subjected to both checks together, except to a moderate extent. While very fine cheese is made by the aid of acidity directly developed, equally fine is made at a rather low temperature throughout, with a liberal use of rennet and a little or no acid; this gives the rennet the advantage it needs over the acid, because it comes into play faster than acid does at a moderate heat; and where the salt is not applied till the following morning, even though the temperature be low, the result is frequently found to be a cheese of a very good quality. Excessive salt and excessive acid each prevent the ripening of cheese; hence it follows that the rennet, which is the ripening agent in the cheese, should have a chance of getting good hold of the curd, and be well forward in it work, before either acid is developed or salt is applied. This it does very successfully in several methods of cheese-making, which are quite distinct from each other. Many cheese-makers, knowing the effect of acid in expelling the whey quickly from the curd, have employed it too freely, with the view of saving trouble to themselves. They have succeeded in this, but they have nearly ruined the cheese. Acid in cheese-making is indeed a good servant, but it is a bad master; it must always be used with the greatest discretion."

CURD, WHEY, AND CHEESE.—Again, Prof. Sheldon remarks:—"In the process of making cheese, the great bulk of the milk-sugar is not retained in the curd, but passes off in the whey; so it follows that if the whey is imperfectly got out, a too large portion of the milk-sugar is also retained in the cheese, and it is this that is the cause of sweet cheese. This sugar, too, or a portion of it, enters into fermentation in the cheese, forming, amongst other products, carbonic acid gas, which, in trying to escape, causes the cheese to heave and become porous. An excess of whey causes annatto, that is used for coloring cheese, to be unequally distributed, so that the cheese is not uniform color; or the lactic acid formed from the milk-sugar has a destructive effect on the coloring matter later on, causing it to fade and the cheese to become of a bad color. The presence of the whey and the fermentation caused by the milk-sugar cause the cheese to decay without ripening, in a manner that makes it a very disagreeable and unhealthful article of food. The necessity of getting out all the moisture, over and above the quantity which the cheese may safely be allowed to retain, will now be apparent. This is effected, first, by the cutting of the curd; second, by pressure; and third, by a moderate amount of acidity, where such is employed. Acidity in cheese-making is the most effectual means of expelling the whey, but it must be employed with great caution, for, though it is a capital servant, it is a bad master."

WORTH REPEATING.—Some of the Eastern farmers talk of killing the gosling ere the prospective golden egg is developed. They discourage sugar-beet growing before they have learned how to grow sugar beets. But of this faithless class is not Mr. W. A. Pearson, of Vassalboro, Maine. He planted five-eights of an acre last year, dressed with barnyard manure, sprinkled a mixture of superphosphate and plaster in the drill, thinned the plants to 12 inches in rows 30 inches apart, and got as much for his beets as would buy 75 bushels of corn, and was well satisfied with the success. He would have considered 120 bushels of corn per acre a good crop for Maine. Colonel Parker acknowledges the receipt of $447 for 166,915 pounds from 3¼ acres.—N. Y. Tribune and Millers' Weekly.

DAIRYMAIDS.—We take the following from the Dublin Farmers' Gazette: It ought not to be difficult, one would think, to induce respectable girls to turn their attention to dairy work; but, nevertheless, it is not easy to do so. Girls are eager to go into shops or become apprentices to millinery and dressmaking, although in either case they will not earn more than six or seven shillings a week, out of which pittance they must clothe, lodge and board themselves; whereas, a first-class dairymaid will earn £20 a year and often more, with comfortable board and lodging. There are many governesses who do not earn as much; but, then, girls who stand behind a counter for ten or twelve hours daily, or work like white slaves in the ill-ventilated work-room of a milliner or dressmaker, or have to bear with the tempers and try to hammer in some of the elements of education into the dull heads of a set of fractious children, are all "young ladies;" whereas, a dairymaid is "only a servant." It is low, ignorant pride that is at the bottom of the matter, and it is that which drives so many shop girls in large cities into evil courses.

PRESERVING GREEN CORN AND PEAS.—Green corn and peas contain a large quantity of sugar and albumen, and these substances ferment very readily if exposed to the air. In canning these vegetables, they should be packed when thoroughly well cooked and boiling hot, and should be inclosed air-tight immediately. They may be packed in glass cans, quite full, and occasionally the cans may be placed in a boiler with cold water gradually heated and boiled for 15 minutes. This acts as a preservative.—N. Y. Times.

ORIGIN OF EARLY AMBER CANE.—Mr. E. Y. Teas, a well-known horticulturist of Indiana, on his visit to Europe in 1860, purchased in Paris a few pounds of Chinese sugar-cane seed, which he planted. In the product of this lot of seed, one stalk appeared of different habit from the rest, and that ripened its seed before the rest of the plot was fairly in bloom. The seed from this stalk was carefully saved and planted separately, to prevent mixture. This cane ripened much earlier than any other had been known to, and the sirup from it was superior in taste and color to any previously produced. From its earliness and the beautiful amber color of the sirup, Mr. Teas named it Early Amber, and under that name distributed it far and wide. That it was a sport, different from anything that had ever been known, there is no doubt.—Colman's Rural World.

PLUMS.—Mr. J. J. Thomas, of the Country Gentleman names, the following 13 sorts, ripening at different times, as generally popular: Rivers's Early Favorite, Imperial Ottoman, Lawrence's Favorite, Prince's Yellow Gage, Green Gage, Lombard, McLaughlin, Washington, Smith's Orleans, Jefferson, Bradshaw, Reine Claude de Bavay, Coe's Golden Drop. Where the seasons are long, Roe's Autumn Gage is valuable in October. For market, take Lombard, Smith's Orleans, Pond's Seedling, Damson, Reine Claude de Bavay, Yellow Egg. Where it succeeds well, Wild Goose is a good market sort. For prunes, Italian and German prunes are valuable.

ARE WIND-BREAKS BENEFICIAL?—Mr. Batcham, in the Ohio Farmer, thinks not. He concludes an article thus: There is more of health and nutrition for growing trees or plants in the breezes of summer than most people imagine. The same is also true in reference to the inmates of our dwellings; and people make a great mistake who plant evergreens or other trees so thickly as to shut out, to any considerable degree, the sunshine and the winds from their home grounds. Every housewife knows how rapidly mildew is developed in cellars and closets during damp, sultry weather, and what a sure preventive of all fungus action is found in sunshine. Fungus spores of many kinds are floating everwhere in the atmosphere during summer, only seeking the right place of lodgment and sufficient heat and moisture to start them into growth. Some of these are known to be injurious to personal health; and the best means we have of guarding against their poisonous influences is the blessed sunshine—the greatest anti-fungoid known.

A HORSE BISCUIT is being manufactured in Russia to take the place of oats. It is made of crushed oats and the flour of gray peas, mixed with hempseed oil and salt, and is four inches in diameter. A day's rations weighs about four pounds, and is equal to ten pounds of oats. The horses like the biscuits when soaked in water, and if fed exclusively on them, though they lose in flesh, are still fit for fatiguing work.

Industrial Implements.

IMPLEMENT NOTES.

AS AN EXAMPLE OF STEADY progress in manufacture, may be mentioned the fact that six years ago Mr. W. W. Grier, Sec'y of the Dexter Spring Co., of Hulton, Pa., began making the above favorably known springs in the basement of his barn; whereas now, the business has become so enlarged that 40 hands are employed, and the monthly sales amount to over $10,000.

AN IMPROVED VIBRATOR THRASHER will soon be brought out by J. I. CASE & Co., of Racine Wis., already widely known for the excellence of their manufacture of all sorts of horse-powers and thrashing machinery. The Improved Vibrator is expected to *Eclipse* everything of the sort yet seen.

Everywhere.

RURAL SPECIAL REPORTS.

ARKANSAS, Beebe, White Co., April 29.—Crops are looking well, except that wheat is inclined to rust. Cotton is almost all planted, and some are plowing corn. Fruits look promising now, and my clover is a sight that draws the neighbors' attention. People aronnd here have been depending almost entirely on corn and cotton and have to buy from the North all the wheaten flour they use—they use a good deal of corn meal, however, for bread. That whirl-wind noticed in the RURAL's News, or an off-shoot of it, visited this section, passing by El Paso, a little town about ten miles away. It moved in the shape of a funnel. It struck the corn-crib of a friend of mine, scattered the corn, crib and fences so that not a trace of them could be found, killed the wheat over which it swept; then rose up from the ground for a bit, but soon descended in a piece of timber and burst its way through, tearing even the stumps out of the ground. It next struck a house of two large rooms and two shed rooms, killed the housewife and three children, one of whom was whirled a mile away where it was found with its brains out. The husband, Mr. Pool, was carried as far with a child in his arms, and knows not how he got to where he recovered consciousness, beside a stump. The child is getting well and he, too, is somewhat better. The only signs of where the house stood are a few stones that mark the site of the chimney. The man's pants, with a knife, store key and 30 cents in the pockets, were found ten miles away. He had $3,000 in a trunk, $2,000 of which were in money, the rest in checks, etc. The lid was torn from the body of the trunk and swept away with the $2,000 in a pocket attached to it. Both were found a mile away, while the checks, etc., and the rest of the trunk have not yet been heard of. Next morning a feather bed was found seven miles off in the yard of a man who recognized the tick and returned the bed; while a shawl and a skirt were picked up eleven miles from the ruined homestead. Eight houses, in all, were demolished, and another neighbor of mine was killed and several wounded. Corn is worth 75c. to 80c. per bushel; oats, 65c.; eggs, 10c. per dozen; butter, 15c. to 20c. per pound. Everything the merchants bring down here is of inferior quality; many of the farmers have to mortgage their crops, and so soon as the store-keeper learns this, he stops credit; so that some folks here have to live on "mighty" meagre fare for a large part of the year. H. B.

NORTH CAROLINA, Brookston, Warren Co., April 29.—"Old winter still lingers"—not exactly winter, but since our big rain in March, we have had pretty cool and dry weather. We had snow on the 8th inst., and the mercury was down to 29 deg. on the morning of the 12th; but little injury was done to vegetation. Early Peaches were nearly all ruined before that time and the dry winds have swept away the remainder, with a few exceptions. We have fair prospects for our usual full crop of grapes. The showing for other fruit is fair, Strawberries are suffering for rain, which has just now commenced falling, and they are probably safe. Wheat is above the average both in acreage and appearance. Corn planted early in the month is coming on unusually well. More than the usual area will be planted in cotton. Fodder, owing to the short crop of last year and the late spring, is scarce and high in price—from $1.25, away up to $2.00 per cwt. Many farmers, the writer among the number, are obliged to allow their cows to range on the commons—result, one cow aborted, all are thin and the milk-pail light—it doesn't pay. In consideration of having discovered a land where the potato blooms and grows and flourishes, and can be eaten fresh from one and the same hill for nine months in the year, I move that the "Major's" S. C., friends be instructed to promote him a grade or two. Though military titles, except private, seem to be pretty nearly all appropriated hereabouts, please tell him to move along up this way and we will give him anything in that line that he may ask for, besides rendering all the aid in our power in the making of new discoveries.

M. B. P.

[The Major would be pleased to accept this friendly invitation were it not that "his foot once more is on his native heath."—EDS.]

The Querist.

ANSWERS TO CORRESPONDENTS.

[All queries must be accompanied by the name and address of the writers to insure attention.]

Guernsey Cattle.

G. E. N., Afton, N. Y. asks for a description of the Guernsey cattle—their size, color and butter qualities, and where they can be bought.

ANS.—Guernsey cattle are either bred or descended from those bred on the island of that name. The cattle on this island are distinguished from those on the adjoining islands of Jersey and Alderney by their great uniformity of color, being usually yellow with white markings, coarser hair, less delicacy of form and limbs and by their yellow muzzles, those of the Jersey being black with a white fillet around them. The Guernseys are a trifle larger than the Jerseys and their butter qualities are as good, though as yet they have not, in individual instances or in herds, equaled the latter in amount of production. The earlier importations of Jerseys into this country had Guernsey markings and the buff nose occasionally re-appears in the progeny of the purest-bred Jerseys: but of late the line of demarcation between the islands has been drawn so close that there has not been for years, nor can there at present, any intermingling of the two breeds. Within a year or two past the Guernsey breeders in the United States have formed an association similar to that of the "American Jersey Cattle Club" and publish a Herd Register. Messrs. E. F. Bowditch, South Framingham, Mass., and Charles M. Beach, of Hartford, Connecticut, were early importers of Guernseys and usually have a good stock on hand, and will give any information to inquirers. There are also several prominent breeders of Guernseys in the State of New-York as well as at the West. The prices are about the same as those of Jerseys, from $150 to any sum above that, that fancy may suggest.

The Centrifugal Creamer.

J. F., Buffalo, N. Y., asks, 1, for information as to the new process of separating the cream from milk, by the Centrifugal Creamer; 2, where such business is carried on; 3, is it a success; 4, what is the cost of the machine.

ANSWER BY PROF. L. B. ARNOLD.

The last annual Report of the American Dairymen's Association contains the most complete account of the working of the Centrifugal Creamer I have seen published. This report is sold for the benefit of the Association by T. D. Curtis, Sec'y, Utica, N. Y., for 25 cents a copy. The machine is in use by E. Burnett, Southboro, Mass., and for sale by Whitman & Burrill, Little Falls, N. Y., of whom special information can be had by mail. I have seen this machine in operation at different times, and have carefully noted its peculiar work. It is a cream and milk purifier, as well as a separator. By exposing the cream, as it is separated, in the thinnest imaginable strata to the strong current of air occasioned by the rapid rotation of the machine, all foreign odors are carried away and the ripening necessary for easy churning and for hightening the flavor of the butter, is obtained instantly, instead of by long exposure to the air. All dirt and dust or other impurities heavier than the pure liquid milk, are, by centrifugal force, separated by being thrown to the side of the vessel containing the rotating milk, and held there, leaving the skim-milk cleaner and purer and sweeter than it can be obtained by any other means I know of. I have no doubt of the superior work of the machine, but there stand opposed to its general introduction the cost of the machine, and the motive power and skill to run it.

Norway Spruce Hedges.

G. W., Rock Fall, Ill., says that quite a number of Norway Spruce hedges have been planted in that vicinity, and he asks, 1, within how narrow limits can such a hedge be made to flourish for ten years; 2, can it succeed as an ornamental hedge in the shade of street trees or by the side of a fence; and, 3, would Arbor-vitæ be better under the same circumstances.

ANS.—1, That is optional with the owner. The Norway Spruce will bear quite severe trimming, and by judicious use of the shears the hedge may be kept from increasing more than about six inches in width each year. 2, No; the hedge may grow in the shade; but as an ornament it will not be a signal success, particularly if it, in addition, is hampered by a fence, on one side. In a dense shade the growth will be less compact, and the needles will fall off before their time; this may be ascertained by examining the inner and lower branches of any compact Spruce. Arbor-vitæ will do no better than the Spruce; it is of a slower growth and is less efficient as a fence. The best evergreen to plant in such a place would be the Hemlock—Abies Canadensis.

Lump in a Horse's Throttle.

L. H., Davenport, Ia., asks how to treat a horse with a lump, the size of a fist, on one side of its throttle—in other respects the animal seems in good health.

ANS.—This is a case of enlarged thyroid gland, due generally to some constitutional or local derangement, owing, maybe, to drinking gypsum-impregnated water. Give half a drachm of iodide of potassium mornings and evenings for a week in the drinking water, or dissolve it in a little water and mix it in the food. Clip short the hairs of the affected place, and apply every evening a part of an ointment made of two drachms of iodide of potassium and ten drachms of weak mercurial ointment. If the skin becomes sore or flakes off, discontinue this application for a few days or a week. The treatment may have to be continued for a few months before a cure is effected; should the treatment fail, the gland may be removed by a skillful surgical operation. Now will our correspondent tell us the precise size of a fist?

Chicks Dying in the Shell.

W. M., Wellington, Kan., has so far this year set eight or nine Light Brahma hens, but has had poor luck in getting a brood; as the chicks die in the shell, being unable to get out. The "skin" of the egg seems to draw like rubber over them, and he asks the cause and a remedy.

ANS.—The failure of the chicks to extricate themselves from the shell is probably caused by insufficient heat or moisture—most likely the latter. Moisten the eggs, on the 17th and 19th days of incubation, with warm water sprinkled into the nest—not too much. This will help to soften the shell. The drawing tightly of the skin over the chicks imprisoned too long in the shells, is due to the skin drying. Should the shell break and let the chick out at the natural time, there is then just sufficient moisture; should the chick fail to come out of the shell at the proper time, the skin naturally dries up over the little thing.

Miscellaneous.

N. E. B., Johnson's Junction, Ky., asks, 1, whether growing flowers in the house is injurious to the health of the inmates; 2, what is the design of the New York Flower Mission; 3, will any other cause than accumulation of blood cause congestion of the lungs, brain or other parts of the body.

ANS.—1, The presence of growing flowers in rooms is not perceptibly harmful or otherwise to the health of the inmates, provided the pots be kept clean, the soil be not permitted to become sour or water-soaked, and the rooms be properly ventilated. 2, The mission of the Flower Mission in this and other cities is, primarily, to supply the pleasure of flowers to poor sick people at their homes, or, oftener, in the hospitals and other public institutions. Here, however, they combine with this, religious exhortation and psalm-singing, together with little presents of an orange, an apple, or a nut, to such invalids as will accept it in the hospital wards. Their visits give a two-fold satisfaction by causing a ripple of excitement in the monotony of a sick room, and a pleasurable sensation to the visitors in sight-seeing and the belief that they are doing good at a very cheap rate. 3, Congestion, strictly speaking, is an accumulation of any liquid in any organ or tissue, but its meaning is generally limited in medical works to an abnormal amount of blood in the vessels of a part otherwise healthy, due, in most cases, to an enlargement of the minute arteries and capillary blood vessels. Congestion may also be passive from obstruction to the circulation from external or constitutional causes. The highly vascular organs, and those that receive the blood most directly from the heart, such as the brain, lungs, liver and spleen, are the most frequent seats of congestion; but the capillaries, spinal cord, and viscera are also often affected by it.

W. H. J., Newark, N. J., asks, 1, whether we have used the Mapes' potato manure, and, 2, with what effect; 3. how to treat corns on a horse's foot.

ANS.—1. Yes. 2. Good. 3. The subject of corns on a horse's foot was fully discussed as late as in our issue of March 20. Once more we urge upon our readers to preserve the various numbers of the RURAL so as to form a goodly volume at the end of the year. Our index will then show where articles treating on all, or nearly all, subjects of interest to farmers can be readily found. Such a work will be useful not for a month or a year alone, but for a lifetime. Many who throw aside each paper after reading parts only of what has cost much care and study, have no idea of the mass of varied information contained in a yearly volume. Regard for the interests of the great bulk of our readers, to whom our space belongs, must prevent us from discussing the same features of a subject at brief intervals, however willing we may be to oblige an individual correspondent, and we are continually receiving so many tokens of friendliness from our subscribers, that we are always disposed to reciprocate the good-will of every one of them. In the present case we repeat:—put a sole-leather shoe under the iron shoe and stuff under the leather with tow soaked in glycerine to keep the sole cool and moist. If the sole is very tender, the feet should be prepared for shoeing by keeping them upon a puddle of wet clay for a few days and by frequent dressings of cold water and by giving the horse a cooling medicine, such as eight to twelve ounces of Epsom salts.

S. K. R., Samsonville, N. Y., has a compost heap the basis of which is about a ton of barn-yard manure; during the past winter there have been emptied upon it all the urine from the house, the soap-suds on washing days, the salt and pickle from the pork barrel—making in all about two bushels of salt, besides some brine from the pork and fish of a friend in the village, and some wood ashes. He says that some of his neighbors now say it will ruin his crops if he applies it, and he asks whether it would injure corn and potatoes to use it upon them.

ANS.—It is a good compost for almost any crop; and it would be well if more of our farmers utilized in this way more of the valuable fertilizers that are generally considered waste refuse about the house. It can be used either in the hill, drill or broadcasted. The only risk in its use would arise from a possible excess of salt, but even this risk, which is extremely slight, can be avoided by spreading it over a somewhat larger area than it would cover if no ghost of a risk existed.

B. A., South Lowell, Ala., sends us a piece of a diseased apple tree branch and wants to know what ails it.

ANS.—The branch sent is affected with what is called twig-blight. It attacks the young shoots which, early in the season, wither and turn brown. The cause is unknown. The remedy consists in cutting away the diseased portions as soon as discovered. We have found that to all appearance a similar disease is very apt to attack the growth of the Apple and Pear, and more especially the Grape-vine, when during the late winter and early spring they are exposed to sleety weather, and the ice that thus forms on the branches is allowed to remain till melted off by the sun.

W. L. N., Newark, O., asks, 1, what we think of a specified cow-milker; 2, what are the ingredients in the Perfected Butter color, and whether it is harmless.

ANS.—1. Not having tried the cow milker we cannot give an opinion; to give an opinion of anything of which we have no actual experience is a risk we are averse to take, but would especially avoid it in regard to artificial cow milkers. 9, The Perfected Butter color has annatto for its basis. This substance is perfectly harmless and the very small quantity which enters into the butter, about one grain to the pound, or one part in 7,680, is an additional security against any possible injury.

A Subscriber, Woodstock, Ill., asks whether vinegar can be made from wild Crab apples.

ANS.—The juice of wild crab apples is bitter and acid; and without sugar, it is unfit for making vinegar. Vinegar is a product of the fermentation of juice containing sugar, and no liquid devoid of saccharine qualities can produce vinegar.

J. McG., Windsor, (one of the 23 in the Union) asks for the address of a firm who manufactnre wire-fence.

ANS.—Washburne, Moen & Co., Worcester, Mass.

E. A. S., Wellman, Iowa, wants to know where a Chinese yam can be had.

ANS.—Almost any nurseryman can supply it.

The Poultry Yard.

THE BEST POULTRY FOR THE BOSTON MARKET.

IN my opinion there is as much money lost by not selecting the right kind of poultry, by each for his own market, as by bad handling. I am not acquainted with any large market except Boston; but as a good deal of poultry comes there from the North and West, information with regard to the kinds wanted may perhaps benefit many readers of the RURAL.

And first as to chickens:—they should be yellow-fleshed, large and fat. The Asiatics fill these requirements best, and among them the best are the Light Brahmas. The Cochins are too thin on the breast, though when alive they present a wide front; but this is made up of feathers, not meat, and the old hens often have an unsightly bunch of abdominal fat projecting out behind, which looks as much out of place as that on the fat-tailed sheep. There is perhaps no chicken better than the Plymouth Rock to be killed when three months old; but after this age chickens of this breed begin to grow pale in color, while the Light Brahmas are in perfection from four till eight months old, when, if they have been well cared for, they are fit food for a king or a farmer—I don't know but the farmer should come first, as the more useful and ancient member of society. Whether there is any pe-

culiar taste to the yellow color or not, I am unable to say; but as long as epicures are willing to pay for it, it will not be best to question their judgment. Another point in favor of Light Brahmas is the color of their feathers—the whiteness of these gives the bird a neater look when plucked.

The best geese are produced by a cross with an Indian gander and Bremen goose; the offsprings grow larger and fatten better than either kind when kept pure. Most breeders here mate up their breeding flocks in proportion of three geese to a gander. The first eggs are set under hens, the second setting is placed under the old goose, though some make her lay a third litter. When the goslings are about three months old they are shut up in pens and fed on corn meal, beef scraps and whole corn (the latter being the last feed at night), for about four weeks, and are allowed all the water they want to drink, but not enough to play in. At the end of this time they are generally fat and heavy.

In marketing geese from July until October they are not drawn, nor are the heads cut off; as fast as picked they are thrown into a tub of cold water and remain there until morning, when they are boxed up and sent to market. In plucking ducks and geese, pull the feathers from the head towards the tail; in picking fowls and chicks, pulling them the other way will be best.

In regard to turkeys, I know of no better kind than what are here called the Rhode Island Black. They are large enough, healthy, fatten well, and their skin is yellower than that of any other kind with which I am acquainted. A *few* extra-large turkeys will bring an extra price during holidays: but if all go to raising thirty-pound turkeys they would not be worth as much as small ones. The best management of turkeys I have found to be to feed well from the beginning; and about the middle of September take extra care of them. Have ready for them, soon after day-light, a feed of corn-meal mixed with boiled potatoes, pumpkins or turnips mashed together while hot, and fed warm; give them all they will eat up clean; repeat this at noon, and at night give them all the sound yellow corn they will eat up, and you will have some nice turkeys for Thanksgiving, if they were not hatched too late. The late ones should not be sent to market until New Year's.

Bristol Co., Mass. THEO. G. LINCOLN.

A JEALOUS GOOSE.

SOME weeks ago two of my geese were sitting close together, their nests being not over 12 inches apart. They had chosen these positions and I made them comfortable there. There was a difference of about three days in the period of their hatching. Each goose was regularly mated with her gander, and the careful husbands each watched faithfully over his own spouse during the month. The first goose hatched eight goslings, and now comes the catastrophe. The mate of the goose that had three days yet to sit, was so "taken" with the goslings that, deserting his sitting spouse, he devoted himself to the aid of the fortunate pair that had already begun to enjoy the cares and pleasures of pat- and mat-ernity, becoming a sort of loving stepfather to the young brood. At this infidelity his goose was very much worried, and would quit her nest and follow him about, now querulously, now caressingly trying to induce him to return home and watch and wait as had been his wont for nearly a month. As I saw that he was a hardened deserter, and that he was doing a world of mischief to the expected brood by tempting the mother to abandon their care while following his faithless footsteps, I arrested and imprisoned him out of sight. Thereupon the sorrowing mother returned reluctantly to her duty, and in due time the brood of goslings began to come forth. But the mother was outraged and wrathful. No father to share her joys and cares! No marital help or caresses for the little ones or their ma! Brooding on this angered her mightily, and a more furious bird I never saw. With deep interest I watched her. No sooner would a gosling peep from the shell than she would pounce upon it, toss it about and follow it up until it was "deader than a door nail." Then she would grimly return to her nest and await for another to come forth, when she would repeat the same cruelty. After a couple of furious exhibitions of this kind, I took the remaining eggs and put them under a hen, but only one hatched. The goose finding nothing of her own and husband's left to vent her indignant fury upon, hunted up the rival whose better fortune had seduced her husband, and would, I am sure, have destroyed her brood also, had I not interfered. The jealous madam and her faithless partner are now ignorantly happy in the fattening coop. C. M. D.

Galveston, Texas.

Cost of Keeping Hens.

I am frequently asked the question, "What does it cost to keep hens." By referring to my books, I find that the cost for feeding 140 hens the six months, commencing Sept. 1st, 1879, has been as follows:—

94	bushels	wheat screenings	$42.30
10	"	corn	6.45
8	"	carrots	2.40
7	"	buckwheat	4.20
1	"	onions	1.25
590	lbs.	tallow scraps	6.45
110	"	corn-meal	1.10
120	"	barley meal	1.33
		cayenne pepper	.25
		Total cost	$65.76

This is 47 cents per head for the six months. As the hens can pick up a share of their living for the remaining six months, perhaps 80 cents are a fair estimate of the average cost of their feed for one year. Of course, the cost will vary somewhat in different localities, owing to the variation in the price of grain, etc.; but I think my estimate sufficiently accurate for all practical purposes.

In raising chickens I find that it requires more food to grow a large, than a small one; but after being fully grown, and when laying has commenced, I discover very little difference in the amount of food required by the different breeds. Hens that lay best should eat most. NELSON RITTER.

FOUR-TOED HOUDAN FOWLS.—We notice the French are selecting such to breed from in preference to the five-toed. This is a sensible move on the part of poultry fanciers. The fifth toe is a mere ugly excrescence of no use whatever, and it is only a waste of precious food to grow it. We may say the same of the Dorking fowl, and wish the English in breeding these hereafter, would follow the excellent example set them by their Gallic neighbors.

The Apiarian.

FEEDING BEES.

THERE are bee-keepers who say: "Better keep no bees than to feed them!" There are others who think they have done enough if, once a year, when the time of greatest need comes, they remember these little creatures with a small portion of honey, or sweetened water, or a piece of candy. But there are also some bee-culturists in the world—and, thanks to the spirit of progress, their number is increasing—who feed during the whole year; that is, whenever it may be deemed advisable as a matter of profit. Brimstoning bees, really robbing them of their honey, and securing large yields in good seasons, cannot be termed scientific bee-culture. On the other hand, wintering bees successfully, and, in order to secure a surplus during poor seasons, such as last year, decreasing the number of colonies without killing any bees, may be said to combine the science and art of cultivating bees. Most novices in apiculture are impelled by a desire to increase the number of their colonies as rapidly as possible. To attain this result, some have recourse to artificial swarming; they divide, twice and even three times, colonies which often are already very weak; but instead of advancing, they go backward. Others resort to speculative feeding to stimulate the queen in her laying and to bring about the development of brood in order to obtain a large number of natural swarms. This latter method will produce the desired result, if it is applied with a proper understanding of the subject; and, above all, if it is employed at the proper time.

Feeding may commence in the beginning of May, to bring about early swarming. In movable frame hives, this is done by inserting full cards of capped honey, or, in case these are lacking, lukewarm sirup of the consistency of mucilage—two parts white sugar and one part water brought to a boil, and fed every three to five days. Bees, like human beings, like warm food better than cold, and in this condition they will the more readily accept the sweets offered them. When sirup is fed, the feeder should be placed at the entrance, and so arranged that the bees enter it readily from the inside of the hive, while outsiders and robbers are excluded. What takes place when bees are fed for the purpose of stimulation? They regard as the product of nature what the hand of man spreads before them; they hasten to leave their habitations and go outside in search of the sweet nectar. All goes well if vernal sunshine and gentle zephyrs favor their excursions; but if the weather is bad, if rigorous winds follow closely upon seductive sunshine, and overtake the rovers in the open field, the poor workers are chilled, the weak colonies rapidly depopulated, and the brood perishes for the lack of care, and finally the colonies succumb. Although so few bee-keepers think of feeding during May, June and July, yet such unfavorable weather often occurs that young swarms and nuclei should be looked after—it will be found to pay. During such periods feed as often as every fifth day. If the amount already in the hive is not sufficient, it is better to feed now rather than later. If one tries spring feeding, even on a single colony, he will find it to increase rapidly in numbers, especially if the queen is young and the colony has a fair number of bees to start with. J. G. BINGHAM.

Miscellaneous.

Trade **LONDON PURPLE.** Mark.

Valuable insecticide for the extermination of the COLORADO BEETLE, COTTON WORM and CANKER WORM. For Prices, Circulars and opinions write.

HEMINGWAY'S LONDON PURPLE COMPANY, (Limited) 90 Water St., New York.

Professor C. V. Riley says: London Purple can be more effectually sprinkled or sprayed on to the plant than Paris-green, by virtue of its greater fineness.

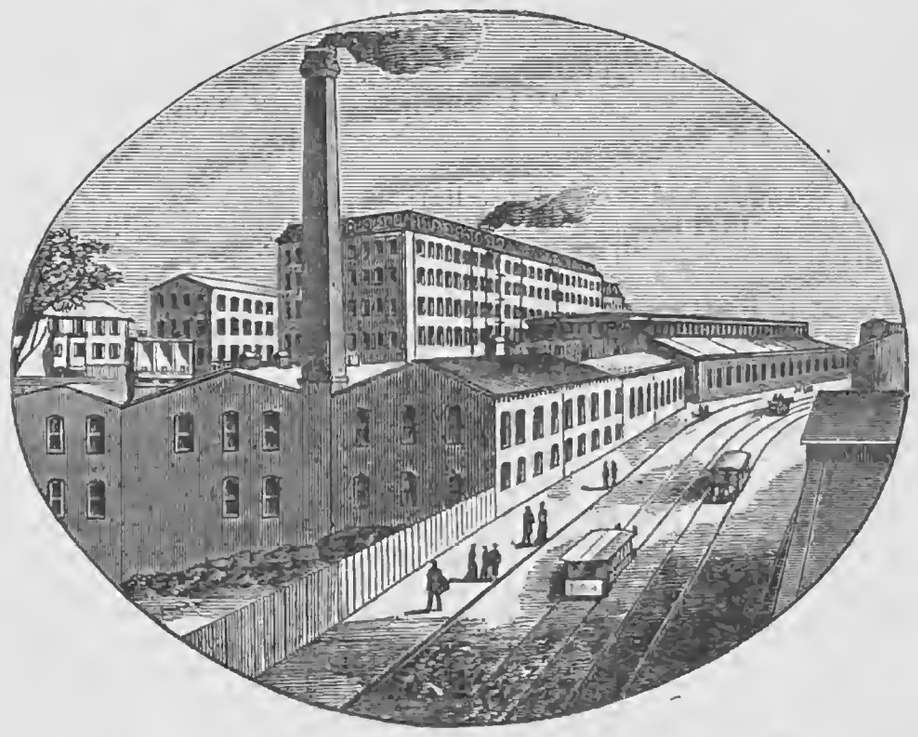
Professor C. E. Bessey says: It promises to be a most excellent remedy. It quickly kills both the Larva and the Winged Insects.

Professor J. L. Budd says: A single application placed every one of the pests on their backs over the ground, either dead or in a dying condition, in less than six hours.

CARPETS.

SAVED BY PURCHASING DIRECT FROM

INTERMEDIATE PROFITS.



THE MANUFACTURERS.

We have now open an immense stock of the most approved varieties of CARPETS and FLOOR COVERINGS

MANUFACTURED BY OURSELVES

Expressly for this season's Retail Trade, consisting of AXMINSTERS, WILTONS, VELVETS, BRUSSELS, INGRAINS, &c., &c., in

New Styles and Designs.

These goods will be found to combine in an unusual degree, Elegance of Appearance and Positive Wearing Qualities, and are well worthy of the inspection of intending purchasers.

We also offer a Full Line of TURKISH and EAST INDIAN RUGS and MATS, CHINA MATTINGS, OILCLOTHS, &c., &c., AT THE LOWEST POSSIBLE PRICES.

Special Inducements offered to Churches, Steamers and Hotels.

J. & J. DOBSON,

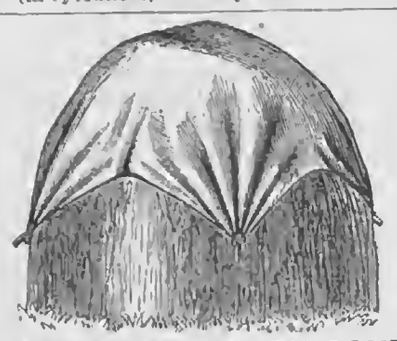
CARPET MANUFACTURERS AND RETAILERS,

40 & 42 WEST 14th ST., N. Y., Near 6th Av. Elevated R. R. Station

JOHN VAN GAASBEEK, Manager.

The Aquapult (in operation.)

W. & B. DOUGLAS,
Middletown, Conn., U. S. A.
BRANCH WAREHOUSES: 85 & 87 John St., N. Y., 211 Lake St., Chicago, Ills.
Manufacturers of
PUMPS.
Hydraulic Rams, Garden Engines, Pump Chains, Curbs, etc.
Highest Awards at all the World's Exposition.
WORKS FOUNDED IN 1842.
The cut represents our **Aquapult** a newly-improved brass hand force pump. Fire Extinguisher, Garden Engines, Window and Carriage Washer, will throw water 60 ft. Sent to any address C. O. D., price $9. Illustrated Catalogue on application.



HAY CAPS AND STACK COVERS,
Tents, Awnings, Covers
FOR
Horses, Wagons or Goods.
And Everything Made of or Finished with Cotton Duck.

FLAGS AND BANNERS
OF SILK OR BUNTING,
FOR ANY SOCIETY OR NATIONALITY.

INGALL'S PAT. LINK AND CHAIN

Will make or mend your chains, of all sizes, without tools. Inquire at your Hardware store or address

INGALL'S MFG. CO., Providence, R. I.

AGENTS WANTED EVERYWHERE to sell the best

Family Knitting Machine ever invented. Will knit a pair of stockings, with HEEL and TOE complete, in 20 minutes. It will also knit a great variety of fancy work for which there is always a ready market. Send for circular and terms to The Twombly Knitting Machine Co., 409 Wash'g'n St., Boston, Mass.

THIS NEW
ELASTIC TRUSS
Has a Pad differing from all others, is cup shape, with Self-Adjusting Ball in center, adapts itself to all positions of the body, while the Ball in the cup presses back the intestines just as a person would with the Finger. With light pressure the Hernia is held securely day and night, and a radical cure certain. It is easy, durable and cheap. Sent by mail. Circulars free.

EGGLESTON TRUSS CO., Chicago, Ill.

HIGH CLASS POULTRY, Grape Vines, Small Fruits, finer than ever. Send for circular. GEO. S. JOSSELYN, Fredonia, N. Y.

IMPORTED CLYDESDALES
ALSO,
HAMBLETONIANS,
and other desirable strains of Trotting Stock, for sale, cheap, and on easy terms. All stock guaranteed as good as represented. Catalogues sent free Correspondence solicited. Address
POWELL BROS.,
Springboro, Crawford Co., Pa.

THE ISBELL
MOLE TRAP
IS INFALLIBLE!!
IT NEVER FAILS to catch and kill. Lawns, Gardens, Parks and Cemeteries cleared of this aggravating pest in short order, by using this trap. Can be set in an instant by any one. Does not get out of order. PRICE, $2.00 EACH. Sent by express on receipt of price, by
YOUNG & ELLIOTT,
12 CORTLANDT ST., NEW YORK.
Wholesale and retail catalogues of reliable seeds free by mail, on application.

AUTOMATIC FRUIT **EVAPORATOR.** The Cheapest and best in market. For cut of Evaporator and Descriptive Circulars, address, DODGE & HINCKLEY, Fredonia, N. Y.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

CONDUCTED BY
ELBERT S. CARMAN.

Address THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, MAY 15, 1880.

CHEERFULNESS is the daughter of employment. Says Bishop Horne, "I have known a man to come home in high spirits from a funeral, merely because he had had the management of it."

OUR contributor, Dr. J. B. Lawes, of Rothamsted, England, in a late private letter to the RURAL NEW-YORKER, states as follows:

"We had a wonderfully dry spring and one well suited to get in our crops; but the wheat does not look well, and we shall require a large foreign supply."

WE have just been reading in the columns of a widely-circulated journal, that the most promising of the new fodder plants are Pearl (Cat-tail) millet and Doura, called also Egyptian corn, China corn, Pampas rice, etc. It is painful to those who really have the good of agriculture at heart and who have tested those plants, to see such reckless and mischievous commendations. All but one (possibly two) of the Douras send up but a single stalk, and are far inferior to Indian corn as fodder plants. Cat-tail millet for the North, is little less than a humbug.

SIXTY-ONE horses bred by the Earl of Ellesmere, on his estate of Worsley Hall, were recently sold at auction by his agent, Capt. Heaton. Brood mares went from 58 to 170 guineas ($290@850); fillies from 27 to 280 guineas ($135@1,400); stallions 85 to 320 guineas (425@1,600); entire colts, 40 to 280 guineas ($200@1,400). The average of the 61 horses was about $600—a well paying price for cart horses; as it is little more trouble to breed and rear them than cattle, they are so gentle and, on the whole, probably no more expensive; for the colts are so powerful they can be put to gentle work on the farm or road at two years old; the mares can be used almost to foaling time, and begin again a few days after foaling, while the stallions are all the better for constant labor, except during the breeding season, and even then they may be worked prudently about half of each day.

IT very frequently happens that young pear and other fruit trees blossom and, if permitted to do so, bear fruit the same season that they are planted. We have had the blossoms and fruit of such trees pointed out to us as evidence that the trees were thriving particularly well. Such evidence, however, is indicative rather of weakness than of vigor. There is nothing more harmful to young trees than to permit them to bear fruit the year of transplantation. Even for dwarf Pears, the third year is soon enough for them to bear, and the sixth year is soon enough for the generality of standards. Our readers will find that if they suffer young trees to mature fruit the first or second year, their vigor will, in most cases, be impaired for ever after, and having borne at this early age, they will not, as a rule, bear again in five or six years afterwards. The temptation to inexperienced fruit-growers to see their young trees in fruit as soon as may be, is considerable. It is because *we* yielded to such temptations, that we are now able to guard our readers against falling into the same error. Fruit-bearing is an exhausting process, and only trees that have arrived at a certain age or maturity can exercise the function without endangering their health and strength.

A CAPITAL idea has occurred to the managers of the Agricultural Society in Washington Co., Maryland. Instead of offering money premiums of one to five or six dollars for the exhibits, they have decided upon the plan of offering a choice among a few first-class agricultural journals, for which the association will pay the subscription for one or more years, according to the value of the premium. This is an example worthy of imitation. It is the best possible way of benefiting the prize-takers, as the premium itself gives instruction in the calling in which they are striving to excel. A silver chalice, with engraved monogram, may form a handsome and very acceptable premium, which the housewife who recieves it for the superior quality of her butter and cheese, or the farmer who wins it by raising the largest yield of grain to the acre, or for having the best pigs, sheep or cows, can treasure up as a pleasing memento of victory, but practically it is of no use except as an ornament. If the premiums, on the other hand, consist of money, it is generally the case that it is less profitably invested than by subscribing for an agricultural journal. We hope that this idea will prove to be catching, and that other Societies will adopt the same plan, not so much for the increase it is likely to give to our subscription list, as because an agricultural paper is a most benefical and suitable premium for agricultural products.

BEFORE the New York Legislature there is now a bill, called the Hepburn bill after its introducer, whose object is to put an end to the unfair discrimination in freight charges made by our railroads in favor of certain persons and places to the injury of the general public. From one end of the country to another complaints are high and deep of the abuses, in this direction, of the privileges granted to railroad companies by the public for the public benefit; but which have been perverted to the public disadvantage. This bill ought to pass, and those among our law-makers who oppose the just measure should be held in unfavorable remembrance at election time. We learn, however, that from most of the large towns through which railroads run, prominent business men are flocking to Albany to oppose it, and that the lobby that is scheming against it, is unusually busy and flush. Among the opponents of the measure there are few who are not directly or indirectly privately benefited by the public grievances it seeks to remove. Those merchants who are plotting against its passage have in nearly every case contracts with the railroad companies at exceptionally low rates, which give them unfair advantages in trade over their fellow townsmen in the same lines of business. Whence comes this right arrogated by the railroad companies to "build up" the business of certain places and certain men to the detriment of other men and other places? What rights the companies have were conceded to them by the People for their own benefit, and this certainly was not at first among them, nor do we remember that the People have ever since been foolish enough to add it to the original concessions. It is a grievous abuse that should be at once redressed. Even if the measure referred to, passes it will only place the present privileged classes on an equal footing in the race for wealth with their fellow citizens, a position which no fair-minded man should object to in a Republic.

AT this lively season our friends are mostly too busy to contribute largely to their favorite "Everywhere;" but from telegrams to the New York papers and other sources, we learn that rains have lately been general throughout the West from Texas to Minnesota, just in time to dissipate fears of drought in many places, to push on wheat and oats, and help crops of all sorts. Wheat is unusually advanced in quite a large number of places, such reports being specially noticeable from southern Illinois, Missouri, Texas and Georgia, some of it having been cut as early as the 1st of May in some parts of the last State, while in the neighboring State of South Carolina, although the spring was earlier than usual, the crops are said to be a fortnight later. All along the Ohio Valley the prospects for winter wheat are reported fine, and, indeed, all the reports we have seen from every section speak more or less enthusiastically of the outlook for it, though in several places the season is decidedly backward. This is exceptionally the case in Minnesota, but the outlook even there for wheat is reported good—that is, for the spring varieties. The cotton crop is, on the whole, in a fine condition all over the South, and the high prices of last year have stimulated the planters to put in a considerably larger acreage than usual. Accounts from the Southern tobacco fields, however, complain of a rather poor outlook, especially in Virginia, where the fly is particularly busy and numerous. There will be, most likely, a good yield of peaches, the reports of utter ruin to the crop, even from Delaware, having this year been much milder and fewer than usual, while some accounts venture to speak even buoyantly, especially those from the West and South—a rare exhibition of confidence from the peach regions. Where strawberries were nipped by the frost, the second bloom is producing a good crop, and there is little danger but our markets will be abundantly supplied. Apples, Pears, Cherries, and especially Grapes, seem to be "putting their best leg foremost" on the march to an abundant harvest, and, so far as quantity and quality of products are concerned, the farmer can, from present indications, sing hallelujah—but, by way of caution, how about prices?

BREVITIES.

OUR usual "comic" on the last page is omitted this week to accommodate our advertising patrons.

FRIENDS would oblige us and insure for themselves answers more promptly, if they would send all questions pertaining to Domestic Economy to Mrs. Emily Maple.

IN the use of the concentrated fertilizers, we oblige our hands to mix them with an equal bulk of *moist* (*i. e.*, not dry) soil. This insures against some loss. They are not blown so far off by the wind and the distribution is more equal.

THE Pacific Rural Press, we see, gives Ellwanger and Barry's cut of Souvenir du Congres Pear. But the Press is wrong in saying that it has just been made public. The RURAL NEW-YORKER gave its own illustration of this pear over five years ago.

THE oleomargarine men are just now spending a "mint" of money in advertising their concoction. Well, they ought to be able to afford a good round sum, as they sell for butter prices what costs them about 10 cents a pound, according to some estimates.

A FACT worthy of note is one stated in the London Agricultural Gazette. A writer states that he commenced cutting Prickly Comfrey on the 23d of April for two dameless young lambs about 18 days old, that *would eat nothing else*. They ate it greedily at once!

RURAL FARM, Long Island, N. Y., May 8.—Weather rather dry. Grass is growing finely. Wheat never looked better. We hope to have interesting reports to make respecting our 25 varieties. We are now preparing the ground for comparative tests of many new sorts of potatoes.

OF the little orchard of forty dwarf Pears and Apples (Apples on Paradise stock), which we planted at the RURAL'S Farm last fall, not one has been injured in the least by the past winter. Years ago our experience in fall-planting was very different. A large proportion were injured—some killed. But the winter was a severe one.

IT may now be seen that many of the agricultural journals who were at pains to speak of Commissioner Le Duc as a fool, etc., for his advocacy of the Northern sugar industry, are now urging farmers to plant Early Amber Cane. But we have not seen that they have apologized to the Commissioner, or acknowledged that in this instance they were themselves the fools.

ALEXANDER DELMAR, the statistician, shows that from 1848 to 1856, it cost an outlay of $2,256,000,000 in capital and labor, to dig $450,000,000 out of California mines—a poor show for the mines, that! The same vast outlay invested in digging the soil with the rudest of our modern agricultural tools, would have made a return of—how many more hundreds, aye, thousands of millions?

BAD news comes from the tobacco fields of Virginia. Intelligence received in Petersburg on the 6th inst. from different sections of the State, reports a greater scarcity of tobacco plants than has been known for a number of years, while those growing are being rapidly destroyed by the tobacco fly. So discouraged are farmers that in many cases the ground prepared for tobacco is being planted with corn and peas. Not more than one-fourth of the usual crop is expected to be made this year.

THE extraordinarily large number of immigrants settling among us this year, must add considerably to the home demand for farm products of all kinds, inasmuch as very few, if any, of the new-comers will be able, the first year, to contribute materially towards raising their own sustenance. It is reasonably estimated that, during the twelvemonth, an addition of at least 300,000 will in this way be made to the mouths that will have to be fed within our borders—a goodly army it will require heavy requisitions on our commissary stores to maintain.

IN the RURAL of April 24, appeared an editorial article headed "How to Buy a Horse," written at the result of our thoughts upon the points to be observed in an intended transaction of that sort. The article has been pretty widely copied by our contemporaries, but in very few cases has due "credit" been given to this paper. While some have assigned its origin to other papers, others have boldly appropriated it as orignal matter. A little more care, gentlemen editors, a little more care in giving "credit," or a little more honesty—unless the mistakes were due to that scapegoat, the compositor.

HORSES, if well bred, and kindly broken, and not over-fast driven, or strained at heavy loads before eight years old, are in their prime from that age to 16, and serviceable on till 24 to 30 years of age. We have seen horses at these later ages, when properly used, which appeared more like colts than aged animals, and were still equal to a good day's drive on the road or work on the farm. A friend of ours kept a saddle horse till past 45 years of age, and he was still an active traveler. He probably might have done good service till 50 or more, had he not been accidentally killed. If you wish to obtain serviceable horses to the above ages, be very careful in breaking and using them till eight years old. At this age bone and muscle have attained their full strength, and horses may with impunity be worked harder than when younger.

ON Friday last the first barrel of flour from *this year's* wheat crop, reached this city from Americus, Ga., and was sold by auction at the Produce Exchange for $15. It will now be sent to Liverpool, where it will be resold in the same way, the proceeds to be devoted to the repairs of the Episcopal Church at Americus. Considering the remarkably early date at which the product came to market, and the worthy object which its price is to benefit, it seems to us that the members of the Exchange were very tame in their "bidding"; surely here was a splendid opportunity for vigorously "bulling" the flour market.

IN the nine months ending March 31 last, our aggregate exports of wheat and of flour reduced to wheat, from all the Atlantic ports, amounted to 118,840,522 bushels, against 95,864,254 during the corresponding period last year. Their declared value was $147,324,771, against $103,143,510 last year. The vast preponderance of our wheat exports over those of all other breadstuffs, is shown by the fact that the total value of the latter was only $35,307,455, making the aggregate of all our exports of breadstuffs, $182,632,226, against $132,032,530 last year—an increase of upwards of $50,000,000, with greatly increased exports from California and Oregon not included.

WE have of late received so many packages of plants and seeds to be tested in our Experiment Grounds, that we have not attempted to acknowledge their receipt by letter. Those who have sent them, however, may feel assured that we shall try all that seem to be worthy of trial, and that we shall report upon all that prove of special value. In the case of Grape-vines, we have been requested to return in the fall the season's growth of cane. This we cannot agree to do. We have also been cautioned against giving away or selling buds or cuttings. We can only repeat what we have grown tired of repeating, viz.: that we have never sold cuttings, buds, seeds or plants of any description, and we hold that we have no right to give away plants sent to us to be tested, until such plants are offered for sale generally.

THE Chamber of Commerce of this city is petitioning Congress to remove the import duties on salt, and similar bodies in other cities either have already sent like petitions to Congress, or intend to do so. There is little doubt but that the request will be granted. Now let the Legislature of New York State remove the odious tax it has imposed on foreign salt in the shape of discriminative canal freight, in favor of the Onondaga Salt Works. Wherein lies the equity of taxing the farmers and other residents of Western New York and of all the Western States for the benefit of this company? Outside of the railroads, there is not a corporation in the State that has done more to corrupt our Legislature, through means of a powerful Albany lobby. Doubtless it is to this nefarious influence, that the imposition of this hateful tax and its continuance, are due. How long shall its baneful incentives pervert legislation?

A BILL is now before the California Legislature imposing a tax, in the shape of a license, upon every bull, jack or stallion kept for the purposes of propagating their kinds. The name, age, pedigree and classification of each animal are to be recorded, and the record must be open to public inspection. The sum realized from the licenses is to be paid into the "Stock Breeders' Fund," which is to be distributed as premiums on stock at exhibitions to be held at the annual State fairs, after a deduction of $500 salary to be paid to an officer having charge of the distribution of the fund. The passage of such a bill should be strenuously opposed by all who desire the improvement of the live stock of the State and the consequent increase of its wealth. Instead of taxing the first-class males, it would pay the State to offer bounties for them, as is profitably done by the British Government of India, especially with regard to thoroughbred horses.

"THE Land of the Free and the Home of the Brave" seems destined to monopolize nearly all the exodusters from "effete Europe" this year. Of the 13,363 emigrants from Liverpool in March, 12,167 came directly to these hopeful shores; 812 went to British North America, but many of these, too, will come to the States either rightaway, or after they have become disgusted with their more northern homes, as thousands of Canadians, for instance, are becoming every month. Indeed, statistics show that the emigration from Canada to this country, is heavier than the immigration to the Dominion from the rest of the world. Of the rest of those Liverpool exodusters 170 went to South America, 28 to Australia, 67 to the West Indies, 62 to China and 36 to the West Coast of Africa. The total emigration from that port during the first quarter of this year was 23,764, an increase over the corresponding three months last year, of no less than 13,437!

ONE of the most interesting events in the horticultural world of late, is a sale at auction of one of the choicest collection of Orchids to be found on this side of the Atlantic. It was a private collection, belonging to Mr. Geo. Tweddle, of Albany, N. Y. The sale took place at the seed store of Messrs. Young & Elliott, Cortlandt St., this city. The collection consisted of 359 specimens in about 300 varieties, and brought a total of $6,500, or, on an average more than $18 apiece. The event had called together the most noted Orchid fanciers from all parts of the United States. We give the names of a few of the highest-priced specimens. Vanda Suavis var. Veitchii, was considered the choicest plant in the collection, and brought $250, and Vanda tricolor var. Corningii sold for $225; both were bought by Mr. Corning, of Albany, N. Y. Saccolabium guttatum Halfordiannm was bought by De Witt Smith, Lee, Mass., who paid $200 for it. The following were bought by Mrs. Morgan of this city, a lady who is noted for her excellent taste in matters of art as well as in the selection of plants: Cattleya labiata, $175; Angraecum Sesquipedale, $135; Odontoglossum Alexandria, $100; Odontoglossum vexillarium, $100. A large number of the plants brought between $30 and $50 apiece. These prices demonstrate that fanciers for really choice varieties are not lacking.

For Women.

CONDUCTED BY MISS RAY CLARK.

COLLOQUY WITH THE MAY BIRD.

BY MARY F. VAN DYCK.

"Sweet bird of May, what do you say
In your merry rounde-lay?"

Ans.—"I welcome spring, and love to sing
To every bud that's opening."

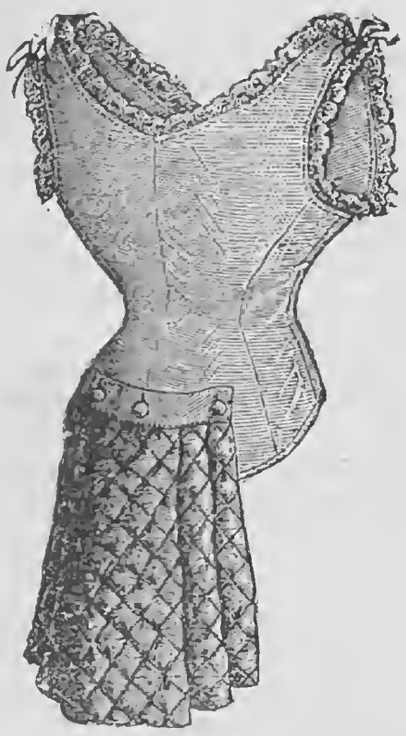

FIG. 165.

"Where do you go, I'd like to know
To hide from winter's frost and snow?"

Ans.—I wing my flight, on pinions light
Where southern skies are warm and bright."

"Why come again? Methinks I fain
Would ever in that clime remain."

Ans.—"Ah, friends are here, I loved last year
And you are one of them, my dear."

"Then why so shy? Come nearer by
And look me bravely in the eye."

Ans.—"I cannot stay, I must away
And line my new-made nest to-day."

"Nay, bide with me, and I will be
As kind, as kind can be, to thee."

Ans.—"And leave my mate, all desolate
Who now my coming doth await?"

"Nay birdie blest I was in jest,
I'm glad your love hath stood the test;
Ye powers above, grant one I love
May as this birdie, faithful prove!"

FASHIONS.

FIG. 165—UNDER-BODICE, WITH DRESS IMPROVER.

The bodice is of fine twilled muslin, trimmed with lace; the improver of satin or other material, well wadded and quilted. A corset-cover, or other under-waist pattern may be used. The improver can be cut readily without the use of a pattern.

FIG. 167—HOME-DRESS FOR YOUNG LADY.

The dress is of beige, trimmed with the same. There are many other materials suitable for making this dress. A combination of colors or goods would be as appropriate as to have it constructed of the same throughout.

FIG. 166.

FIG. 166 and 169, Bonnet of Old-gold colored Chip. (The back is shown in Fig. 169, the front in Fig. 166); The bonnet is trimmed with old-gold twilled silk strings of the same; a bouquet of tea-roses ornaments the sides; the bandeau is composed of tea-roses and forget-me-nots.

A WOMAN'S FIRST CORN CROP.

I HAVE thought it would be interesting to you to know what a woman accomplished with the Blount's Corn. My husband prepared a plot on upland prairie, half of the plot had been manured slightly, the other half had not received any manure, whatever. On the 3d of May last I gave the corn to one of the little girls to drop, and I took the hoe and made the hills and covered the corn, planting one hundred and twenty-two grains. In each hill on the part of the ground unmanured I put about half gallon of manure from where a straw stack had been eaten down, the other hills were planted just as the ground was.

A drouth followed, and some of the grains I soon discovered were perishing, and I began to carry water and put on the hills, afterwards sprinkling over the top some dry earth to prevent baking. One hundred came up and lived until the 29th of July, five were blown down and broken off in a storm.

On the 6th of June I carried chicken manure and put one-half gallon on each hill, in two weeks I put on the same again. During this time the corn had to be watered a great deal, for the drouth continued, and I was determined to win the laurels (if won) myself. I would not let any one haul the water (which might have been done) but carried it myself drawing it in the morning into a barrel and carrying it in the evening. This I continued until the corn was shooting ears, when we had a good rain.

The corn grew up ten to thirteen feet high and we had an average of three ears to the stalk. Aside from preparing the ground for planting and plowing the corn once, I did all the work, hoeing it well three times, and removing the suckers until reading in the RURAL that you intended to leave them on, I then let them grow.

FIG. 167.

I planted the corn inside of the prescribed space two feet all around. On the 1st of September we moved from the farm into town, to put our children in school, and just after we moved, two or three unruly cattle broke in and destroyed some of our corn and fodder, and this is the reason I did not report. On the 10th of September, Mr. Cone cut the corn and put into shocks.

In three months from that date it was shelled and weighed, and the result was 117 pounds of shelled corn and 19 pounds of cobs.

We all (and especially myself) were proud of the corn, and think yet that it did exceedingly well, though I was disappointed because of some of it getting destroyed and thus spoiling, as I thought, my chance for any premium, after all my hard work.

Please have patience with this—I fear—tiresome description of a woman's first corn crop. I *must not* intrude any longer on your time and patience. Let me tell you, however, that although we are citizens of Memphis and expect to be there next year anyway, we cannot do without the RURAL.

Memphis, Mo. MRS. M. C.

HELP FOR "FARMERINE."

I SYMPATHIZE with "Farmerine" in her perplexity, and as my principal business for years has been making "auld clois luik a'most as guid as indoors weather, but let it shine! And as it is new," perhaps I can help her with that "shiny" silk.

To tone down the "shine" get two yards of silk-finish velveteen, or the pretty and fashionable corduroy that looks and wears as well as real velvet.

Trim a walking skirt with alternate bias bands of velvet and silk. Commence the bottom of the skirt with velvet six inches wide. Gradually lessen the width of the bands until it is trimmed 22 inches deep. The suit may be finished with a a polonaise looped high in front and on the sides. A polonaise can be made of old goods easier than a basque, as it can be pieced without the seams showing.

The sleeves may be trimmed to the elbow with alternate folds of velvet and silk to match the skirt; make a collar of velvet extending to the darts in front. The sides of the polonaise may be trimmed with the velvet sewed in at the side seams and turned back with buttons. For girl's suits there is a pretty all-wool basket cloth, single width, in shades of blue and green, it is very stylish and pretty. It is sold at 50 cents a yard.

O. W. D.

To the lady who wishes to utilize her old black silk. If she will dip it in black dye, the same as if she was coloring goods of another color black, it will remove the gloss and make it appear more like new silk. If she could get two or three yards of the pretty satin-striped goods used for trimming this spring (it is inexpensive) she might get a dress and jacket both out of the old dress.

For patterns both Butterick and the Domestic are used, and if she is not so very skillful, she cannot help but get it right, as the patterns are true.

"CONSULTRIX."

CHEERFULNESS has been defined to be "sunshine in the heart." Don't keep it bottled up, in the largely a matter of physical condition, consider it duty to keep well, and don't set yourself up as superior to Mother Nature. Good eating, good sleeping, good air, and a habit of starting the day right and closing it well, will enable most people to be as sure of their supply of good nature as the farmer is of his winter stores. First among your house-plants, good wives, cultivate cheerfulness, chief est among your family supplies, father, plan to have amiability. As for the dear children, they take to merriness as naturally as a dog's tail does to wagging, if you give them half a chance.—Golden Rule.

PRESERVING LOCALITIES.

MARGARET B. HARVEY.

THERE is one thing in which I wish especially to interest the women of our land—for they are able to influence the men.

It is the question of preserving botanical localities. If any farmer had upon his place a great natural curiosity, such as Niagara Falls or the mammoth Cave, no one would need to say a word to him as to whether he ought to keep it intact or not. But if he owned the habitat of a rare, native plant—what then?

Looking over Bartram's Flora, of Philadelphia, one finds mentioned genera belonging to the vicinity, which are no longer found in it; why? This is due to many causes, no doubt, but largely perhaps, to ignorance and carelessness.

Every one knows how rare is our choice, natural plant, the trailing arbutus. What, short of actual wantonness could ever allow it to degenerate and die out? What right have mere curiosity hunters to defraud succeeding generations, by tearing out the precious roots? And the same way with

FIG. 168—BORDER FOR EMBROIDERY.

ferns. Who could wilfully do such a thing as pull up the sources of their fairy, feathery life, merely to fill vases and decorate walls?

Whoever does this is a vandal.

Fortunately, our magnificent park will save for posterity many rich floral treasures. We have, on the rocks of Laurel Hill, a fern which is not known to occur anywhere else east of Kentucky, except perhaps in the Alleghanies. Nothing can disturb it. In the neighborhood is another rare fern, scarce occuring elsewhere, except in Siberia. It is to be hoped that will be let alone.

Then we have the choice orchids—Showy Orchis and Adam and Eve—as well as the Dielytra, Corydalis and some other flowers, beyond the reach—devoutly let it be wished—of destroyers.

It is not too much to say that for our country's honor, we women ought to exert our best influence to keep our national flora from becoming extinct.

NOTES OF WOMEN.

MRS. SCOTT SIDDONS was reading to a fashionable audience at Columbia, S. C. In the midst of a selection from "King John," at the point where the Prince is sentenced to be blinded, she stopped abruptly, said it was impossible to proceed, and walked off the stage. The people thought she was overcome by emotion, aroused by the passage which she was reading, and so they applauded her for the supposed display of womanly feeling. But they were mistaken. A party of young men in a box had annoyed her by conversation and inattention, and she returned to explain that unless they behaved better she would read no more They were quiet thereafter.

THE CROWN OF ENGLAND'S QUEEN.—The Imperial State crown of her Majesty Queen Victoria was made in 1838, of jewels taken from old crowns, together with many supplied at her command. The cap is of crimson velvet, bordered with ermine fur, and the gems are diamonds, sapphires, rubies,

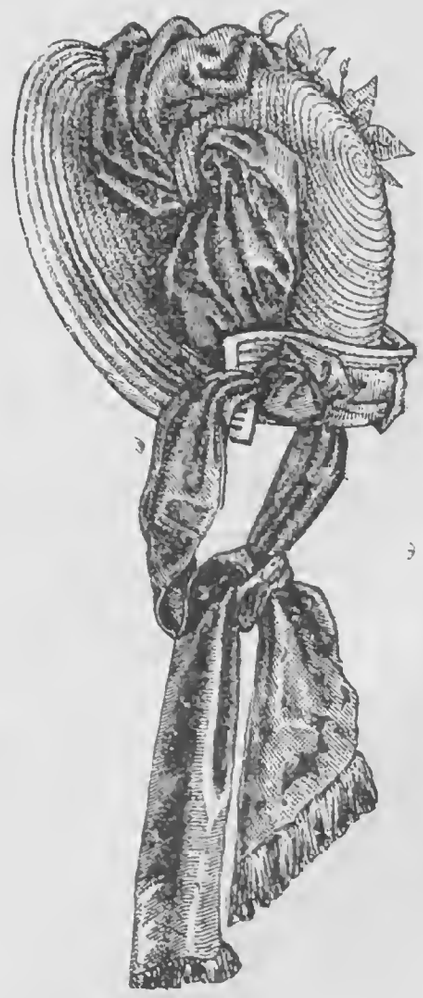

FIG. 169.

pearls and emerald. The whole crown weighs nearly forty ounces. There are eight sapphires in the first band of jewels.

MRS. G. W. QUIMBY, of Augusta, Maine, who has for several years served so efficiently as member of the Visiting Committee, has been appointed trustee, in response to a general request, amount-

ing almost to a demand, of the State lunatic asylum, and in accordance with a bill passed by the legislature, providing that one of the six trustees of the insane hospital shall be a woman.

MISS NETTIE E. WAUGH, of Peoria, Ill., in a paper she has written for the Educational Weekly, on Primary Education, says, "that love and affection in school are what sunshine and shower are to vegetation."

CORRESPONDENTS' CORNER.

DEAR MISS CLARK:—Please send us a pattern for the center of a Java canvas tidy, through the RURAL. I have a very nice border taken from the "RURAL" and would be grateful for a center. I am much interested in the "Woman's Department" and think it a very valuable part of the paper to the farmers' wives. MRS. H. W. R.

Beaver Co., Pa.

ANS.—The pattern asked for will appear in issue of May 22. R. C.

Literary Miscellany.

POOR LITTLE JOE.

PROP yer eyes wide open, Joey,
For I've brought you sumpin' great.
Apples? No, a long sight better!
Don't ye take no int'rest? Wait!
Flowers, Joe—I knowed you'd like em—
Ain't them scrumptious? Ain't them high?
Tears, my boy? What's them fur, Joey?
There—poor little Joe! don't cry!

I was skippin' past a winder,
Where a bang-up lady sot,
All amongst a lot of bushes—
Each one climbin' from a pot:
Every bush had flowers on it—
Pretty? Mebbe not! Oh no!
Wish you could have seen 'em growin';
It was such a stunnin' show.

Well, I thought of you, poor feller,
Lyin' here so sick an' weak;
Never knowin' any comfort,
An' I puts on a lot o' cheek.
"Missus," says I, "If you please, mum,
Could I ax you for a rose?
For my little brother, missus,
Never seed one, I suppose."

Then I told her all about you—
How I bringed you up—poor Joe,
(Lackin' women folks to do it).
Such an imp you was, you know—
Till yer got that awful tumble,
Jist as I had broke yer in
(Hard work, too) to earn yer livin'
Blackin' boots for honest tin.

How that tumble crippled of you,
So's you couldn't hyper much—
Joe, it hurted when I seen you
Fur the first time with yer crutch.
"But," I says, "he's laid up now, mum,
'Pears to weaken every day;"
Joe, she up an' went to cuttin',
That's the how o' this bokay.

Say! It seems to me, ole feller,
You is quite yerself to-night;
Kind o' chirk, it's been a fortnit
Sence yer eyes has been so bright.
Better? Well I'm glad to hear it!
Yes, they're mighty pretty, Joe;
Smellin' of 'em's made you happy?
Well, I thought it would, you know.

Never seen the country, did you?
Flowers growin' everywhere!
Sometime when you'r better, Joey,
Mebbe I kin take you there.
Flowers in heaven! 'M—I 's'pose so;
Don't know much about it, though;
Ain 't as fly as w'ot I might be
On them topics, little Joe.

But I've heerd it hinted somewher's
That in heaven's golden gates
Things i s everlasting cheerful—
B'lieve that's what the Bible states.
Likewise, there folks don't get hungry;
So good people, when they dies,
Finds themselves well fixed forever—
Joe, my boy, wot ails yer eyes?

Thought they looked a little sing'ler,
Oh, no? Don't you have no fear;
Heaven was made fur such as you is!
Joe, wot makes you look so queer?
Here, wake up! Oh, don't look that way.
Joe, my boy! Hold up your head!
Here's your flowers, you dropped 'em, Joey!
Oh, my God, can Joe be dead?

JOHN ASCOTT'S DAUGHTER.

BY CHARLES RICHARDS DODGE,
Author of "Louise and I."

(Continued from page 285.)

CHAPTER V.

HOW IT WAS DONE.

TWENTY-FOUR hours afterwards George Ashton found himself upon a railway train, on his way to N——. He sincerely regretted that he had actually quarrelled with his father, not so much that it had compelled him to leave the paternal roof, as that a separation had been brought about under such unpleasant circumstances. But then, he reasoned, it would have come, sooner or later, for he would not, could not renounce the woman he loved, and his father's prejudices were never overcome. Arriving at his destination he hastened to the home of Mr. De Fondville, presenting himself before May, unexpectedly and almost unannounced.

"Well, May," he commenced, after the usual greetings, "you have a nice sort of a man for a lover."

"Why how you frighten me George. What has happened?"

"I am an outcast, and worse than that, two thousand dollars in debt," he answered throwing himself down upon a sofa near.

"An outcast! What do you mean?"

"I've no shelter over my head, nor means to procure one, as father has shut his door against me, and all my money is in that piece of ground."

"If you mean you have bought the farm," she said, seating herself beside him upon the sofa, "you certainly have a shelter over your head, if there is a house on it, else what will you do with me, when—when we go there to live; but what do you mean by your father shutting the door upon you?"

He has quarrelled with me, because I refuse to follow his dictates, not only in the matter of a pursuit in life, but in the selection of a wife also."

"Oh, George," she said, drawing near him, "he does not like me."

"Rather say he is infatuated with a little good-natured, namby-pamby forty-second cousin of mine, for whose society I have never cared two pins."

"Is that really *all?*" she asked, earnestly.

"And that I won't go into business—"

"Does he know—?"

"Yes, I told him last night I should be married soon, should marry you, and it was the idea of losing Jennie for a daughter-in-law that so enraged him. Never mind, I have bought the farm with aunt's money as far as it would go, and given Mr. Stone a mortgage for the unpaid balance of two thousand dollars."

"That is a large amount of money to owe when one is just making a start in life. Aren't you frightened, George?"

"No, darling, I have done it all for you, and I think you will help me pay off the debt by your sensible advice and good counsel."

"I am going to do all I can, of course, but I am afraid I shall not help you much."

"We shall see about that," he answered, pressing her hand fondly.

"You have not yet told me where the farm is located. Is it far from dear old Maplewood?"

"Not very far. There will be considerable to do to the place in the way of repairs, for tenants are not owners.

"And every cent of the money is spent," she mused half audibly.

"Oh no, we are not so badly off as that. I have reserved a thousand dollars for working capital, but I am afraid it will not go far, there will be much to buy."

"Don't buy too much then at the start."

"That is good advice May, surely."

"Is the house furnished?"

"Furnished——!"

"Yes, *furnished.*"

"Bless my soul! I never thought of that. I don't believe there is a chair on the place," and George looked at his companion with a very curious expression upon his countenance.

"And you are to take me there in less than a month?" As she said this she laid her hand lovingly upon his shoulder, looking with her great brown eyes full into his own.

"What a stupid fellow," he exclaimed. "I never thought of furniture at all. We must have some—mustn't we?"

"I rather think we *must*, ha, ha, ha, it is too funny!"

"Well, it may appear very funny to you, but I fail to see the humor of it."

"And what are we to live upon, pray?" she went on to ask.

"On the farm—we can grow all we can eat, of course, so the living is arranged—"

"*Of course,*" she replied, mimicking his tone of voice, we can grow broad-cloth coats, and kid gloves, and——"

"Hang the kid gloves, May, I'm going to work now in earnest. I've clothes enough for the present—if—if you have," he added, looking up hastily.

"Ha, ha, ha, you do make me laugh in spite of myself," said the little lady merrily, "though, as you say, its no laughing matter."

"No it isn't, especially in regard to that furniture. I'll have to manage it somehow." He arose from his seat, took a turn up and down the room, and again confronting the girl added, "Its expensive stuff isn't it?" I never bought any in my life."

"Nor I, but I think I can show you a way out of the difficulty, if you will let me."

"I am all ears," he replied, "although there is really nothing mulish in my disposition."

"I have saved a little money since making it my home here, and have a few hundred dollars more than I shall need for the present; we can use that. Do you think it will be enough?"

"Why May, we couldn't use your money in that way. No, no, girl, hold on to what you have, by all means."

"Wouldn't it be mine all the same if I bought the furniture?" she asked. "I think the house will be my domain any way, for I can't help you out of doors."

"I don't know; but I would rather enjoy feeling that I owned everything, and you into the bargain."

"Indeed! Well, now, I regard it that 'what's your's is mine, and what's mine is my own,' but really, to be sensible, rather than sentimental, you haven't the money to buy the furniture, and I have; we must have some, and there isn't any; now what is the most reasonable thing to do under the circumstances?"

"Use your money, I suppose," he answered.

"Then we will select it next week, and after getting what we need, and putting by something for contingencies, if there is anything left we will spend it in books."

"We can't afford books, May."

"Yes, a few books will be necessary, for we shall both be very inexperienced and do a great many foolish things that will take money we might have saved, so I think it is a good rule to follow to endeavor to learn what others have done before us, and try to begin where they left off."

"Good argument—but you needn't be afraid of my farming as my grandfather did,—he was a farmer—just because he was my grandfather. You are a queer little woman, I declare, won't you take the farm for the first year, and employ me at so much a day and board?"

"You wouldn't do as I said."

"Oh yes, I would," he answered, playfully.

"Then you would be the first man that ever put implicit confidence in a woman's *say so*, you men know it all, and you *are* knowing enough to say nothing about your mistakes. But you have still to tell me where the farm is located. I believe I asked you before if it is near my old home. Is it in sight of Maplewood?"

"I think you might be able to see Maplewood *from the top of the house*," he answered, looking away in an opposite direction.

How many pleasant hours they passed during the week that followed, talking over their immediate future, and making arrangements for that great event which every young man thinks, in his own particular case, is the most wonderful thing that ever happened.

George Ashton was a smart enough young fellow—well-informed, and possessed of excellent judgment in most things—but one of his worst faults was a disposition to take things for granted, neglecting to look far below the surface, or to weigh carefully all the pros and cons. May had seen this trait in him and she felt it would operate seriously against his full success as a farmer, unless he should work hard to overcome it. The furniture matter was a fair example of his manner of treating a subject. He had been over the farm, estimated the repairs that would be needed, figured carefully upon tools and implements, and made fair allowances for stock even to the minutest particular. All this arrayed, he took for granted there was nothing further to be done, but to go to work when the time came, and trusted that all would go on swimmingly from the start. Not so with the woman he had chosen for his wife. She had been reared in a hard school—the school of bitter experience, having to depend upon herself from early girlhood. She was just the kind of a woman George needed for a wife, and it was truly a turning point in his career when she gave him her promise. But for one thing she would have been perfectly happy in the anticipation of coming events, and that was George's quarrel with his father. She could hardly think a man so hard and unreasonable, and yet it must be so in this case or he would never have shut the door against his boy upon so slight a provocation. Could it be that George had deceived her? Perhaps Mr. Ashton was displeased with *her*, though she had never seen him in her life. The doubt gave her pain, but she could not bear to hurt the feelings of her lover by expressing it, so she kept it to herself and only resolved to get at the truth by a woman's tact if possible.

CHAPTER VI.

"FOR BETTER, FOR WORSE."

CAN the reader call to mind a perfect spring day, when the air is soft and balmy and the atmosphere is teeming with new life, when all nature seems filled with an entrancing witchery and every blade of grass and swelling bud whispers a hope? I have seen such days and their skies are bluest blue and great white banks of sheeny clouds float lazily across them. Their forests are painted in softest grays, and happy birds are twittering their tales of love in every tree.

A sweeter spring-day could not have come to gladden earth than that upon which George Ashton took his bride to Maplewood, and a sweeter bride than May Ascott, George had never seen. It was a very quiet wedding, though the De Fondville's did all in their power to make the occasion a joyful one. Mr. De Fondville gave away the bride, and Blanche, a fair haired girl some four years younger than her friend, the little governess, acted as bridesmaid. No relatives were present, as there were none May could call near of kin and George's family choose to stay away. They were all invited even to Elbridge Ashton, Esq., but he took no notice of the affair whatever. The brothers politely sent regrets, though George hardly expected so great a show of civility, for he knew policy inclined them to the opinion of his father.

It was a very pleasant little wedding, so Mrs. De Fondville said, and to that kindly woman a large share of the credit was due. She had grown to love the orphan girl, and to regard her almost as one of her own family, and now that she was really going out from their pleasant home and fireside, she felt a true motherly sorrow at the parting. It was the pleasantest home May had known since her father's death, and when the farewells and God-speeds had been spoken, and the carriage rolled down the broad avenue leading to the highway, she felt that she was indeed leaving home."

A bridal trip other than to the new home had not been deemed expedient, George remarking grimly that affairs on the farm needed their immediate attention, while May archly suggested that perhaps they could'nt afford it. So they were going directly to Maplewood, at least that was George's destination, and his wife was going to "the farm" wherever that might be, for she was yet in ignorance of the surprise that awaited her. When the furniture was purchased she had expressed a desire to visit the farm and see that everything was in proper place, but George had dissuaded her, saying that old Mrs. Briggs, a former housekeeper of his father's, had been engaged to put things in order and would have the house in readiness to receive them.

How closely the young wife watched the stations as they neared the town of S——, and when at last their destination was reached, with what feelings of mingled joy and sadness did she again behold familiar scenes fraught with tender memories of other days. And when the dusty town lay behind them and their carriage sped along the dear old road to the home of her childhood how her pulse thrilled with delight.

"Oh, George," she exclaimed, "it seems like a dream. Do we pass Maplewood on our way to the farm?"

"You will see it, darling," was his reply; "but it has changed somewhat since the long ago when we roamed over its hills and meadows, a pair of careless, happy children."

"We are coming near it," she exclaimed, joyfully, "if I remember rightly, this is the farm Steve Hascall, as father used to call him. Who owns Maplewood, George?"

"Yes, this is the Hascall place, but 'Old Steve sold out and went West with his son years ago. The present occupant has been married but a little while, and there is a very romantic story connected with the first meeting with his wife." Of course, George told the whole story, spinning it out to its utmost length. "This is Maplewood," said he at last, as the avenue of trees leading up to the house came in view. "Shall we drive in, May, just for the fun of the thing, the present owner is a friend of mine?"

May said nothing, but she held her husband's hand tightly as they rode up the old familiar drive-way, more shut in than ever by the trees, and as the house came in view, the mists gathered in her eyes,

The carriage rolled to the doorway, and as it stopped in front of the great open porch, at George's command, Mrs. Briggs appeared, dressed in her Sunday best, and addressing "Mr. Ashton," welcomed them most hospitably.

"Let us go into the house, May, I think Mrs. *Smith* will be glad to see us," and he put up his hands to assist her to alight.

"I do not quite understand this," she whispered "is it proper for us to make a call here at this time?"

"Come," said he, taking hold of her hand, and in another moment they were on the broad door stone.

"Walk into the parlor," said Mrs Briggs kindly, "I will come to you, Mrs. Ashton, shortly," and she threw wide open the doorway and vanished in another direction."

May had followed her husband into the pretty room as one walking in a dream, but as her eyes fell upon the familiar carpet and the furniture they had purchased together only a week before, she comprehended it all at once, and throwing her arms around her husband's neck, gave expression to her intense feelings in a flood of tears.

An hour later, as they all sat down to a delicious tea prepared by the kindly old lady, Mrs. Ashton was installed mistress of Maplewood, and entered upon the duties of her office with grace and dignity.—To be continued.

MAGAZINES FOR MAY.

ST. NICHOLAS FOR MAY opens with an important "Talk with Girls and their Mothers," by Washington Gladden, and contains the first installment of Noah Brook's new serial for boys—a base-ball story entitled "The Fairport Nine," and finely illustrated by Redwood.

Of complete short stories there are five, all with pictures: "Topsyturvy's Dream," a fanciful tale by Edgar Fawcett: "The Boy and the Giant," a Bible story retold by Susan Coolidge; "Sally's Soldier," a Decoration-day story, with pictures by Zogbaum; "Two More of the Major's Big-talk Stories," being a sort of modern Munchausen adventures in the desert of Sahara, with comical and spirited illustrations; and "A Term at the District School," from a girl-scholar's point of view.

There are two Natural History articles: "The Story of Lizbeth and the 'Baby,'" an account of horned lizards, with pictures from life by F. S. Church; and "Curious Facts Concerning Ants," with five illustrations.

Louisa M. Alcott's serial, "Jack and Jill," describes how Frank and Gus ran away with a locomotive engine, and what fun the boys and girls had on Washington's Birthday, with *tableaux vivants*, music, and a feast.

"Oriental Jugglery," an illustrated paper, tells of some wonderful tricks and feats by Hindoo jugglers. "A. D. 1695" explains, with the aid of pictures, an interesting piece of history. "How to Care for the Sick" is a practical article, giving young folks clear and safe advice concerning nursing, how to act and what to do in a sick room.

There are, besides, an out-door poem by Lucy Larcom; a humorous piece on "Ancient History," by Margaret Vandegrift, with illustrations by E. B. Bensell; some funny pictures by L. Hopkins: and two drawings by Addie Ledyard.

The Departments provide stories and pictures for the very little folk, and pictures, items, letters and puzzles for everybody.

ECLECTIC MAGAZINE.—This excellent periodical is at hand, and contains, besides its literary attractions, a fine steel engraved portrait of the venerable Dr. Leonard Bacon. The literary contents are varied and interesting, comprising the following articles: "Copyright," by Mathew Arnold; "The Northeast Passage: Narrative of Lieut. Palander, Swedish Royal Navy, Commander of the Exploring Vessel;" "An Eye-Witness of John Kemble and Edmund Kean," by Theodore Martin; "Yoshida-Torajiro," a bit of Japanese Biography; "Radient Matter," by D. Pidgeon; "The Bells of Lynn," a poem; "Henri Regnault;" "White Wings: A Yachting Romance," by William Black; "Greek and Christian Views of Beauty," by Rev. R. St. John Trywitt; "Chippers of Flint;" "Fate, or God?" by Paul H. Hayne; "Mademoiselle de Mersac," a story; "On the Art of Sketching from Nature in Water-Colors," by Walter Severn; "Chinese Proverbs;" "An Old Boat," a poem; a biographical sketch of Dr. Leonard Bacon (to accompany the portrait); and copious Editorial Departments on "Literary Notices," "Foreign Literary Notes," "Science and Art," and "Varieties."

BEWARE of idleness, the listless idleness that lounges and reads without the severity of study, the active idleness for ever busy about matters neither very difficult nor very valuable.

An Indian at San Diego, Cal., was told that a voice through the telephone was that of the Great Spirit, and when it said, "Give up those stolen horses," he immediately confessed that he was a thief.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

CHURNING EXPERIENCE IN "EVERY-DAY HOUSE."

ANNIE L. JACK.

AN article in the RURAL of April 23, has forcibly reminded me of some of the experiences of my own life, and I have jotted them down to add to the replies that will doubtless be sent in on the subject. When I first came to "Every-day House" and went through the duty of inspection of the premises, I was very curious to understand the use of a large wheel that filled up a corner in one of the cellars. These apartments are light and airy, and the one I mention adjoined the milk room, where was kept with scrupulous neatness by the housekeeper the milk of ten cows. "Oh! ma'am," she said, in answer to my question, as to the use of this circular piece of furniture, "that is the dog-power," and I then learned that the process of churning was accomplished by the handsome collie dog, with which I was just making friends. But I found out soon that Collie was not so tractable as he seemed; that he had an intuitive knowledge when churning day came, even if the regular day was changed, and took opportunity to go visiting on those particular mornings, leaving the Canadian "help" to do the work of butter making. The churn was a heavy square box, and I thought it too hard work for the girl alone to attend to, as was often the case in busy seasons. So we began to purchase anew—and of that trying time our attic can well testify.

Several Canadian patents were tried and failed—one in particular excites my indignation even now when I see it among the other cast-by tools in the garret. It was a box—not very deep but square—with wheels inside and a crank handle. I have forgotten the patentee, but have often wished he had to turn it for every purchaser *till* the butter came. I am sure he would confess the punishment greater than he could bear. The work of turning the crank was not hard; but the *time* it took before there was any sign of butter, would have tried Job worse than any of his troubles. Never shall I forget one summer night of that trying season, walking up the green lane with a friend, discoursing of many things, and enjoying the moonlight and flower-perfumed air—there came to our ears as we neared the house, a shrill peculiar note. *I* knew it too well; for with every turn of the handle of that churn, one cog wheel touched another and gave out a peculiar and hideous shriek. But my friend stopped and listened, "What a strange noise! a bird in distress evidently" was the observation, and I was thankful that the zealous churner, seeing our approach, had stopped the dismal noise, for it was the girl who, after churning the greater part of the day, had brought out the churn to the night air, and with laudable ambition was determined to *make* it *come* before bed-time. But that was the last time I could be induced to try it, and, almost in desperation, I wrote to the agent in our city to send me a Blanchard churn then highly recommended in the leading agricultural journals. I have no interest in the sale of these articles; know nothing of them or their maker except the comfort I have felt from the use of mine; but peace has reigned triumphant since its arrival, six years ago. It makes as good butter as any I have tried, and we have never failed, winter or summer, to have it *come* in good season, with ordinary care. The children find it no task to churn, so easy is its motion, and I have no motive in recommending it; but a true sympathy with suffering butter makers.

THE CAN QUESTION AGAIN!

WHEN the can discussion was first opened by Mrs. Wager-Fisher, I resolved, though much interested in the subject, to keep quiet; but the more I read about it the greater becomes my concern and (slight) indignation, and as there is a long time before tomatoes are ripe, I feel impelled to advance to the rescue of glass jars (Mason's Improved in particular), rubbers and metal rings.

I have used glass jars—and *only* glass jars—such as the Dexter, Hero, Gem, and Mason's, for years and years, and have never had the rings or rubbers stretch enough to cause me the least trouble, but I cannot explain the reason, as I take no particular care of them, only when I wash and put them away, I place the rubber inside and loosely screw the cover on.

This is done to keep the cans ventilated and free from scent. I have no fault to find with *any* of these cans—although the Mason, with the porcelain-lined top, is my especial favorite—unless it is because they will not stand as rough usage as cast-iron; and I cannot understand why so much fault is found by some with the Mason, as I consider it an excellent keeper and *easy* to seal and unseal.

Most cans will sometimes trouble one a little about opening (it depends greatly on the contents; maple syrup is often very hard), but by pouring warm—not hot—water on the top of the can and renewing it or leaving it on a few minutes, I do not find it necessary for hands stronger than my own to unscrew it.

I think Mrs. Wager-Fisher's failure to keep her tomatoes was owing to their being in too warm, or not *cold* enough a place. I keep tomatoes and all canned fruit and jellies in a dark, dry cupboard in a very cold, but not freezing, cellar, and consider it essential that canned fruit, to keep well, should be put away from light and heat. I think it possible, but not probable, that they fermented from being stale, over-ripe or not hot enough when canned, but if fruit is kept in a cold place and is good a month after canning, I consider it almost certain to keep a year or more. I am very much prejudiced against using tin cans for fruit that is at all acid, as the action of the acid on the tin must render it more or less unhealthful, but if Mrs. Fisher will use any of the above cans and be careful to have her tomatoes scalding hot (I like them best baked) when canned, keep the cans reversed a couple of hours and then put them in a cold place, I am sure the contents will keep as long as she wishes. Hoping she will have the best of success this season, I remain a true friend of all busy housekeepers. S. JENNY PATTEN.

DIPPING CANDLES.

I have dipped candles for many years, and think my method is easier than that published in the RURAL of Sept. 13th. I wind the wicks around a baking-tin, the shortest way. Then cut, open and twist them around a straight stick, six on each stick, as that is about the number for my kettle, which is a tall three-gallon iron one. I allow ten such wicks to each pound of tallow. Place two chairs, with wide fronts to support the poles (old rake handles will answer); lay down some boards between chairs, covered with waste papers to catch the drippings. It is best to prepare the wicks the day previous. Heat the tallow hot in the kettle, set it into a large pan that will not leak, so that if any should run over, the pan will catch it. Keep hot water on the stove near you all the time, as you will need it to fill up the kettle, after the candles begin to grow. Place your chair convenient to your kettle and make it your business to stay there till the candles are large enough, which will take from 28 to 30 times dipping. The first time the wicks are dipped they must be straightened by stripping them down with the fingers, and place them an inch apart on the rods. After that two sticks may be dipped at a time. Keep the kettle as full as can be and not run over, by adding hot water. Dripping candles is work that cannot be put aside till it is finished after it is once commenced. If the tallow-and-water gets too cold in the dipping kettle, it may be reheated, and if the tallow is short, the ends of the candles may be cut off and melted, and put in the dipping kettle. I usually do this, so as to use up the tallow as closely as possible.

The Boiling of Woolen Cloth.

Wool or woolen cloth ought never to be boiled as some recommend in coloring it. It may be heated, but should never be brought to the boiling point, as that makes it tender, as I found to my sorrow a number of years ago, when coloring woolen stockings. They soon looked as though the moths or mice had been at work at them. AUNT EDITH.

CANNING TOMATOES.

RECENTLY the subject of tomatoes has been discussed, and I believe there is one item which has not been mentioned, viz: that tomatoes should be thoroughly cooked before canning; if, on using, you find them too thick, add a little water. This has been my practice for years, and I have had good success. I think the kind of can matters little, providing it is air-tight. Here is my mode of preparing them for the table:—put them in a sauce-pan—any kind you like, as you can have them prepared for the table in one-half hour. To one quart of tomatoes add a lump of butter the size of a walnut, half a teaspoonful of salt, a little pepper and one heaping tablespoonful of sugar; if granulated, two, as it rolls off the spoon; and break in small pieces of stale bread, while they are cooking; you can use crackers but I like bread best. Do not put in too much, or make it too fine. People have frequently asked me how my tomatoes were prepared—they were so nice. It is amusing to hear people talk about buying them at nine cents a quart, as we are obliged to pay eighteen or twenty cents. A friend recently gave me a recipe for making a nice starch polish, which I will also give the RURAL ladies, as I think it excellent.

Chinese Starch Polish.

Spermaceti four ounces; white wax, two ounces; stearine, or paraffine, one-half ounce; ultra-marine blue, one-half grain. Melt together and let cool: use a piece the size of a hickory-nut, for one-half dozen shirts; put in the starch while cooking, also add one teaspoonful of kerosene. The clothing should be dried first, and then dip bosoms and wristbands, cuffs, etc. in while it is as hot as you can bear your hands in it, and rub it thoroughly into the cloth; dry the articles. Then make a thin, cold starch; dip them in and roll them up about two hours before you wish to iron them. To do it well, you should have a polishing iron, which costs 40 cents here. First iron the bosom the usual way; then take a clean cloth; dip it in warm water, and slightly moisten the bosom; take the hot polishing iron and rub it quickly back and forth over the goods, not making long strokes. I think this an excellent thing where people live in the country and do not have the benefit of a skilled laundress. Several years ago one lived near me, and I occasionally would go in and watch her work, and she kindly instructed me in the art of ironing starched clothes, and I have since found it a great benefit to me, for when I must change help, as we all must sometimes, and the new girl does not know how to starch clothes well, I can instruct her myself, and I rarely have to show her twice.

"CONSULTRIX."

"Which is the Best Churn?"

I think I can help Elinor Brooks out of her dilemma. If she will try the "Acme," or "Revolving Barrel Churn," she cannot fail to be perfectly satisfied with her choice, as we are with ours, having purchased one of that kind last fall. Ours is one of the smallest size made, holding 16 gallons, capable of churning the cream of from one to eight cows. It is simple, easy to clean, having no inside fixtures and no cream adheres to the sides, that is not churned. The butter comes, with us, in 10 or 15 minutes, several times coming in five minutes. When the cream is thick and cold, as it is in winter, I warm a pan of milk and put it in the churn with the cream.

MRS. L. J. CARPENTER.

DOMESTIC RECIPES.

Strawberry Pudding.

Cream, a cup of sugar and a tablespoonful of butter: add the beaten yelks of five eggs and two cups of *fine* bread-crumbs soaked in a quart of sweet milk. Flavor with lemon or vanilla. Pour into a deep pudding-dish and bake until the custard is "set." Roll a pint of nice strawberries in powdered sugar, spread over the pudding and cover with a meringue made of the beaten whites and three tablespoonsful of powdered sugar. Return to the oven until the top is delicately browned.

Chicken Pudding.

Cut up a tender fowl into small pieces and boil slowly one-half hour. Season with pepper and salt. Put the pieces into a dish to cool, and set the liquor aside for gravy. Make a batter of a quart of milk, three cups of sifted flour, two tablespoonfuls of melted butter, four well-beaten eggs, two teaspoonsful of baking-powder and a little salt. Put a layer of chicken into the bottom of a baking-dish, pour a cupful of batter over it, then another layer of chicken and batter until full. Have batter for the upper crust. Bake in a moderate oven for about an hour. Skim the gravy saved, boil down, thicken, season, add a little chopped parsley and pass with the pudding.

News of the Week.

MISCELLANEOUS.

Monday, May 10, 1880.

The sub-committee, appointed by the Committee on Ways and Means, consisting of Messrs. Wood, Felton, Phelps, Garfield and Kelley, have reported favorably on the bill introduced some time ago by Representative Hurd of Toledo, prohibiting the transportation of merchandise from one point to another in the United States through the Dominion of Canada. The bill also prohibits custom officers from sealing cars to be transported through Canada and imposes a duty of 30 per cent. *ad valorem* upon every car manufactured in Canada that is brought into the United States....In Howard county, Ark., two young ladies aged 18 and 20 years, quarreled a week ago concerning certain gossip in circulation; Linda Stephen was instantly killed by Mary Stokes who stabbled her in the neck....A report of the War Department concerning the survey for a ship canal across the peninsula of Florida, from the Atlantic to the Gulf of Mexico, just submitted to Congress, indicates that the traffic through the canal would not pay satisfactory dividends. ..The baby elephant whose advent into this world we noticed in the RURAL, made his debut a week ago in the circus now exhibiting in Philadelphia. Hebe, the mother, walked slowly round the ring, with her baby trotting along between her fore legs. Hebe seemed anxious to keep the young one close to her, and—occasionally pushed him back when he seemed eager to go ahead. When she came to a halt, the baby ran out, and gazed curiously around at the crowded seats, and raised his trunk in the air. After gazing a few moments, without fear at the strange sight, the baby returned to his favorite positions. The following are the principal collections made by Professor Nordenskjohl and his staff during their recent expedition:—A rich collection of invertebrate animals made in dredging by Dr. Stromberg, the zoologist; a collection of flowering plants, lichens and algæ, made by Messrs. Kjellman and Almqvist; bones of the Rhytina Stelleri, from Behring Island; fossil plants from Japan and Borneo, and a fine collection of various articles in use among the Esquimaux.

A terrific oil fire is reported to have taken place in the neighborhood of Bradford, Pa., on the 6th inst. About 800 oil wells and hundreds of thousands of barrels of oil were burned in a short time. Several fires which originated almost simultaneously a few miles from each other devastated a large tract of the country and destroyed every dollar's worth of property of hundreds of persons. One of the largest fires originated thus: Two men were attempting to explode a nitro-glycerine torpedo in a well owned by the Oakshade Oil Company about three miles northeast of Bradford. A flow of oil threw the torpedo out of the hole against the derrick. Instantly there was a terrific explosion which scattered the building and machinery in a thousand directions. The oil caught fire and shot up a blazing column a hundred feet high, and the fire soon spread to Rew City two miles distant. This village was speedily consumed and the inhabitants, about 600 number, had to run for their lives.

AGRICULTURAL NEWS.

Bushels of seventeen-year locusts were unearthed by Peter Welrich of North Lebanon, Pa., while plowing in an old orchard last week, the sod of which had not been disturbed for many years....After May 3, the elevator charges on grain delivered here by the N. Y. Central Railroad have been one cent per bushel, arise that was hastily announced by the elevator men and caused no little indignation on the produce exchange. Crop reports from all parts of Ala., say they are several weeks behind, and the weather is unfavorable ....Dr. Asa Fitch, the well known entomologist is dead....By late accounts the drought in Western Kansas is extremely severe and the new settlers are throwing up their claims and leaving to avoid starvation. The Kansas City Times says that if rain comes not soon there won't be 1000 people left in Ness, Hodgman, Lane, Trego, Grove, Wallace, Sheridan and Graham counties, which are mostly as yet unorganized on the Western border. The winter wheat was killed by lack of moisture, and folks are sacrificing stock and everything for food....The Corning N. Y. Farmer's Club has formed a sorghum sugar cane association, and $1000 have been lately subscribed to the industry. ..Although Ireland, in places, is starving, she still sends a goodly part of her best food to England. During one week lately she sent 9,764 cattle; 2,148 sheep; 6,511 pigs, besides 651 horses, and the cattle trade is still steadily increasing....The Queen has made a baronet of Mr. Henry Allsopp, of Hindlip, Hall, Worcestershire, the famous Short-horn owner....Lord Skelmersdale, another well-known Short-horn owner, and prominently connected with agriculture, has also been honored with an earldom.. .This was the owner of the late *first*, not eighth, Duchess, spoken of here last week. He personally purchased her here in 1873, at the great sale of Messrs. Wallcott and Campbell, for $30,600. ....In 1879, England had, in Jan., 15 hours of bright sunshine in 31 days; this year she had 42 hours; in Feb., '79, there were only 39 hours; in Feb., '80, 51½; in March, '79, 91 hours; in March, '80, 141—or 234.8 hours of sunshine in the first quarter of this year, against 137.5 in '79, and 141 in '78... The rainfall of the quarter, too, was less than half the soaking downpour of the same period last year.... The Florida oat crop is pronounced a failure on account of rust....The La. sugar crop is said to be the best ever known. About $80,000,000 are invested in the sugar industry in La....The merchants of Manhattan, Kansas, were unable to discover who habitually robbed them, until a detective advised them to search the students' rooms in the State Agricultural College. The result was the recovery of $400 worth of boots, clothing, jewelry and other things, and the confession by seven students that they were the thieves....

The annual meeting of the Mississippi Valley Cotton Planters' Association will be held in Vicksburg, on Tuesday, May 18—J. H. D. Bowmar, Sec.... On the 6th inst. about 25 canal boats arrived at this city from Buffalo—the first arrivals of the season—their cargoes amounting to about 190,000 bushels of grain....The first barrel of Georgia flour was resold on the Produce Exchange here on the 8th for the benefit of the Calvary Episcopal Church of Americus, Ga....The Virginia Angora Company has been chartered in the Old Dominion with a capital of $2,000,000, for the purpose of purchasing 200,000 acres of land in that State and stocking it with Angoras. California stock will be crossed with the Maltese....Darwin has written a new work—on the Circumnutation of Plants.... Thousands of tons of Limburger cheese are produced every season, mostly in the State of New York and Wisconsin, at a cost of less than half that of the imported article. It finds its market and is consumed mostly by our German-American population. It is more profitable to the farmer and maker than any other kind of cheese, because from a given quantity of milk more weight is obtained and better prices are realized....An English writer says that in the four colonies of Queensland, New South Wales, Victoria and South Australia there were, at the end of the year 1878, 6,141,749 head of cattle and 45,288,606 sheep. Taking one-fifth—the usual average—of these cattle as suitable for fattening purposes, we have a million and a quarter, or, making a further allowance for animals falling below the standard, a round million of fat beeves yearly. About three-quarters of these would be required for home consumption, and 50,000 more for the trade in canned meats, leaving for export 200,000 head. At 760 pounds per head, this gives England a possible meat supply of 150,000,000 lbs. yearly from Australia. * * It is stated, too, that under the encouragement of a brisk foreign trade, this production could be greatly increased....Finlay Dun, the late London Times' correspondent in this country on agricultural matters, has issued a prospectus of a Shorthorn and Jersey show and sale, at Agricultural Hall, Islington, London, to be held next June 16 and 17. Among the patrons are the Dukes of Devonshire and Manchester; the Marquis of Huntley; the Earls of Huntington, Morton, Cooper, Egmont, Zetland, Ellesmere, and Beetive; Lords Skelmersdale, Chesham, Fitzhardinge and De Feyne, and about 20 other prominent men, among them many well-known breeders—truly a fashionable lot .... Prof. Wickersheimer, a celebrated taxidermist attached to the Anatomical Museum of Berlin, has just discovered a liquid which, injected into the veins of dead meat, not only preserves it for several weeks from decay, but keeps it perfectly fresh and in possession of its natural flavor. Having treated a slaughtered calf with his new preparation, and subsequently caused it to be exposed for a fortnight to the air and weather changes, hanging in the open front of a butcher's shop, he invited a select party of scientific celebrities to partake of the meat thus tested, providing for them, however, other viands in case the prepared veal should fail to suit their palates. The professor's guests, however, found his *piece de resistance* so toothsome and delicate that they confined their attentions to it exclusively, neglecting all the other solid items in his *menu*.... Maple sugar made from the sap of a tree in Williamstown, Vt., at the roots of which the brine from the farmer's beef and pork barrels had been emptied last autumn, is reported to have been so salty as to be worthless....A refrigerator vessel, the Frigorifique, fitted to transport fresh meat from South America to France, which has been lying some time in the Seine, has been sold at the instance of an English creditor to an English company for 1,111,000 francs, who will use it probably in the Australian meat trade....

Scrofulous swellings, carbuncles and boils, blotches, pimples and eruptions, enlarged glands, internal soreness, torpid liver, and general clogged condition of the system, all yield in due time to nature's sovereign remedy—Dr. Pierce's Golden Medical Discovery. Sold around the world by druggists and chemists. Foreign trade supplied from London branch. World's Dispensary Medical Association, Proprietors, Buffalo, N. Y., R. V. Pierce, M. D., President.

WEST BLUE MOUND, Wis., March 8th, 1879.

Dr. R. V. PIERCE:

Dear Sir—Having suffered many weary months from liver complaint without relief, I was last summer induced to try your Golden Medical Discovery and Pellets. At the time I was scarcely able to walk. Owing to their effect I commenced to improve rapidly and am now as well and strong as ever. I thank you from the depths of my heart for the good they have done me and wish you all success. Yours truly, MRS. S. STAGNER.

Professor Blot, the lecturer on Cookery, says that housekeepers should insist upon obtaining BURNETT'S FLAVORING EXTRACTS, as the strongest and most healthful.

SORE THROAT, COUGH, COLDS and similar troubles, if suffered to progress, result in serious Pulmonary Affections, oftentimes incurable. "*Brown's Bronchial Troches*" reach directly the seat of the disease, and give almost instant relief.

THE truth is that no person pursuing indoor occupations, can expect to escape the consequences. Those great organs, the liver and kidneys, they will become inactive, and they need just such a remedy as Kidney-Wort to enable them to keep in healthy condition.

The Markets.

SPECIALS FROM ALL CENTERS.

Until Saturday, May 8.

Boston—NEW BUTTER—Market lower: Choice northern dairy, 20@22c.; Fair to good northern dairy, 18@20c.; Common and bakers', 16@17c.; Choice western creameries, 26@27c.; Good Western creameries, 22@23c.; Choice western dairy-packed, 20@22c.; Choice western ladle-packed, 18@21c.; Common and bakers', 16@17c. CHEESE—Supply and demand both limited. New whole milk, 14c.; New half skims, 11@12c.; New skims, 8@9c. EGGS—Market dull; Eastern; fresh, 12@12½c. per doz.; Northern, fresh, 11½@12c.; Vermont and N. H., 12@12½c.; Western, fresh, 11@11½c.; Egg oats, 38@42c. VEGETABLES AND DOMESTIC FRUIT—Supply heavy; market dull. Norfolk cabbages sell at $2.50 per bbl; Florida wax beans at $2.50 per crate; Norfolk Peas are very dull at $1@1.75 per ½-bbl crate; asparagus sells at $3@4 per doz; Bermuda onions, $1.75 per crate, and potatoes at $6 per bbl; strawberries, 20@25c. per box. RYE 95c. per bush. BARLEY, No. 2-rowed State, 70@80c; No. 6-rowed Lake Shore, 80@84c.; No. 6-rowed C. W., 90c@$1; Barley, rejected, 55@60c. SEEDS—Canary seeds are easy, and not quotably lower, and the demand is fair. Sicily $2.45; Smyrna $2; Malaga $2.40; Dutch $2.40; Hemp $1.65; German rape $2.50. Grass seeds firm, with the exception of timothy, which is easier and dull, incidental to the season. Timothy $2.85@2.95; Hungarian $1.25; Red Top, sack, $2.85@$3; Kentucky Blue Grass, $1.25; Red Clover, 7½@8¼; White Clover, 25c.; Millet, $1.35; Orchard Grass, $2 LIVE STOCK—Prices of beef cattle per hundred pounds, L. wt.: Extra quality, $5 37½@5.50; First $4.87½@5.25; Second, $4.37½@4.75; Third, $4@$4.25; Poorest grade of coarse oxen, bulls, etc., $3.25@3.87½. Prices of northern and eastern beef cattle ranged from 4c. to 7½c. per lb, dressed weight. PRICES OF SKINS: Calfskins ₱ lb, 12½@13; Wool sheep skins, ₱ skin, $1.50@3. WORKING OXEN—We note sales of 1 pair, girth 7 feet 2 inches, live weight, 3400 lbs, $170; 1 pair, girth 6 feet 6 inches, live weight, 2500 lbs, $90; 1 pair, girth 6 feet 10 inches, live weight, 2800 lbs, $100. MILCH COWS—The supply lighter than of late, and trade dull. We quote sales of 5 choice milch cows at $50 each; 5 do. at $45; 6 at $36 each; 1 at $40; 2 cows and calves at $31 each. Good cows always command a ready sale at fair prices. VEAL CALVES.—The supply has been largely increased. We quote at 4@5c for a good article; which is little change in price SHEEP AND LAMBS—At Brighton western sheep cost from 6 to 8c, ₱ lb, landed at the abattoir. The market for sheep was fully up to the rates of last week. Range on sheared sheep, 3½@5½c; some yearlings at 6@6½c. Lambs 7@8c. SWINE.—Fat hogs, 5¾@5¾c ₱ lb. Store pigs—wholesale, 6@7c ₱ lb; retail, 6½@7½c ₱ lb. Sucking pigs $2 to $4 ₱ head.

Baltimore.—WHEAT advanced towards the end of the week eight to ten cents per bushel. Southern, $1.35@1.37 for Fultz and $1.40 long berry; No. 1 Md. red, at $1.42½ Western advenced 7½c. for cash; 6c. for May, 3½c. for June and 2½c. for July; No. 3 winter red $1.20; No. 2 do., spot, at $1.32½; May, 1.30; June, $1.24; July, $1.14. CORN, white, 52@54c.; yellow, 51@54c.; Western white, 52@52½c., closing at 54c.; mixed, 49@52c.; rejected, 48c. OATS—Md. at 45@48c.; Western, 43@44c. for mixed and 44½@45c. for bright Western. RYE, 90c. for good to prime. BUTTER—Demand prices steady: New York Creamery at 26@27c.; New York State new at 26@27c.; Western new at 23@25c. for choice and 20@22c. for good to prime; Western rolls, 22@24c. for choice and 20@21c. for good to prime, and near-by stock 21@23c. per lb. for good to choice, CHEESE—The receipts of New York State new are fair and the market is moderately steady at 15c. for choice and 14@14½c. for good to prime. Western Factory is quoted 12½@13c. for choice and 11½@12c. for fair to good. EGGS—The supply is less liberal and the market is firmer at 10@11c. per dozen, the latter for strictly choice fresh. WOOL—The market is weak and easier, with very free receipts and a full stock of all kinds offered. We quote good unwashed at 34@36c, tub-washed at 45@50c., pulled at 40@45c., and Merino at 28@30c. per pound.

Chicago.—BUTTER—Dealers are keeping well closed out inview of the near approach of the season for "grass" butter, and the markets at the east are all more or less unsettled for the same reasons. Choice to fancy creamery at 21@23c ₱ lb; fine to fancy dairy nearly equal to creamery, 19@20c. good to choice dairy 17@18c; medium to fair do 15@16; common 13@14c; good to choice roll 15@17c. medium to fair do 12@14c; common 10@11c; grease butter 6@8c. CHEESE. Prices rule firm and strong. Full cream, good to choice, 13@14c ₱ lb; sour stock about 8½@9½c. Part skimmed about 11@11½ for prime; 10½@11c for good and common hard skimmed about 7@9c. ₱ lb. In a small way choice cheddar creams will bring 14½@15c. Hogs common to fair at $4@4.20; good to choice mixed at $4 30@4 40; choice heavy at $4.45@4.50. CATTLE firm common to good shipping at $4@4.30; good to choice at $4.50@4.95; all were sold. Sheep clipped at $4@4.65.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, May 8, 1880.

BEANS AND PEAS.—The bean market is generally steady; of course home sales are moderating with the increasing warm weather, but the export trade has revived and thus lends activity to the market. Green peas, steady $1.80. Southern B. E. peas at $1.90@2 ₱ 2 bu. bag. Marrow beans, prime, $1.10; other, $1.45@1.55; medium, prime, $1.40 other, $1.25@1.35; pea, $1.45@1.55; white kidney, $1.45@1.65; red kidney, prime, $1.45@1.50; other, $1.25@1.40; black, $2.10@2.15. Lima, Cal., $5. Receipts for week, 4,600 bush.; exports, 2,550 pkgs.

BUTTER.—The market is weak and declining; buyers make sparing purchases, now that grass stock can soon be obtained in straight lots. Western butter is not up to its usual spring mark in quality, and in dairy and factory the falling off in prices is the most noticeable. We can merely annex the closing rates. Prices are liable to sudden fluctuation at this season, and shippers must not count upon better or even supported prices, until stock becomes sound and solid enough to invite exportation.

Comparative receipts and exports from June 1.

	Receipts, pkgs.	Exports, firkins
June 1, '79 to May 1, '80	1,372,436	292,201
June 1, '78 to May 1, '79	1,334,178	284,422
June 1, '77 to May 1, '78	1,150,708	173,450
June 1, '76 to May 1, '87	1,160,068	148,988

New Butter—Creamery, best invoices, 24@24½c.; good to prime, 22½@23½c.; fair to good 21@22c.; poor to fair 19@21c.; State, pails and hf. tubs, choice, 21@22c.; good to prime, 20@21c.; fair to good, 19@21c.; poor to fair, 18@19c.; Welsh tubs, good to choice, 20@21c.; fair to good, 19@20c.; poor to fair, 17@19c.; Western imitation creamery, 17@20c.; do. dairy fresh, extra, 20c.; good to prime, 17@20c.; fair to good, 16@17c.; poor to fair, 15@16c.; do. factory, special marks, extra, 18c.; prime, 16c.; fair to good, 14@15c.; poor to fair, 13@14c.; very poor, 9@12c.

Receipts for week, 25,550 pkgs.; exports, 6,200 do.

CHEESE.—The arrivals have been steadily increasing the past week, and as the early supplies include, as usual, a good many undercured lots, there has been a strong effort to sell them, which has given a very irregular and yielding market. The shipments have been 18,250 boxes, and in connection with the home trade there has been sufficient done to prevent material accumulations. The market leaves off weak in anticipation of still larger arrivals the coming week.

COMPARATIVE RECEIPTS AND EXPORTS FROM JUNE 1.

	Rec'ts. pkgs.	Exp'ts. lbs.
June 1, '79, to May 1, '80	2,323,795	105,448,649
June 1, '78, to May 1, '79	3,017,000	135,209,154
June 1, '77, to May 1, '78	2,382,864	107,182,584
June 1, '76, to May 1, '77	1,940,640	84,210,570

Quotations are for

New, 13¾c. for choice full cream; 12¾@13¾c. for good and fine; 11¾@12c. for fair, and 10@11c. for half skimmed. Ohio factory flat at 13¼@13½d. for full cream; 12@13c. for fair and good lots; 10@11c. for half skimmed.

Receipts for week, 26,562 boxes.
Exports, 17,000 do.
Liverpool cable, 71s.
Steam, 35s.

COTTON.—There is a liberal demand for export and prices are quite steady. Speculation is moderately active; latest prices are for May, 11,71@11.72c.; June, 11.75@11.76c.; July, 11.85@11.86c.; August, 11.93@11.94c.; September, 11.5lc.; October, 11.08@11.09c.; November, 10 81@10.82c.; December, 10.81@10.82c.

DRIED FRUITS.—Apples have a better demand and prices ruling firm. Peaches are quiet and unchanged. Small fruits are slow.

Quotations are for N. C. apples, fair to good, at 7¾@8¼c.; choice, at 9@10c.; fancy at 10@10½c.; Virginia at 7@8c.; New York State quarters sliced at 7½@8¼c.; patent evaporated in cases, choice, at 15@15½c.; good and prime at 14@14½c.; evaporated, choice sliced at 13@13½c., and good do. at 12@12½c. Evaporated peeled peaches, good to choice, at 25@28c.; North Carolina peeled, fancy, at 20c.; choice old at 17@18c.; Georgia prime at 16@17c.; fair to good at 14@15c.; common at 10@12c.; unpeeled halves at 7½@8c.; do. quarters at 7@7½c. Pitted cherries at 18½@19c. Blackberries nominal at 11c. Raspberries at 28@30c. Plums at 17@18c.

EGGS.—Receipts for week, 16,150 bbls.; do. last week, 17,200 do. Supplies, though lighter, continue ahead of the demand. Buyers' wants are not large at this season, when trade is so divided among fresh green stuff and cheap spring fish. The weather has turned warm and buying ahead is done with.

Near Points, 12½c.; State and Penn., 11½@12c.; Western and Canadian, fresh, 11½@11¾c.; poor lots, 10@11c.; duck, 13@14c.; goose, 22@24c.

FLOUR—Has been freely offered at easier prices, but closed firm and more active.

Latest prices are at $3.60@4 80 for inferior to very choice superfine State and Western; $4.35@4.75 for poor to good extra State, odd lots and lines; $4.75@5.25 for very good to fancy do.; $4.40@4.75 for inferior to good shipping extra Western, and $4.75@5.25 for good to fancy shipping extra do.; inferior to very good white wheat extras, $4.75@5.50; very good to fancy do. at $5.50@6.75; red and amber winter wheat, inferior to fancy trade and family, at $4.75@6.10; round hoop Ohio, $4.75@5 25; and trade and family brands of do. at $5.35@6.50; St. Louis at $4.75@5.60 for inferior to good extra; $5.60@6.75 for good to fancy; Minnesota clear, inferior to fancy, at $4 75@6.25; Minnesota "straight," inferior to fancy, at $5 15@7.25, and patent very inferior to fancy at $6.10@8.50; unsound stock at from $2 60@5 00; city mill extra at $5.60@6.00 for fair to fancy West Indies; do. for England, $4.75@5.25 for poor to very fancy; do. trade and family extras, $6.25@7.00; do. for South America, $6.00@6.75; No 2 at $2.70@4.00 for poor to very choice.

Receipts for week, flour, 24,000 bbls.; wheat, 258,300 bushels; corn, 530,200; oats, 242,400; rye, ——; malt, 90,269; barley, 9,100; cornmeal, 4,325 bbls.; rice, 1,521 pkgs.

Exports for week, flour, bbls., 59,000; wheat, bush., 742,100; corn, 742,450 oats, 8,550; rye, ——; malt, ——; barley, ——; peas, 18,983; cornmeal, bush., 3,890; rice, pkgs., 1,853.

CORN MEAL.—Sales at $3.10@3.20 for Brandywine and $2,25@3 for yellow Western.

FRESH FRUITS.—Apples are nearly out of market; fair to choice Baldwins, $3.50@5.00; Russets, $3@3.50; Strawberries in fair demand when well ripened, Norfolk is sending some good Wilsons; but many of the steamer crates are green. Norfolk seedling, per quart 20@26; scarlet 15@20c; N. Carolina 20@30c; Chas. 15@25c. Peanuts dull, and a shade off from former rates. Va. hand-picked 5¾@5¾c.; extra prime, 5c.; good to prime, 4¾@4¾c.; shelled, 5¾@6c.; hickory nuts 90c.

FURS AND SKINS—Weak at former figures. Supplies continue to arrive.

GRAIN.—Wheat has shown a fair export demand. Some 700,000 bush. shipped for the week, and prices closed firm; latest sales are of No. 1 white at $1.23½@1.25¾; do. May, at $1.23@1.24¼ do., June at 1.22¾; ungraded white at $1.20@1.22¾; No. 2 red at $1.23¾@1.30; do. May at $1.23¾@1 30; do. June at $1.25@1.26¾; do. July at $ .1-; ungraded red at $1.18@1.23¾; mixed winter at $1.23½, No. 2 umber at $1.27; ungraded amber at $1.25¾. No 2 Chicago and Milwaukee spring in store at $1.24, New York, No. 2 spring, May option at $1.23; No. Northwest spring May at $1.24¼-No. 3 Milwaukee at $1.14; ungraded spring at $1.11. Corn is in larger receipt and offered lower; latest sales are of New York No. 2, regular inspection at 50¼@52c.; do., May, at 48¾c.; do., June, at 47½c.. do., July, at 47¼c.; New York steamer mixed at 51c.; ungraded mixed Western at 50@53c.; No. 3 at 50c; steamer white at 51@51½c.; No. 2 white at 53@53¾.; New York low mixed at 52c.; 4,500 bushels white Southern at 56c. Oats are active and closed firm; latest sales are of of No. 1 white 50c.; No. 2 white at 45¾@47c.; No. 3 white at 44c., New York No. 1 at 45c.; New York No. 2 at 44¾@45c.; do. May at 40c.; do. June at 38¾@39c.; No. 3 at 4 @43¾c.; ungraded white Western at 45@50c.; ungraded mixed Western 42@45c.; white State at 43¾c.; mixed State at 45@45¾c.; No. 2 Chicago at 41c.

HAY AND STRAW.—Offerings are liberal, but demand is good and prices are sustained.

Shipping hay quoted at 70c.; retail lots at 80@85c. for medium, and 85@$1, for better qualities; clover, 55@60. Straw at $1@1.05 for long rye; 65@70c. for short rye, and 50@60c. for oat.

Exports for week, 2,550 bales.

HOPS.—There has been very little stir to trade on export account, but brewers buy sufficiently to use the moderate receipts, prices are unchanged. Quotations are for:

	Cents per ₱
New York, fancy	Nominal.
New York, new crop, good and choice	33 @36
New York, new crop, medium	31 @33
New York, new crop, low to fair	27 @29
Eastern, new crop	27 @35
Wisconsin, new crop	27 @35
Yearlings	7 @18
Olds, all growths	4 @10
Pacific Coast, new	30 @35
Pacific Coast olds (nominal)	5 @10

LEATHER.—Quotations are for hemlock sole, 23@25c.; for light two, 24@27c.; for middle do., 23@26c. for heavy do. and 21@24c. for good damaged.

MAPLE SUGAR—Supplies seem to be remnants of lots, and not being attractive, they sell hard. The stock now offering quoted, 9@12c. for cakes. Syrup in tin, 75c.@$1 gal.

OIL-CAKE.—Western is quiet, quoted at $32 per ton.

POULTRY AND GAME.—The market for dressed is easy; the remnants of frozen helps to give the supply a show of bulk. Poor lots have no outlet and prime near points and fresh killed fully supply all inquiries.

Turkeys, choice, small, 11@12c.; choice, medium, 9@10c.; fair to good, small, 9@10c.; large, 7@9c.; Phila., dry-picked, 12@13c.; capons, Phila. large, 25@26c.; small, 21@24c.; slips, 20@21c.; chickens, winter, large, Phila., 25@27c.; small, 23@24c.; spring, Phila., ₱ lb., 30@35c.; fall, Phila., dry-picked, 20@21c.; yearling, Phila., dry-picked, 16@18c.; fowls, Phila., dry-picked, 14@15c.; N. J., good to prime, 13@14c.; State, good to prime, 12@14c.; poor to fair, 5@10c.; ducks, Phila. dry-picked, 18@20c.; squabs, white, ₱ doz., $2.75@3; dark, $1.50@2.

Large spring chickens in good request and firm; small plenty and low. Fowls have been quite plenty for a day or two and lower, but have met a fair demand; a few choice lots by the single coop have sold ¼c. above quotations. Turkeys very dull and much lower. Ducks and geese steady. Pigeons, if very large and strong, sell well, but small ones are neglected.

Pigeons have ruled low all the week. Demand good as there is little other game in market. English snipe and plover, $2.12@2; sand snipe, 50@60c.; wild pigeons, 65@75c.; squab, 87c.@$1.

PROVISIONS.—Provisions have been dull and easy in price: mess pork quoted at $10.80@10.90 for new in job lots on spot; $10.80 for May and June; $10 85@10.90; July and $10.95@11 for August. Bacon at 6¾ for long clear and 7 for short clear. Beef at for extra India mess quoted at $18@20 for city and $19 for Philadelphia, and at $10@10.50 for extra mess, and $9.50@10 for plain mess. Beef hams at $17. Lard—Western steam at 7.20 for spot lots; 7.17½@7.20 for May; 7.20@7.23½ for June; 7.25@7.27½ for July, and 7.30@7.32½ for August. Stearine at 7½c. for Western.

Receipts for week, pork, 5,000 pkgs.; beef, 1,280 pkgs; cut-meats, 40,457 pkgs.; lard 25,472 pkgs. Exports for do., pork, 6,525 pkgs.; beef, 2,835 pkgs.; cut-meats, 12,129,239 lbs.

SEED.—Clover is moderately active and steady. sales at 6¾@7c. for Western, and 7@8c. for State. Timothy is quiet at $2.60@2.65.

TOBACCO.—The export demand continues small and the home trade moderate. Prices unchanged.

VEGETABLES.—Exports of potatoes for week, 2,200 bbls. For such limited demand as exists sellers of old potatoes obtain full prices for selected lots. It looks as though an important part of the crop has been held too long and an early and decline is looked for. New potatoes in fair demand, but no very good styles are arriving in wholesale lots. Southern green stuff is easy with weather that will soon allow nearer points to compete for a share of trade.

Bermuda, new ₱ bbl., $4.50@5; Chas. & Sav., new $3@4; Fla., new, $3@4; culls, $1.75@2; Early Rose, Maine, per d.-h. bbl., $1.50@1.75; State $1@1.25; in bulk per bbl. $1@1.25; Peachblow, State, white, per d.-h. bbl., $1.50@1.75; red, $1.37@1.50; N. J. per bbl., $1@1.25; Snowflake, ₱ d-h bbl., $1.50@1.75; Peerless, State, $1@1.12; bulk, ₱ bbl. $1; Jersey, bulk, 50@75c.; Sweet potatoes, $2.75@3.00 Tomatoes, Bermuda, ₱ box 50@85c.; cucumbers, Fla., ₱ crate, 75c.@1.25; string beans, Sav. & Ch'n, $2 50@3; squash, Florida, white, 25c.@50; yellow, per bbl., 75c.@$1; green peas, Norfolk, per hf. bbl. crate, $1@1.25; asparagus, C. Bay, per doz. bunches, $2 50@3; Jersey, $1@2.50; Md. and Del., $1@2.50; Norfolk, $1@2; kale, L. I. ₱ bbl., 75c.@$1; spinach, L. I., ₱ bbl. $1@1.75; turnips, Norf., new, ₱ 100 bunches, $1@2; beets, Norf., do., $3@5; do., radishes, Norf., 50c.@$1; squash, marrow, per bbl., $1.75@2; Hubbard, $1.75@2; cauliflower, Ch'n and Sav., $4@7; Norf., $3@4; do. cabbage, $1@2.25; Ch'n and Sav., $1@2.25; rhubarb, L. I. & Jy., ₱ 100 bunches, $1.50@2.50; onions Bermuda, new ₱ crate, $1.50@1.62; turnips, Russia, ₱ bbl., 75c.@$1.25; carrots, $2@2.25.

Hot-house products not much wanted. Cucumbers, selected, per doz. $1@1.50; seconds and culls, ₱ doz., 25@75c.; radishes, per 100 bchs., $2@2.50; lettuce, ₱ bbl., $2.50@3.50; carrots, ₱ 100 bchs., $2.75@3.

WOOL.—The market continues dull and buyers have the advantage. Manufacturers are fairly well supplied and are indifferent pending developments on the new clips. Quotations are for domestic fleeces:

Ohio, Pennsylvania and West Virginia, XXX, 58@60c.; XX, 54@56c.; X, 51@56c.; No. 1, 58@60c.; No. 2, 55@58c.; coarse, 45@48c.; combing, 55@60c.

New York Michigan and Wisconsin, X and XX, 50@54c.; No. 1, 57@60c.; No. 2, 54@57c; coarse, 43@46c.; combing, 54@59c.

Indiana, Kentucky and Tennessee, X and XX, 50@54c.; No. 1, 57@60c.; No. 2, 54@55c.; coarse, 42@45c.; combing, 55@58c.; combing unwashed, 43@47c.

Illinois, Iowa, and Minnesota, X and XX, 47@50c.; No. 1, 55@57c.; No. 2, 50@53c.; coarse, 40@43c.

Georgia, Alabama, Mississippi and Louisiana, fine unwashed, 43@45c.; medium unwashed, 42@44c.; coarse unwashed, 20@37c.; burry, 20@30c.

LIVE STOCK MARKETS

NEW YORK, Saturday, May 1, 1880.

BEEVES.—Receipts for week, 13,755 head; do. last week, 15,915 do. There has been a good, strong market, and the closing tone promises well for next week. Prices run quite uniform. Medium to prime steers, 8½@9¾c., dress 56 lbs.; top grades, 9¾c. Export demand fair.

COWS AND CALVES—Quiet at $25@40 per head for common to fair, and good to prime are only worth $45@55 here.

VEAL CALVES.—Live have ruled low the entire week. In dressed, the regular river shipments of warm weather now quoted.

Live calves, N. J. and Bucks Co., choice, 5½@6c.; prime, 5@5½c.; State, choice, 5c.; do. prime, 4½c.; fair to good, 4@4½c.; poor, 3½c.; Mt. Holly, good to choice, 6@7c.; buttermilk, 3½@4c.; grass, 3c. Hog-dressed, Newburg, choice, 8@8½c.; good to prime, 7@8c.; fair, 6@7c.

SHEEP AND LAMBS.—Receipts for week, 20,350 head; do. last week, 28,967 do. At 60th st. heavy shipping sheep and prime slaughtering wethers sold fairly at about previous prices, but common and light sheep were dull and in buyers' favor. Trade at Jersey City was slow, and nearly all grades of sheep declined ½@¾ ₱ lb. Lambs were scarce, in active and higher. Common to choice clipped sheep sold at 5@6c.; a load of unshorn do. at $6.35; some poor unshorn yearlings at 7½c.; and spring lambs at 9@10c.

SWINE.—Receipts for week, 31,956 head; do. last week, 26,598 do. Receipts all sold: nominally at $4.60@4.80; city dressed 5¾@6c.; pigs 6½c.

JOHNSTON HARVESTER CO.,

Brockport, N. Y.

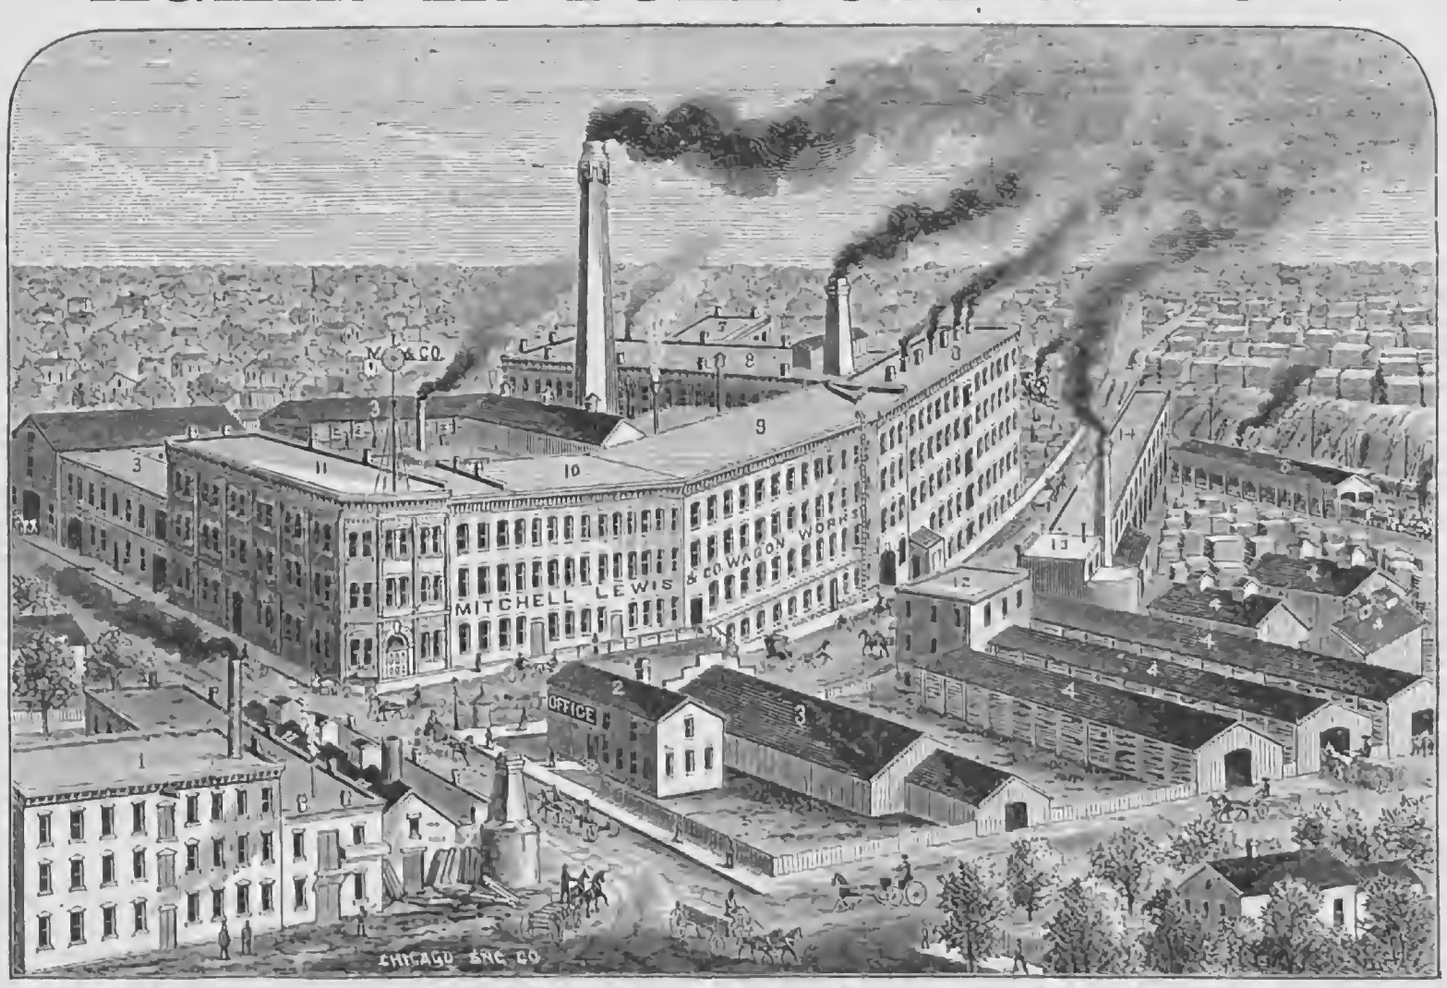
MANUFACTURERS OF HARVESTING MACHINES.

WROUGHT IRON MOWER.

This Machine is a model of lightness and simplicity. It is built largely of Wrought Iron, which insures great strength and avoids all unnecessary clumsiness and weight. It is made in the most substantial manner possible, and, like all the machines made by this company, is warranted to do *First-Class Work*. Look out for cut of Combined Mower and Reaper in next issue, of The Rural New-Yorker, May 22nd.

AGAIN IN FULL OPERATION.

Established 1832. Partially burned Jan. 9, 1880. New Works completed March 8th, 1880.



MITCHELL, LEWIS & CO., Racine, Wis. U. S. A.

Farm and Freight Wagons, Platform three and four spring Wagons,

Open and Top Buggies, Ladies Phaetons, Doctors' Phaetons, Sewing Machine Wagons. The best and most thoroughly seasoned stock. Fifty years' Experience, Competent Workmen, Improved Machinery, Mechanical Principles, combine in the manufacture of the **Mitchell Wagon.**

No. 1, Carriage Department; No. 2, Office; No. 3, Store Rooms for finished parts; No. 4, Drying Sheds; No. 5, Shipping Yard; No. 6, Lumber Yards; No. 7, Iron House; No. 8, Blacksmith Shop in basement, Store and Paint Rooms above; No. 9, Machine Rooms and Wood Shops; No. 10, Paint Shop; No. 11, Repository; No. 12, Rooms for re-packing and boxing Spring Wagons; No. 13, Fire Pump and Steam Supply Furnaces; No. 14, Assorted Stock.

U. S. WIND ENG. & PUMP CO., Batavia, Ill.

IMPROVED CALIFORNIA WIND MILL.

Simple, Strong, Durable, Rosette Wheel and perfectly Self-regulating, avoiding 100 wearing joints. Also, Steven's Pony Feed Grinder and a perfect Rotary Motion attachment, without gearing, the power being communicated by the lift or up stroke of Pump Rod. Can be used for cutting feed, churning, &c. The best, cheapest and most useful power in the market. Full particulars, circulars, &c., sent free. Address the Manufacturers. CLARK & CO., SOMANAUK, ILL.

I. X. L. WIND MILL.

For Simplicity, Durability and Power *this mill has no equal.* It runs equally well in light or heavy winds. Ice and sleet do not effect it Works well under all circumstances; never gets out of order. We warrant all our mills. Circulars and descriptive catalogues sent free on application to the Phelps & Bigelow Wind Mill Co., Kalamazoo, Mich.

CHALLENGE WIND MILLS

Victorious at all fairs. Over 7,000 in actual use in every State and Territory of the U. S. It is a section wheel—has been made by the present Co. for ten years; in all that time not one has blown down without tower breaking—a record no other mill can show. We leave it to the public to determine their merit. Mills sent on 30 days' trial. Best Feed Mills, Corn Sheilers, &c., &c. Catalogue free.

CHALLENGE MILL CO., Batavia, Ill.

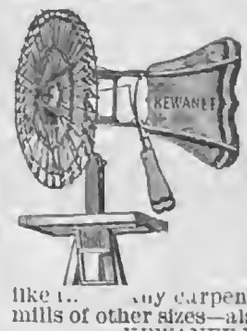
THE

WATERTOWN Wind Mill.

Send for Descriptive Circulars to

H. H. Babcock & Sons,

WATERTOWN, N. Y.

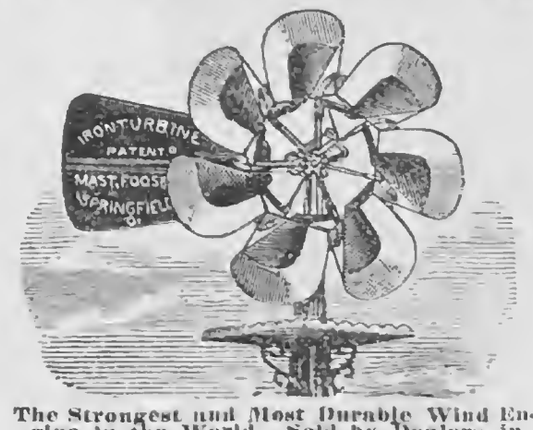


The Kewanee Wind Mill.

Perfectly self-*regulating* and reliable. First premium f American Institute and rom forty-three Agricultural Fairs. Solid wheel, light, but strong and durable, and is incomparably the best and cheapest wind-mill manufactured **Price of ten-foot Mill, $50.** No windmills, of the splendid qualities and finish of ours, were ever offered at any price—like t.. ..ny carpenter can put them up. Windmills of other sizes—also pumps, pipe, tanks, &c.

KEWANEE MF'G. CO., 35 Broadway, N. Y.

NEW IRON TURBINE WIND ENGINE



The Strongest and Most Durable Wind Engine in the World. Sold by Dealers in nearly every County. Inquire for it. Every Wind Engine Fully Warranted.

THE HIGGANUM MANUF'G CORP'N, Higganum, Conn.

Reading for the Young.

BIRD SONGS.

In the old cherry tree by the garden gate
A robin sings sweetly, both early and late;
Her nest is up high in the branches, and there
Four nice little robins are waiting her care.

With a worm in her mouth she flies to the tree,
And oh, how they chirrup, their mother to see.
The worm is divided, and, taking a rest,
She sings them a song by the side of the nest.

God made all the birds and taught them to sing,
And fly through the air with light, rapid wing.
They come ere the forest with green leaves is gay,
And warble their songs all the long summer day.

SOPHIA C. GARRETT.

TALK ON BOTANY—NO. 1.

UNCLE MARK.

LAST summer several articles on botany appeared in these columns for the benefit of the cousins, and particularly for the members of the Horticultural Club, who are supposed to take a lively interest in everything concerning plants. During the winter these articles were not continued, because to study this science to advantage, it should be pursued in the summer, when nature is everywhere giving illustrations of the lessons, and "specimens" for examination can easily be had. Summer is now again at hand, with all its riches of vegetation open for our enjoyment, and, with the permission of the cousins, we will again take up the botany lessons. My little nieces and nephews will find it a highly interesting play to examine the wild flowers and plants that greet them on every hand; to learn their structure and habits; for it is but play to those who interest themselves in the matter. By early giving their attention to this and similar studies, they will acquire habits of observation, and become familiar with numerous facts that may be of untold value in after life. But it is not only the young folks who may profit by a knowledge of botany, the older folks, too, will find it greatly to their advantage. Every farmer should be familiar with the structure of the plants he cultivates, with their mode of fertilization, their habits, etc. And even those who are not farmers and do not, in any way, make a business of the cultivation of plants, will profit by a knowledge of botany. It will furnish material for thought and reflection, and open to the mind a world of enjoyment, from which they are otherwise effectually shut out. It teaches one to "Look through nature up to nature's God."

The natural mode of propagation with most plants is by seed. Of course, everybody knows what seed is. There is not a cousin who, when the word seed is mentioned, does not immediately form an idea in the mind of some small grain to be sown in the ground and from which plants are expected to grow up. In a botanical sense a seed is always the product of a flower. It is a very peculiar organism, and possesses singular powers of very great interest to the students. Thus the smallest seed, but little larger than a particle of dust, contains within its tiny coats the power to germinate and develop into a plant with roots, stems, leaves and flowers, like the plant which produced the seed. The giant Oaks of our forests, which now so majestically spread themselves and tower heavenward, the very symbols of strength, were once small acorns, of which a boy might hold a dozen in his hand; and the acorns that now drop from the lofty tops of these Oaks may, if placed under favorable circumstances, develop into as sturdy trees as their parents. The seed is thus a wonderful concentration of power and possibilities, and in the case of nuts, the future tree is literally contained in a nutshell.

But the seed not only has power to grow into a plant; it has other peculiarities which can be discovered only as the plant develops. Take, for instance, two peas; they may be exactly alike as far as any one can discover. They are precisely of the same form, color and size; you may cut them open and examine the *cotyledons* (seed leaves, or the first pair of leaves that appear when the seed begins to grow) and the *embryo* as closely as you please, and still you can discern no difference between them. They are "as like as two peas," yet when planted one may grow five feet high while the other will only reach two feet in hight, and though planted at the same time, the latter may bear fruit two or three weeks before the former. In short, they are of different varieties. But this could not be discovered in the peas. It is the same way with multitudes of other kinds of seed. Half a dozen Pansy seeds may be alike; they may grow up, and still the plants are alike, but when the flowers appear the markings on these are quite different. What these markings should be, we may assume with tolerable certainty, was already determined in the seed, but the most careful examination would fail to reveal it. (The coloring of flowers, however, is greatly influenced by the kind of soil in which the plant grows, but not in the same degree with all plants.) It is this power of the seed to develop peculiarities and distinctions that exist only in its kind of plants that is especially interesting and puzzling. We know it has this power, but just why or how it is brought about none can tell.

A great deal may be said about the seed, its parts and their relation to each other, but it is not my purpose to describe it here at present. Later on, when we shall have become familiar with the general structure of plants, and how they live and develop, we will again take up this interesting subject. We will now begin with the germination, or beginning of growth, of the seed, and try to follow the plant as it develops till it has run its course, and we shall have studied its many interesting features.

When a perfect seed is placed under favorable conditions for growth, that is, in a place where it can get the necessary amount of moisture and warmth, a startling change at once sets in. The seed-coats begin to absorb moisture; the whole body swells into larger dimensions; it can no longer be contained within its narrow coverings, and finally, like a chick that bursts its shell and struggles to get out, the enlarged embryo bursts the seed-coats and a tiny germ becomes visible. Then we say that the seed is sprouting. It is now no longer a dormant seed, it is a living organism which has wants that must be supplied. These wants are as yet only warmth and moisture. The growing germ needs nourishment, but this it gets from stores within the seed; it is not yet able to absorb nourishment from the ground. Any one of my nieces and nephews can easily follow this interesting process by watching the germination of a pea. In a short time the germ will extend itself in two opposite directions, one part growing upward forming the stem, or *ascending axis*, of the plant, and the other, called the *descending axis*, growing downward, into the ground, and forming the roots.

This disposition of the plants to grow in opposite directions is marked from the start, and continues through its whole life. As soon as germination begins the stem end of the embryo turns upward in search of light and free air, while the root end as persistently avoids the light and buries itself deeper and deeper in the moist and nourishing bosom of mother earth. This fact I accidentally discovered while a boy. I had planted some horse-chestnuts in my garden, and being anxious to have them grow they were often dug up to ascertain how they were progressing. At last I found that several of them had germinated, but the sprouts were all pointing upward. This, I thought was a mistake, as I had the idea that the roots must be formed first; how else could the plant grow? Accordingly I turned them all round so that the germs pointed directly downwards, and I felt proud when I had made this correction, for it would have been a dreadful mistake if the young chestnuts should form their roots in the air, or else have no roots. But how great was my surprise when three days later I again dug up the nuts and found that the sprouts which I had so carefully turned were again pointing upward, having grown nearly three-quarters of the way round the nuts, while a root end, which had made its appearance on each germ, was with equal zeal striving downward. I then concluded to let them have their own way about it.

It is said above that the nourishment needed by the young plant till it is able to shift for itself, is taken from the seed. This nourishment consists, principally, of starch and is either stored in the embryo itself, that is, in the cotyledons, or around it. When it is stored in the cotyledons these become greatly thickened as may be seen in the germinating bean and to still better advantage in the pea and horse-chestnut. When the nourishment for the young plant is stored around the embryo, the seed-leaves are thin and get a green color as soon they are above ground.

Two of the most important divisions of flowering plants are formed upon the number of seed-leaves found in the seed. One division has but one seed-leaf and is therefore called *Monocotyledonous*, that is, one cotyledon. To this division belong all the grasses, Palms and Lilies. The other division has two seed-leaves and is therefore called *Dicotyledonous*, meaning two cotyledons. To this division belong our forest trees, the bean, pea, melon and a multitude of other plants. The pine trees have more than two cotyledons, and are called *Polycotyledonous*.

It will be interesting for young botanists to watch the germination of their garden seeds, and learn which plants have one cotyledon and which have more than one. Moreover, some plants raise their cotyledons above ground, like the bean and the melon, but others keep their cotyledons below ground and only shoot up the young stems with leaves quite like all the succeeding ones that are formed on the plant. The pea is an example of this. It is easy to insert the finger in the ground and lift the whole embryo plant just as it peeps into appearance, and then examine it carefully for all the parts that have been mentioned. Find the *ascending* and the *descending* axis, and the cotyledons; ascertain how many there are of the latter, whether they are large or small, and if they remain in the ground or are raised on the ascending stem. Nothing is more convincing or better remembered than what one sees with his own eyes.

I could continue to speak about the young plant much longer, but this talk is already long enough, and we have got the plant fairly under way from the seed. In the next talk on botany we will follow the descending axis, learn about the development of the roots and examine some of the most important forms of these.

LETTERS FROM THE COUSINS.

DEAR UNCLE:—I want to write to you and thank you for the seeds which I received some time ago. I wrote you a letter some time since which very likely you did not receive, although it was directed to you. I think that some one else at the RURAL office must have seen and coveted it. Anyway I was a little surprised to find my poor letter in the place of honor at the head of the reports from "Everywhere." I am looking forward to considerable trouble with vermin this season, as they were so plentiful last year. It was necessary for me to examine my corn every day or two and I kept my squashes free from bugs by scattering lime and wood ashes plentifully over them, but after I had tossed up my hat and crowed, I found that most of the vines were turning yellow, and I was disgusted to find that numerous worms had got the inside track, by tunneling within the vines nearly their whole length. The best way to treat Smilax is to take up the bulbs and keep them dry for a couple of months in the summer, and set them in fresh earth in the fall. I will say nothing about the weather for fear of seeing my letter in "Everywhere," otherwise I would write you three or four sheets beside this, but perhaps it would be as dry as many reports are. I believe the rest of what I have to write I will say next time.

Suffolk Co., Mass. C. A. BUTTERWORTH.

DEAR UNCLE MARK:—I received the seeds, and I am very thankful for them. It snowed here on Saturday night, the 17th ult., two inches deep in some places. As I live in Colorado, which is a dry country, we have to irrigate, which is a great deal of trouble, for sometimes the ditches overflow and flood the gardens and do a great deal of damage in one night. Last year we had a very handsome garden, but we had any amount of trouble; for once on a bright day some of the seeds in boxes were put out to get some air, and a shower came up, and as they were put under the edge of the roof so as not to burn up in the sun, the rain dripped upon them and nearly ruined them. At another time we set the boxes in an unfinished room because it was cool and moist there, and the rats ate the tops of some of the plants. We were sometimes almost discouraged, but when our beautiful Phlox and dear little Pansies and all the rest bloomed all summer long, we felt well paid for our trouble. It will be so pleasant to think that so many of the cousins living so far apart, will have flowers alike next summer. Your affectionate niece, MARY NETTIE BLOUNT.

Larimer Co, Colorado.

UNCLE MARK:—Many thanks for the seeds you sent me. I planted about half of my China Pink seed in the hot-bed and have between 30 and 40 plants up and looking nicely. We have several kinds of plants in blossom now, among them, three varieties of double Petunia, Chinese Primrose, Heliotrope, Geraniums, Sweet Alyssum, and others. We have a Heliotrope raised from seed last spring, which is five feet high, and is covered with buds and blossoms; the first bunch that blossomed was seven inches long and five inches wide. My Callas, two years old last fall, had four blossoms last winter and has two this winter besides a bud that did not open because the plant was changed from a cool room into a warmer one. We water it with hot soap suds. I want to tell the cousins how to treat Balsams: when they begin to branch out pinch off all but the main stem; the flowers are nicer and the seeds will be better. EDITH A. HUNT.

Cuyahoga Co, O.

DEAR UNCLE MARK:—I have read the cousins' letters with much interest for some time, and thought I would like to be a member of the Horticultural Club. Will you please put down my name on the list. I am very fond of flowers. My auntie and I take all the care of ours. We have not, as yet, a very large variety. I have to walk over a mile to school. We have a most excellent teacher and a good attendance. I love to go to school, and am getting along very fast in my studies. My eldest sister is a musician. In vacation I take music lessons; but when I am going to school I do not have time to do that, and attend to my studies too. Papa has not taken the RURAL very long, but likes it very much. But I must close. Good-bye. With lots of love to the cousins, and also to yourself, I remain your affectionate friend. WINIFRED STEVENS.

Dorchester Co., Maryland.

UNCLE MARK AND MEMBERS OF THE HORTICULTURAL CLUB:—I want to ask the same question that one or two others have asked: why don't more of you write? Although this is my first, if it is not rejected I shall probably write again. Have any of you sent for the system of short-hand writing advertised in the RURAL? I have and am learning it as fast as I can. I had a strawberry bed last year, and did all the work and sold a few berries. I expect to have a good many this year. Well, I must close or Uncle Mark will not let me in this time, or any other. I shall try my hand at grafting this spring. Your cousin,

Factory Point, Vt. WALLACE.

Various.

BRIEFLETS.

EARLY Amber Cane seed germinates freely, but grows very slowly for several weeks. It is not easily distinguished at this stage from grass, and it is of importance that the land should be kept clean....Plant Nasturtiums—beautiful as flowers or vines, useful for their leaves and fruit as salad and pickles....A beautiful sweet, of a most peculiar flavor, the London Farmer tells us, is made for the dessert by candying the leaf stalk in a green state of that most noble and right regal herb, Angelica....Have you ever tried Silver-Hull buckwheat?....Every garden should have a little patch of sweet and medicinal herbs, such as Angelica, Anise, Sweet Fennel, Rosemary, Rue, Horehound, Wormwood, Thyme, Sage, Caraway, Basil, Lavender, Saffron, Marjoram, Hyssop, etc....Roses need the richest soil—and it should be deep. Cow manure is excellent for them....A Minister of Agriculture is what the London Farmer has asked for, and maybe now expected as the first-fruits of the Liberals, as an overdue debt that will be paid to please and conciliate the British agricultural interests....The Mark Lane Express says that Mr. Thornton has said some very plain things to Shorthorn breeders, boldly declaring that a pedigree should be something more than a string of names. He does not believe in a return to fancy prices. If fancy prices do not return, fancy breeding will soon become a thing of the past. The Mark Lane Express would hail such a result with great pleasure, not because it wishes to see the aristocracy tire of breeding Short-horns, but because they have bred them in an artificial manner to the detriment of the Short-horn breed of cattle. . .

CONNECTICUT AGRICULTURAL EXPERIMENT STATION.

BULLETIN 41.—MAY 1, 1880.

FETILIZER ANALYSES.

385.—New York stable manure, sold by H. A. Peck, First Avenue cor. Thirty-eighth St., New York, sampled and sent March 30, by John H. Jennings, Greens Farms, from cargo purchased by him.

Moisture	69.295
Organic Matter*	19.772
Potash	.633
Soda	.145
Lime	.742
Magnesia	.288
Oxide of Iron and Alumina	.554
Phosphoric acid	.670
Chlorine	.110
Sulphuric acid	.156
Sand and Insoluble matter	7.426
Carbonic acid	.209
	100.00

* Containing 0.118 Ammonia and 0.693 total Nitrogen.

This has very nearly the same composition as the sample of New York stable manure analyzed in 1873 for the Board of Agriculture; the results published in report of Board for that year, p. 350. This, however, contains about nine per cent. less of moisture and insoluble substances and the proportions of fertilizing matters are correspondingly greater. The cost of this article was six cents per "bushel" of about 40 quarts. Mr. Jennings states that several hundred small cargoes of 50 to 75 tons each are bought at Greens Farms every year. The cargoes are unloaded on the shore where wanted.

394.—Cotton-seed meal, sold by Smith, Northam & Robinson, Hartford. Sampled and sent by R. E. Pinney, Suffield.

395.—Strictly pure bone, sold by H. J. Baker & Co, New York. Sampled and sent by J. H. Jennings, Greens Farms.

	394	395
Nitrogen	7.20	4.08
Phosphoric Acid	3.33	22.72
Potash	2.11	
Estimated value	$37.95	$43.62
Cost	$25.00*	$32.00†

* In 10 ton lots. † In New York?

S. W. JOHNSON, Director.

CATALOGUES, ETC., RECEIVED.

THE RELATIONS OF RAILROADS TO THE PUBLIC.—This pamphlet of 18 pages is a statement on the above momentous subject, prepared by Mr. F. B. Thurber, of this city, in reply to inquiries submitted to him by the Chief of the Bureau of Statistics, at Washington, D. C. Mr. Thurber has long been one of the most persistent and strenuous opponents of the unfair and oppressive freigh discrimination practiced by railroads, and in this work his views and reasons therefor are forcibly and succinctly expressed.

FOURTEENTH ANNUAL REPORT of the Northwestern Dairymen's Association, with addresses and discussions at the Annual meeting in Harvard, Ill., Feb. 10, 11 and 12, 1880. This report, of 119 pages, contains a large fund of information of interest and great use to all engaged in any department of the dairy business. Copies can be obtained of R. P. McGlincy, Secretary, Elgin, Ill., price 36 cents, including postage, and we urge every one of our readers interested in this industry to send for one.

TRANSACTIONS of the Nebraska State Board of Agriculture from Sept., 1876, to Sept., 1879. This volume, of 350 pages, contains in the first 200 pages, a great deal of useful and instructive information with regard to the agriculture of this vigorous young State, while the remaining 150 pages are devoted to its horticultural progress and advantages. Daniel H. Wheeler, Sec., Plattsmouth, Neb.

PORK PACKING AT THE WEST.—This pamphlet, of 32 pages, by Charles B. Murray, Editor of the Cincinnati Price Current, presents a complete and reliable history of the pork-packing operations at the West and elsewhere in the United States for the year ending March 1st, 1880, together with other facts intimately connected with the business.

QUARTERLY REPORT of the Chief of the Bureau of Statistics, Treasury Department, relative to imports, exports, immigration and navigation, etc., of the United States for the three months ending June 30, 1879. Joseph Ninmo, Jr., Chief of Bureau.

PROCEEDINGS OF THE NEW JERSEY STATE HORT. SOCIETY at its annual meeting, held at New Brunswick, Jan. 15th and 16th, 1879. E. Williams, Recording Sec.

DEPARTMENT OF AGRICULTURE Special Report—No. 23—upon the condition of crops and live stock for April, 1880.

THIRTY-EIGHTH Annual Report of the transactions of the Queens County (N. Y.) Agricultural Society for 1880.

PERSONAL ITEMS.

Mrs. Gillespie of Morgan County, is 103 years old, and walks two miles to church every Sunday.

Matilda Stevenson lived to be 105 years of age before she made a profession of faith, and was baptized at Paris, Ky., last Sunday.

Mrs. Waty Clark of Oswego, N. Y., still lives at the age of 106. She has been the mother of twelve children, and, until very recently, had her faculties unimpaired.

Baltimore loses another centenarian in Sarah Springer, who died recently, aged 103. She leaves thirty-one grandchildren and twenty-eight great-grandchildren.

STOCKBRIDGE MANURES
For 1880.

Some years ago the Stockbridge Manures were only known to a few farmers in the Connecticut Valley. Now they are so extensively used in different parts of the country as to require two large factories, one in New York and one in Boston to manufacture them. This increase shows what farmers think of good fertilizers, and is not only due to the fact that they are reliable, well-made, and high-grade manures, but also to the fact that farmers have

FOUND THEM PROFITABLE TO USE.

Now that corn, and other farm produce is bringing such good prices, we anticipate that farmers will invest still more largely in our fertilizers.
Besides the Stockbridge Manures, we manufacture several high-grade Phosphates, and deal in first-class chemicals of all kinds. Farmers who intend to use Fertilizers of any kind, should

McSHERRY GRAIN DRILL
Unquestionably the Best.
Sows Fertilizers splendidly. It is very accurate. It regulates by cog wheels. It is light draft. It is easily managed.
It is strictly first-class in workmanship and construction. Works to the entire satisfaction of every body who knows what a grain and fertilizer drill ought to do. Its sterling qualities have gained it a world-wide reputation, and all who appreciate excellence and accuracy, prefer the McSHERRY.
Send for pamphlet. Mention this paper.

Humorous.

THE habits of fruit are peculiar. We have seen a raisin box, a fig drum and an apple stand all day on the corner of a street.

WHAT a howling there will be among the "penny gaff" cockney actors this summer when these "blarsted Hamericans, you know," get to playing in summer! "They talk through their noses, you know, and they cawnt speak the vernacular eyether, you know.

A Word to Tourists.

You cannot have a better companion on your journey than Hostetter's Stomach Bitters. That prime medicinal agent will enable you to drink brackish water without running the risk of disordered stomach and bowels, will neutralize the influence of foul or miasmatic air, and will prove a most agreeable and wholesome stimulant and means of counteracting the fatigue of traveling and seasickness. Change of climate, water or diet, is apt to induce harassing and often dangerous diseases. The three changes combined are fatal to thousands of emigrants and travelers every year. Is it not, then, of the last importance to know that Hostetter's Stomach Bitters are an absolute preventive of the hurtful consequences arising from these causes? Travelers, voyagers, and emigrants to new countries cannot be too often remtnded of the fact that this agreeable vegetable tonic is the most reliable safeguard against disorders to which they are far more liable than the habitual denizens of healthy regions.

AHEAD OF ALL COMPETITION!
1880.

EIGHT SIZES FOR HAND USE.
Weighing from 22 to 51 lbs.
THREE SIZES FOR HORSE POWER.

The very large increase in our sales last year prove that these Machines fully sustain the awards "AS THE BEST" made to them at the great Centennial "*hundred day trial*," in Philadelphia, in 1876, and their complete victory at the Paris Exposition in 1878. We offer for 1880, Machines from entirely new patterns and greatly improved in every respect.

THE RURAL NEW-YORKER

A JOURNAL FOR SUBURBAN AND COUNTRY HOME.

Published Every Saturday.

VOL. XXXIX. No. 21. WHOLE No. 1582. | NEW YORK, MAY 22, 1880. | PRICE FIVE CENTS. $2.00 PER YEAR.

[Entered according to Act of Congress, in the year 1880, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Rural Architecture.

A $1,500 DWELLING-HOUSE.

WE here present our readers with plans of a convenient, economical and handsome dwelling-house or cottage, which was recently built by one of the RURAL'S friends. Economy and utility are the objects aimed at in these designs, the whole house having been built for $1,500. To this end, the structure is made nearly square and thus the greatest amount of room is afforded with the least expenditure of materials, the same principle being carried out also in the arrangement of the rooms. The outside appearance is pleasing and even ornamental; the piazza and deep windows in the first story, the form of the roof and the ornamental chimney give a stylish air to the whole structure, which is lacking in many buildings of double the cost.

In the first story is a spacious parlor, besides sitting-room, kitchen, pantry and hall. No room is set apart especially for a dining-room, but either the sitting-room or the kitchen may be used for this purpose, as the occupants may desire. The location of flues, grates and stoves is plainly indicated in the plan.

In the second story are one large bed-room, a living-room of the same dimensions and two hall bed-rooms, all provided with the necessary closets. The cellar is not shown in the plan, but this each builder can make of a size that will suit his purposes, either under the whole, or under only a part of the house. It is a house suited for the country or a small village lot, and is admirably adapted to the wants of a small family. If a spacious and frost-proof cellar be built under the house in which to keep dairy products, fruits and other things, it will make an excellent farm-house. In that case, care should be taken to erect it on a spot with good, natural drainage, in order to make the cellar as dry as possible, and if the ground is at all disposed to hold moisture, three or four drains should be laid about two feet below the cellar floor. Put in windows enough to properly light the room, and coat both walls and floor with cement. A light, dry, frost-proof cellar is indispensable to a comfortable farm-house. We trust the plans may prove of service to such of our readers as are thinking of erecting a new dwelling.

We will also take this occasion to urge upon our friends the oft-repeated injunction to plant suitable vines and shrubbery about the house. A dwelling-house, no matter how comfortable or how artistic and ornamental may be the design, looks, at best, bare and uninviting when unsupported by green foliage. Thus a mixture of Clematis, the Dutchman's Pipe, (Aristolochia Sipho,) Wistaria, and even the common Virginia Creeper, planted near the piazza in good soil, encircling the trellis-work and climbing over the roof, adds a charm and comeliness to the simplest cottage, which no skill of the best architects can ever supply.

Farm Topics.

THE SORGHUM SUGAR INDUSTRY.

I. A. HEDGES.

EVIDENCES are fast accumulating of the success that awaits upon the manufacture of sugar from Sorghum in the Northern States. At present the increase in the growth of Sorghum is getting ahead of the skill, throughout the country, needed to utilize the crop in this way. I have foreseen this for some time, and have urgently appealed to our Agricultural Colleges to include sugar making from this product among their regular studies. Our Board of Agriculture, here in Missouri, has awakened to the importance of the matter, and others are in correspondence with our Cane Growers' Association on the subject. I have constantly, of late, warned people against over-production. What we need now is profitable *results* from field crops. To grow one is not difficult, and in utilizing it in sugar making the days of laboratory experiments have gone by. We must now come to practical work upon a paying basis. This, I am pleased to say, is to be done this year by quite a large number of establishments of fair proportions. Of these, one in Minnesota is owned by the Hon. Seth H. Kenney; in the same State there is another at New Ulm, and a third at Fairabault. One near St. Louis is run by Mr. C. M. Schwarz, an occasional correspondent of the RURAL and Corresponding Sec'y of our Cane-Growers' Association, and our expert, Mr. C. W. Belcher, late superintendent of the Belcher Refining Company, of this city. Crystal Lake, Ill., boasts of one, under the management of your correspondent. Mr. Russell, while there are two or three in Kansas, some in Texas, one at San Buenaventura, Cal., and one at Corning, New York, under charge of Mr. C. J. Reynolds, Secretary of the Farmers' Club of that place, who will plant about 100 acres this year.

Most of the above establishments belong to organized companies, although a few are owned by enterprising private persons. The plan of organized companies is commendable, for the reason that it aggregates a community of interests and means for the enterprise, thus making the burthen much lighter individually. I say *burthen*, because at the present stage of the industry, no great financial success can be anticipated; but what farmer ever opened a new farm, either in the timber or even prairie region, and made any considerable cash deposits in bank the first year, especially if he had only just entered upon an apprenticeship in the business. Very few manufacturing concerns, with a full complement of experienced workmen, find any considerable balance on the credit side of their ledger at the close of the first year In this industry where there is one thoroughly well qualified man to lead in the general supervision, and take direct charge of the boiling, there need be no fear of a failure to attain a fair measure of success.

This fact lays stress upon the importance of an education in the art of sugar making. Suppose it should cost the State $10,000 to erect works and carry through a series of sugar-making operations on a college farm, thus educating annually 50 or more intelligent young men, and qualifying each to take charge of sugar works capable of using the crop from 500 acres of Sorghum, each acre yielding 1,000 pounds of sugar and as much more excellent molasses, for both of which there is always a ready sale throughout the country, besides affording an offal in the shape of a rich, saccharine, herbaceous scum, sufficient, when added to the seed tufts, to fatten at least two hogs to the acre, or their equivalent in neat stock—supposing, I repeat, to do all this should cost the State $10,000, how long should a wise Legislature hesitate to vote the requisite appropriation, in view of these considerations. Moreover, such college works once erected, would be self-sustaining. It may be objected, however, that there is none among the Faculties of our agricultural colleges sufficiently well acquainted with the business to teach it practically to others; but the ignorance of the Professors will certainly not be removed by the neglect of the colleges to teach the business. Plenty of folks, thoroughly well able to give ample instruction in the process, can be readily found down in Louisiana, and though their words may be uttered in the appropriate "darky" dialect, still they convey full information, and the old "coons" will soon fit the boys for graduation in sugar making. Should this source fail or be objected to, I have no doubt our Missouri Agricultural College will be prepared to fill all demands for competent foremen in a year or two.

If the farmer who intends to grow Sorghum for sugar making, expects to have good results, he must cultivate the crop with great care—no slipshod, half-done farming is good for anything in this connection; for there is no crop more susceptible of favorable or unfavorable effects from conditions of soil and culture. Last season I received one sample of cane, the juice of which was as salty as an ordinary city boarding-house's dinner soup, and on inquiry I found that the cane was grown on the saline land near Salt Lake, Utah. I have worked cane that had been grown on land freshly manured with horse-stable manure, and the steam from the evaporators as well as the flavor of the sirup both testified to the fact. But deep-plowed clover land or that fertilized with plaster or lime, will surely yield good cane.

The question is often asked me, why does this cane do so much better now than formerly; to which I answer, because of its improvement by our methods of culture. Had not Mr. L. Wray, or some one else, placed in our hands the several varieties of Imphee from the Zulu-Kaffir land, which we have been crossing and hybridizing and shifting from one latitude to another, it is probable that we should either have never included the crop in our culture, or soon have let it fall out, as the pure Chinese cane is very little sought for, nor are any of the distinct varieties of Imphee as reliable for sugar as the new hybrid, the Orange cane. In spite of all my familiarity with these canes, it puzzles me to state the parentageof this last cross, hence I adopted for it the name suggested by A. M. Schwarz, who said that when ripe it assumed an orange color in the stalk, as well as in the juice and sirup and in the seed when shelled. I shall subject it to further tests this season in order to learn its true merits, and if it fulfills its present promises, we shall have gained an important step in advance.

SORGHUM SUGAR MAKING IN NEW YORK.

J. C. REYNOLDS.

In the spring of '78, I obtained from Gen. Le Duc a small quantity of the seed of Early Amber cane, and planted it June 3d. The season proved a good one; corn ripened generally through this State. The cane ripened before my corn, and I saved perhaps 60 pounds of seed. With very crude machinery I worked up small quantities of this cane at four or five different times, one batch having been made only before frost, owing to my being so much hurried with other work. The sirup I made after the cane had been severely frozen and thawed out was decidedly the best. I have regretted since that I did not attempt to make sugar then, as the next season's crop did not mature. The next spring—1879—I distributed the seed I raised, among my neighbors, and a quantity was obtained from Washington Quite a number of small pieces were planted; but, as very few had ever had experience in planting such small seed for a field crop; and as the early part of the season was very dry, many failed to firm in the seed; others planted it too deep, and but little of it came up. It was a very poor corn season here. We had early frosts in the fall. The result was none of the cane matured, and I may safely say here, that there is no use of attempting to grow this cane where corn will not grow well and mature; but there is now no question but that it may be raised, at a reasonable profit, on good corn ground, or where corn would grow and do well.

Last fall we—that is ten of us—purchased a small one-horse Victor mill, and worked up our cane, making what would be generally accepted as a good article of sirup. We had two evaporating pans, holding 40 gallons each, and a 50-gallon defecator. We used Stewart's and Clough's chemicals and some others. Some of the sirup was better than others owing to the different modes of working the chemicals, and some was quite good that had no chemicals in it.

The farmers who grew it here were generally well pleased with the result under the circumstances. I have some of the sirup that has stood in a warm room through the winter, and 30 per cent. of it is now sugar, with well defined crystals. Some of the poorest of our sirup was sent to a chemist in New York, who reported 37½ per cent. of pure cane sugar. The results of our last season's experiments have satisfied me that we can grow in this State from 10 to 15 tons of cane to the acre, and I think I rate it low at an average of 200 gallons of sirup to the acre. The amount of sugar from a gallon of sirup will depend very very much on the soil on which it is grown. I am told that at Crystal Lake, Illinois, the juice from their cane stood a saccharometer test of but 8° to 9°, while ours went as high as 11°. The Crystal Lake factory made a good article of sugar, and 45,000 pounds for their season's work. A gentleman who assisted in working up at that place and raised 10 acres himself, told us that he considered Sorghum cane a paying crop there at two dollars per ton, as they could raise 10 tons per acre; that they could not get a profit equal to that from Sorghum, from either corn or oats. He also told me that they got but four or five pounds of sugar to the gallon. The report is in general circulation that 10 to 11 pounds can be made from a gallon. This I cannot believe until I have had more experience. Such a result might have been obtained on a very small scale from a few well-ripened stalks in the vicinity of Washington or St. Louis, Mo., but for a general field crop I think it is too high.

First-class sirup can be made in an ordinary open pan; but the sugar will be such as is known as sugar-house sugar. First-class, light sugar can only be made with a vacuum pan. I obtained the best crop by planting in rows, three-and-a-half by one-and-a-half feet in the row, 8 to 12 seeds to the hill. Then thin out to five stalks. From 90 to 100 days are required to mature the crop. I think there is no doubt but that we can raise a much larger amount to the acre in New York than they can in Ohio, or Illinois. Those who have, the past season, experimented with small mills, will perhaps be surprised to learn that with a large mill, having the proper carriers, cane to the depth of five inches on the carriers will feed through the rollers when the faces of the last rollers nearly touch each other—steel to steel—and extract but 80 per cent. of the juice, while in the small mills not more than 50 or 60 per cent. is taken out. It requires heavy mills and strong power to get a large percentage of the juice. Where a few farmers wish to obtain a barrel or two each for his own use, they can club together and buy a two-horse mill—worth say $100. I would not have a smaller one. Then have a tinsmith make three well-braced, galvanized-iron pans, holding not less than 100 gallons each; put up a large shed; build good arches for the pans, with pretty large flues to carry off the smoke, and you are ready for business. Read the papers carefully, and you will find out just how much lime to use—especially after some practical experience—and how to treat the juice with the porous alum. There will be, no doubt, many patent compounds offered the coming season for cleansing the juice. My advice would be: Don't buy them until you know for certain that some practical sugar works are using them.

Corning, N. Y.

NOTES FROM THE RURAL FARM.

We have known the RURAL FARM for the past fifteen years, and never before during that period has wheat at this season presented a sight so beautiful—so entirely satisfactory. The stems are strong, the leaves broad, the hight is uniform and the color is of that deep, rich green, that gives assurance of freedom from *all* disease. We attribute this perfection of growth to three causes: first, a thorough preparation of the land by the use of the harrow and roller; second, to early sowing, and, last, to an unusually favorable season. Perhaps we ought to add a fourth cause, viz., concentrated fertilizers which were used more freely than ever before, though by no means in extravagant quantities, except, it may be, upon several small experiment plots. Adjoining our main wheat field (Clawson) is that of a neighbor. Stable manure of a fine quality was spread over it with a liberal hand. The wheat was sown (drilled) ten days later than our own. The land is much the same; the variety of wheat the same; but the difference in favor of the RURAL field may be seen at a glance. Whether this is owing to the difference in manures, or in the time of sowing, or to the more careful preparation which our land received, is a matter of conjecture. It is possible that harvest time may tell another tale. But whether so or otherwise, every season brings to us the proofs that the labor spent in a thorough preparation of the land to be cultivated, is abundantly repaid; a commendation that, however trite, is disregarded by a majority of our farmers.

Varieties of Wheat.

We are trying Fultz for the first time. For years past we, and the farmers of this part of the country generally, have been sowing Clawson, and we have thought that for yield and hardiness there is nothing like it. But at this time the Fultz is not only ahead of the Clawson, but, as regards tillering, strength and thickness of stem, it is superior to any other of our 25 varieties. "Shumaker," sent to us by the Michigan Agricultural College, is perhaps the next most forward. This was sown broadcast upon a plot of one-twentieth of one acre, and the seeding was so scanty that the plants gave little promise, late in the fall, of ever covering the ground as they do at the present time. "Knight's Excelsior" is also looking remarkably well. This may possibly be some old variety. It was found in a field of "Lancaster" by Mr. James R. Knight, of Ohio, who sent us a small quantity for trial. Defiance and Champlain were both sown with a view to testing them as winter varieties. The former looks strong and heavy; the latter, poorly. It may be, however, that salt, sown at the rate of 240 bushels per acre, has harmed it. "Silver Chaff," "Gold Medal," "Gold Drop," "Oregon," "Bentley," Mold's "white" and "red" "Metz" have made a fine growth. "Fultzo-Clawson," a cross made by our friend, Mr. Wysor, and claimed to be the largest kernel of any known variety, is, we regret to say, considerably behind many others.

"Yellow Missouri" (from the Com. of Agriculture) has been attacked by a fungus known as Erysiphe communis. The stalks are so enfeebled in consequence that the entire plot has assumed a decidedly yellow cast. The "Asiatic" wheat is a failure, not one of the kernels having germinated. "Lost Nation," a spring wheat highly valued in Vermont and Canada, and sent to us for trial by our friend, Dr. Hoskins, bids fair also to prove a failure.

Whether for good or ill, we are planting all of our corn (ten acres) with a corn drill. It drops a kernel every 12, 16 or 20 inches, as desired, and covers nicely. Much time and labor are thus saved, if—planted in this way—the corn should thrive and yield as well as if planted by hand.

The soil is in splendid condition for working—we have neither too much nor too little rain—the sun is bright and warm and, in fact, a more auspicious spring never favored the farmers and gardeners along "old Long Island's sea-girt shore."

Field Crops.

THE "FIELD" OR "COW-PEA."

Much has been said and written of late upon the value of this plant both as a manurial agent for improving exhausted soils and as a valuable stock feed; and probably nothing has been exaggerated as to its intrinsic worth—especially to Southern agriculture. Though long a resident of the South, and generally grown, it has been hitherto treated as a mere side, or catch, crop, no particular pains having been taken to grow it as a specialty, with proper cultivation to develop large, remunerative yields.

Maturing mostly at that period of the year when our other staple crops of cotton, corn, etc., are requiring every energy, this one has been suffered to remain and be consumed at will by stock turned in to glean the fields, thus extravagantly wasting it, often to the detriment or death of the animals. As far back as twenty-five years ago, an animated discussion took place in our Southern agricultural papers, as to the benefit or value of the pea for stock. Our journals were filled with able, spirited contributions, "*pro* and *con*," some contending the pea was destructive to hogs and cattle, great numbers of those feeding on it dying in the spring, especially upon the lime lands of Georgia, Alabama and Mississippi. Some planters even abandoned the production of the plant, owing to such losses regularly occurring among their stock. It was contended that the limestone waters consumed with this food in the fields, had to do with this sure annual mortality among stock. At last, the general conclusion was reached that some varieties of this plant—even the most valuable—when eaten greedily by cattle and hogs, would produce very serious consequences. Late varieties—vulgarly called "Tory" pea, "Little Black," "Red-ripper"—small and hard when taken into the stomach of the animal without due mastication, were as fatal as a surfeit of clover; while larger, softer varieties might be eaten without any apparent evil consequences.

The hogs were observed to die in spring after having been fattened upon the pea, and there was no known help for the peculiar wasting that occurred after this crop had been eaten and the animal, depending upon Indian corn and poor pastures for support, died. Such is the fact; and great precaution must be used in feeding hogs when taken from a surfeit of this food. I think the cause of this can be satisfactorily found in the sudden development of the animal upon highly concentrated food followed in the spring by as sudden poor and insufficient aliment like that usually given here to stock; hence they are predisposed to fall victims of every disease. But this does not destroy the value of this plant as an article of stock food. Analysis proves its highly nitrogenous, muscle-making qualities; and when properly prepared in coarse meal, or boiled or steamed, there is nothing to compare to the pea as a milk and butter-making element, as it produces the richest, sweetest-tasted milk and cream, not excepting that produced by clover, to which family it properly belongs.

A very fine combination of food for milch cows, I have been using for years, is the following, and if any one can produce a better in the food crops we have, I would be pleased to see it:—two bushels of corn meal, one of pea meal and one of cotton-seed meal, mixed well together, with hay or dry forage during winter and green pastures in summer, form as complete a grain sustenance for the animal, with abundant elements of pure, sweet milk, as can be found in any other combination; oatmeal also added might improve it. Two quarts of this nights and mornings, with hay or grass, form a cheap and perfect food for cow and calf.

The varieties of the pea or bean—as 'tis now changed in its family relation—are very numerous, and have been probably produced by sports of nature and by mixing. There are, however, distinct early and late-maturing varieties, the members of each class having their special advantages in our Southern agricultural economy. The varieties commonly known here as Speckled, Partridge and Goat-peas, will, under a summer sun, ripen in 60 to 70 days from the time of planting. The later sorts, as Clay-Bank, Tory, Little Black, Red-ripper, planted in June, ripen in this latitude (33°) late in October or November, if the frost does not interfere too soon. These later sorts are great runners, and are esteemed highly for manurial purposes, affording vegetable matter and a fine cleansing crop for other rotations in grain or cotton.

Of the benefits of the pea in Southern exhaustive farming, much could be written. Its wealth of vine and foliage, promises to add largely to the supply of humus which is being exhausted from our soils by the constant use of hoe and plow. It will also prove valuable for the Middle and even Northern States for this purpose. Some earlier varieties that require only 60 to 70 warm days to mature seed, will develop quite a long way North. 'Tis known that the Chinese in their wonderful economy in manurial agencies, have employed this, or similar bean plants, for ages. Flooding their plats of land where these have been grown broadcast, they tread the vines into the soil or mud with their feet, in preparation for a cereal or a cotton crop. With our sparse population and cheap lands, we find, however, plow and horse cheaper machines than human muscles, for by these means larger areas can be successfully manipulated and turned under at proper seasons, giving life and renewed vigor to old lands in the production of grain or cotton.

Burke Co., Ga. W. B. JONES.

Orchard Grass.

An article in the RURAL, page 297, speaks deservedly highly of this grass for grazing purposes; but adds, "it is but an indifferent plant for hay, yielding a light crop of woody, fibrous fodder." This latter is owing to grass being left to form or ripen its seed before cutting. It should be mowed, to be cured for hay, just before or at the moment it begins to blossom, and, as it is a coarse grass and dries quickly, it should not be left exposed to the sun any longer than, if even so long as, rank timothy. On good soils the yield thus will average fully two tons per acre of as good and palatable hay for stock as red top or timothy. I have occasionally seen nearly three tons thus cut and cured from an acre.

One-and-a-half to two bushels of seed are recommended to be sowed to the acre. Better sow three bushels; then it fully stocks the ground, and does not come up in bunches. No other seed ought to be sowed with it, not even clover. My orchard grass on the first of May, although the past April was extra-cold and the season late, was 7 to 13 inches high—almost thrice the hight or any other grass, and nearly double that of clover. C.

GROWING THE SUGAR BEET AND MANGEL WURZEL.—Mr. William Crozier, of Northport, Long Island, is one of the most successful and

largest growers of root crops for stock feeding in the United States. In one respect his application of fertilizers is different from any we have heard of in our country. Before planting, he manures the land well with stable dung, then when the crop gets three to four inches high, he mixes 100 pounds of blood guano with 200 pounds of fine bone dust and 400 pounds of coarse salt, and spreads this amount of mixture, broadcast, per acre. The salt is refuse, and costs only $3 per ton in New York City. After spreading the above compost, it is plowed in lightly with a horse cultivator running between the rows of roots. Mr. Crozier learned this method in Scotland. One would suppose as his farm is only a few miles from the ocean, salt would be of little benefit, but he finds it not only good for roots but also for wheat.

Floricultural.

GARDEN FLOWERS IN MAY.

WILLIAM FALCONER.

THE wealth of blossoms everywhere apparent during the month of May, is far too great for reference in one article; hence I will confine myself to a few of the prettiest among the hardy plants, and which are now (8th) in bloom:

PHLOXES.—Moss Pinks, white, red, pink and crimson, are solid carpets of flowers, and they luxuriate in open, dry, sunny spots where little else will grow. They are at home running wild in the grass or scrambling among stones, and are capital things for covering sunny banks. Their evergreen nature renders them cheerful in winter, and they are very hardy. Other verual Phloxes, like reptans and amœna, are showy and profuse and excellent garden plants.

CANDYTUFT.—The evergreen Candytufts are desirable border plants, and, according to kind, are from now until July a snowy mass; these will be succeeded by annuals of various hues—white, lilac and purple. Their relative, Arabis albida, or Rock Cress, has been a mass of white since a fortnight; and the Aubrietias, mossy clumps of purple and lilac The Rock Cress is very hardy and easily grown, so are the Aubrietias, only they prefer less sun heat than they sometimes get with us in summer.

PINKS.—It is too soon for Pinks yet, but their friends, the Chickweeds, are advancing in force. There are some fair Cerastiums; but C. tomentosum, a dense wooly-leaved one, is one of the best, though not always reliable. Stellaria Holostea, a common European wood plant, is one of the very finest hardy plants I know of. Grown in masses in sunny places, it is now a carpet of green checkered with opening buds that, in a week, will expand to snow-bank denseness.

SAXIFRAGES,—The large-leaved section, as Crassifolia and Cordifolia, are well suited to our gardens, and bear massive pinkish-purple flower bunches in April and May; they are evergreens, but rather coarse. S. ligulata, from the Himalayas, is earlier and prettier. S. ciliata, from the same place and as early, is not so reliably hardy. S. peltata, the California Umbrella-plant, from rough and naked root-stocks has sent up many ample pink bouquets, handsome while they last, but in a week they will be gone to be immediately succeeded by leaves two to four feet high and like great, green umbrellas. It loves a wet place, and will even grow in water. Our Virginia and Alleghany Saxifrages are also in flower. The mossy Europeans do not thrive here as ordinary garden plants.

GLOBE FLOWERS.—The European and Asiatic Trollius are handsome garden plants, with yellow and orange flowers, and nearly allied to the pretty spring Adonis which is now past its best. The Marsh Marigolds, single and double, too, are very showy; they like a damp or wet place.

ANEMONES.—The woods are aglow with wind flowers; these, together with the purple, rose, and double-flowered varieties of the same, are good garden plants when they get a little summer shade. The double red Anemone fulgens is better suited for frames than open borders. The European Pasque Flower and Nuttall's form of it, are both good and seasonable garden favorites. The Rue Anemones and the pretty little Isopyrum biternatum, from the West, are much like common wind flowers, but larger and more copious.

PRIMROSES.—In a shady rookery English Primroses are as vigorous and floriferous as if at home in a Kentish wood or Surrey glade, and beside them in equal thrift are growing Polyanthuses and other single and double garden Primroses. The Cashmere Primrose, a new species from Asia, is equally hardy, and unfolds its globular heads of lilac blossoms while the other sorts are still unresurrected. It is not the cold of winter that destroys these gems in our gardens, but the summer's heat and drought, muggy, warm weather succeeding drenching rains, and exposure to sunshine in winter.

IRISES.—A great many varieties of the common dwarf Iris are now in bloom; also the pretty I. cristata and a few other species. They will soon be succeeded by larger and more showy kinds. Most of the bulbous Irises are past. All are accommodating garden plants.

TULIPS.—These in gandy array are at their best, or in open warm places nearly done with. The variously streaked sorts so common of old, are losing favor, and "selfs," that is those of one color only, becoming fashionable. The species are as beautiful as the varieties, and perhaps T. Greigi, a species with large, glowing red, cup-shaped flowers with dark spots at the base of the petals, and brown-spotted leaves, is the handsomest of all. Tulip blossoms are of various forms as well as of many colors; some are cup-shaped, others open and reflexed, some, like Acuminata, have long, narrow-pointed flower leaves, which in others, like the Parrot Tulip, are very ragged. They are excellent garden plants, and if in good soil and left undisturbed, they increase yearly in vigor and number.

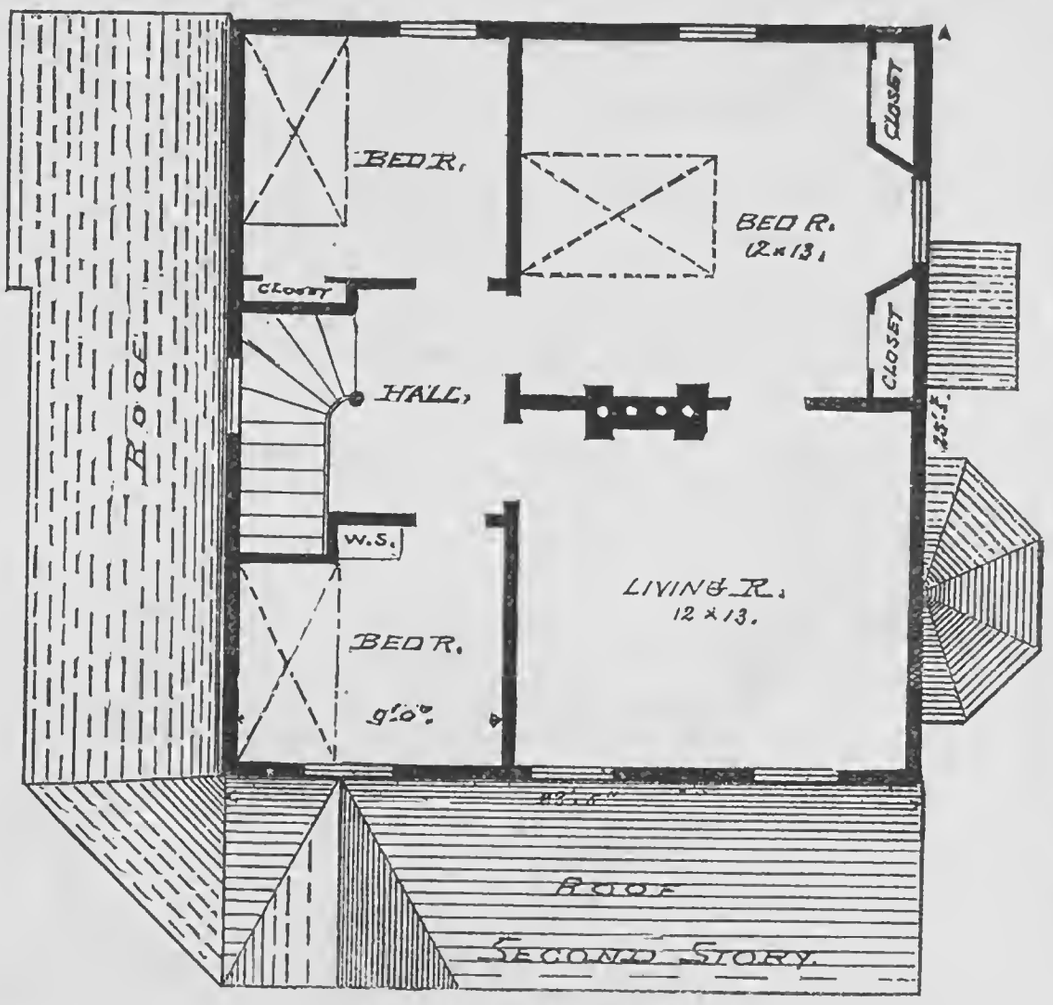

FIG. 172.—SEE FIRST PAGE.

DAFFODILS AND JONQUILS.—These are good and desirable plants. In good, moist earth they are quite at home. There is an immense variety of these Narcissuses, and all the cheap ones are hardy, free-flowering and well worth growing.

DICENTRAS.—D. spectabilis is one of our very finest garden plants; it is usually known as Bleeding-Heart. A young lady at our Cambridge high school says—she "guesses there are more bleeding hearts among the boys at her school than there are in the borders at the Botanic Garden." But there are other pretty Dicentras, like D. eximia that lasts the year throughout; D. Cucullaria that blossoms in the spring and dies; and many kinds of Corydalis, which are near of kin to the last—as C. aurea, nobilis, tuberosa, and the like.

OTHER BEAUTIES.—But these do not comprise a tithe of the beauties of this May-day: The creeping Forget-me-not is wandering all over the rockery, and many kinds of white, yellow and blue American Violets are scattered, like weeds, among the stones. Viola cornuta and some of its varieties are quite handsome, and though not here, as in Europe, applicable for bedding purposes, are quite showy in a moist border. Last year's Pansies have scattered seedlings hither and thither, but all poorer than their parents; hence we must get our Pansies by selection, care and, if possible, frame culture. Lady-loves, harbingers of spring, are lovely weeds. Epimediums from Japan, white, red, purple and lilac, are handsome in the borders, where, too, the spring Orobus is a cushion of purple, and Doronicum Caucasicum, a mass of showy yellow. The Dogs-tooth Violets of American and European origin and of many colors, white, yellow, rose and purple, and with plain or variegated leaves, though past their best, are still in profusion in the rockeries and wild places, and borders of Periwinkle ("myrtle") are studded over blue or white. Clumps of Bellworts luxuriate in wood-like places. Spring Beauty is at home in the same situations, and Helonias bullata has reared aloft its rose-knobbed drumsticks by the spring. Trilliums, white and purple, plain-leaved and mottled, are blooming among the bushes and rocks, in company with a host of other pretty wild flowers.

Pomological.

FRUITS IN MINNESOTA.

APPLES.—The list of large Apples that can be grown in this State is very short. The Tetofsky, Duchess of Oldenburg, and Wealthy are the only ones recommended for general cultivation by our State Horticultural Society. Some others, like the Haas and Alexander, do well in some localities, but cannot be relied on. The Tetofsky and Duchess are already well known, and the Wealthy is becoming so. This is a seedling which Mr. Gideon, of Lake Minnetonka, its originator, claims is a cross between the Crab and some large Apple. That it has some Crab about it, is evident from the fact that some trees grown from the seeds of the Wealthy, bear only small crabs. It is a very valuable Apple for our State, in fact, for the entire North. The tree is a fine, vigorous grower and seems as hardy as most of the Crabs, and the fruit is large, of fine color and quality, and will keep till midwinter. What we are most seeking is an Apple equally hardy and good that will keep till spring; and we think we shall find it by and by, as every fruit grower in the State is trying for it. Of the Crabs we have a fine variety, ripening from the first of August till spring. The Early Strawberry [We do not know of a Crab of this name.—EDS.] is the earliest and among the best. As an eating apple it is equal to the Tetofsky. Then follow the Transcendent, Hyslop, Orange (?), Bryer's Beauty, Meader's Winter, Minnesota and some others. And most of these are excellent for eating as well as cooking.

PLUMS.—With the tame Plums we can do nothing; and many of the native Plums from States south of us, like the Miner and Lombard, and I might add, the Weaver and Wild Goose, utterly fail. These latter, perhaps, should be further tried, though I have no confidence in them. Some of our native Plums are very fine.

CHERRIES.—The Early Richmond and Kentish Cherries try hard to stand our severe winters, and sometimes make quite a success.

PEARS.—I have one Pear tree, Clapp's Favorite, on Mountain Ash roots, which I set in my grounds, as a graft, the spring before the "hard winter of '72 and '73," which has never been killed down. The Flemish Beauty was top-killed for several years, but has stood the past five winters. On the whole, we cannot depend on growing Pears.

THE SMALL FRUITS all do well, except Blackberries. The Doolittle does the best of any of the Black Caps, and the Turner and Philadelphia of the Reds. The Wilson is the chief Strawberry, but the Charles Downing is increasing in favor, and some of the best of the new seedlings are being tried. Of Currants, the Red Dutch, Victoria, White Grape and Black Naples, are all that can be desired. While we cannot grow a great variety of fruit, what we do grow are the best of their kinds. I speak of the open prairie in the center of the State. In the southern and eastern parts of Minnesota on the Mississippi, some varieties succeed, that fail here.

Meeker Co., Minn. G. W. FULLER.

Cherry and Pear Trees for the Lawn.

I wish Mr. Williams would add to his excellent article in the RURAL of May 8, on cherry trees, a list of such as grow up of the handsomest shape and largest size; also, the same of pear trees; for these, in one respect, are more ornamental than Cherries, because, in addition to their lovely blossoms in spring, they show such an abundance of rich, luscious fruit from July on to November.

All along the north side of Long Island, in Westchester county, and I dare say in other localities, cherry trees may be seen of a girth of nine to ten feet, and perhaps more around the trunk several feet above the ground, and 35 to probably even 50 feet in hight. I know trees of the grand appearance of a medium-sized Oak, and at a little distance from them, they might be taken for such.

Certain kinds of pear trees in a favorable soil attain an equal size; and both may be made a beautiful adornment of the lawn. When in full bloom such large tree are scarcely less showy and magnificent than the Magnolia; for although their flowers are so very much smaller, the great abundance of them makes up a mass quite equal in appearance to the large ones — at least, a short distance off. [But they do not last half so long.—EDS.]

In the vicinity of Detroit, and I believe also on the west bank of the Niagara River above the Falls, pear trees may be seen 60 feet high, and still bearing fruit, although planted by French settlers two centuries ago or more.

There is one sort of Cherry at present little known among us, called the Dychouse, which is particularly ornamental for the lawn. Those I have, grow up in the shape of a hay cock, with long, pendant branches reaching nearly to the ground, like the Weeping Willow. The hight of mine at present is only seven to ten feet. In richer ground they would doubtless have grown much larger by this time, as I procured them from Kentucky, and set them out in the spring of 1871.

The merit of this sort of Cherry, aside from its being ornamental, consists in its hardiness, growing fairly in a poor soil, and producing annually an abundance of fruit which in size and flavor is much like the common pie cherry. When fully ripe, it is tender, juicy, and slightly spicy; and although too tart for the taste of some, for my own part, I am very fond of it. Another great merit—the birds are rather shy of this fruit. A. B. A.

Arboricultural.

HOW TO GROW AN OSAGE ORANGE HEDGE.

JAMES HOGG.

THERE are two methods of raising the Osage Orange, one from seeds and the other from cuttings of the root. The tree is dioecious; that is, some of the plants are male, bearing only staminate flowers, while others bear pistillate flowers and seeds, but both are alike available for hedge purposes. Each fruit produces a large number of seeds, about 5,000 of them filling a quart measure. The tree is closely related to the Mulberry, and its large orange-shaped berry is an aggregation of numerous seeds with their pulpy adherent matter closely compressed together and adherent.

It will not do to sow the oranges or fruits in the soil in their natural state, as it would be a great waste of seed and the plants would come up in thick clusters. The proper way is to buy the seeds of some of our leading seedsmen who have them by the bushel. The seed is mainly procured in Texas or Arkansas, and is obtained by washing the ripe fruits in water until all the pulp is washed away; the seeds are then dried and are ready for market. The seed should be sown either in autumn or spring, choosing a good piece of well manured garden soil, well spaded and pulverized. Open drills with a hoe—as you would for peas—from six to eight inches apart, sow the seeds about two inches apart and cover them about an inch and a half deep. When sown in the autumn, they will not make their appearance until next spring. When the plants are up, all they need is an occasional hoeing or stirring of the ground and to be kept carefully clean of weeds. If the soil is very strong and rich, they may be suitable for transplanting after one year's growth, but they generally require two years' growth for this purpose.

The best season for planting hedges is as early in the spring as the ground is mellow enough to work well. Spring planting in our northern latitudes is to guard against the heaving out of the young plants by the coming out of the frost at the breaking up of winter. Southward, where this does not occur, autumn planting succeeds very well.

The line of fence or hedge should be laid out and plowed and finely pulverized two or three feet wide; then stretch a line for any convenient distance and dig out a trench eight or ten inches deep, keeping its upright or firm bank next the line; then on the opposite side dig another trench six inches from the first line, and in these two trenches set the young plants twelve inches apart, breaking joint in the second row with those of the first line; that is, set the plants of the second row midway of

the spaces between the plants of the first row. As the plants are set, fill the earth into the trenches and press it firmly round the stems of the plants with the foot, and, finally, level the whole off nicely with a rake or hoe.

Previous to planting, the plants from the seed-bed should be carefully sorted out, and those of corresponding size and strength planted together. Each plant should be cut down, before planting, to within two inches of its ground line in the seed-bed, and all the larger roots shortened back about one-third of their length. Care must be had not to allow them to become dried by the wind or sun. The season after they are planted each plant will throw up several shoots; these are to be shortened back the ensuing spring to within six inches of the ground; and then for the ensuing five or six years the growth of each year is to be shortened back to twelve inches, making the hedge five and a half or six and a half feet high at the end of the term. The hedge should be kept gradually trimmed on the sides as it grows, to make it thicken, observing to so trim it that the sides have a sloping form, and not a perpendicular one. The sloping form gives the light and rain a better opportunity to act on the foliage than does the perpendicular one, and so prevents the hedge from becoming bare at the bottom, and also prevents the top of the hedge from being broken or spreading out of shape owing to the weight of heavy snows in winter. Early in the spring or in the autumn is the best season for trimming a hedge; summer trimming in this climate, owing to our intense summer heats, is always injurious, as the plants are too suddenly checked in their growth, and are rendered liable to attacks of mildew or other diseases.

No weeds, especially coarse-growing ones, should be allowed to grow near a hedge; they are sure to injure it, and often produce gaps in it by smothering its growth. It is only vexation and vanity of spirit to plant a hedge unless you mean to take good care of it. Doing that, it is the cheapest and most beautiful fence you can have, and fully repays the cost and time it requires to get it into shape.

THE AGENCY OF INSECTS IN FERTILIZING KALMIA.

PROFESSOR W. J. BEAL.

In an editorial of the RURAL for April 24th, there are some sound remarks about "The dependence of flowers upon insects for their pollenation," and "jumping at conclusions." The writer says, "It has been stated that Kalmia latifolia is of this class." "The theory is that insects at this stage of the flower's development, working at the nectar tubes below, free the anthers from their pockets, whence it follows that insects are essential to the fertilization of the Kalmia ovules!" He adds "The writer of this note for a week or more past, has had the opportunity, among the Kalmia groves and thickets of South Carolina, of observing how entirely mistaken this pretty theory is." He goes on to say that he has seen the anthers liberated from their pockets in the corolla without the aid of any insects. He has seen these things with his own eyes, and I have no doubt he has seen correctly. This shows the need of careful observations and frequent repetitions of observations in different places and under different circumstances. The author referred to, if he is well read on the subject, must know that many examples have been discovered in which plants were developed in a different manner in different countries, and that insects act differently on plants in different countries. We must be careful and not do what the author of the article has done in this case—"jump at conclusions."

Some time in 1866, when a student at Harvard, I spent many hours watching the behavior of honey bees and wild bees on Kalmia angustifolia, and took notes on the spot. The plants were thriving in their own home. Two years later some of these notes were printed in volume first of the American Naturalist. The particulars are given describing the behavior of the insects as they are seen to pull the stamens from their pockets. "A single visit from an insect is sufficient to release all the anthers. By noon it was a difficult matter to find a flower which had not been visited in this way." Further on the notes read. "Insects seem to be absolutely necessary for the perfect fertilization of Kalmia angustifolia and K. latifolia (planted in the gardens), for I tied small sacks of mosquito netting over some flower clusters, and found that when the bees were kept away, the flowers withered and fell off, most of the anthers still remaining in the pockets, and the filaments so decayed that their elasticity was entirely gone." Other remarks follow. My conclusion, so far as the plants I studied in that place in 1866 are concerned, I still have no reason to doubt, but I was not authorized in concluding that all plants of these two species in all countries were fertilized in the same manner. In his neat little book on "How Do Plants Behave," Dr. Gray refers to my notes as authority for his statements on the fertilization of Kalmia by bees.

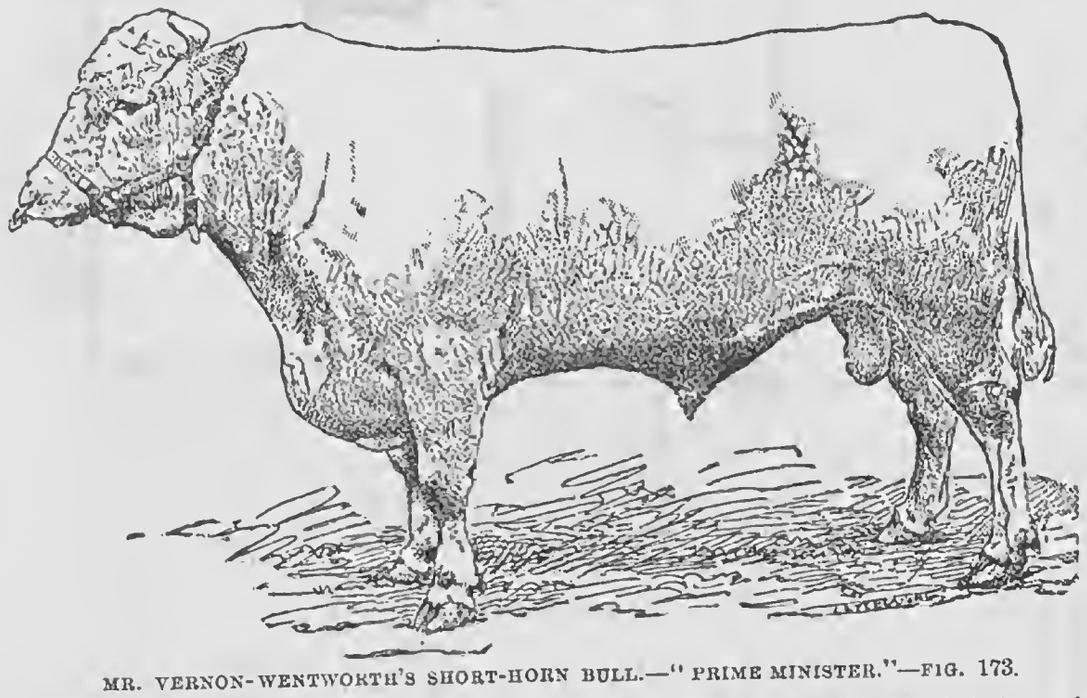
Plantago lanceolata has often been mentioned as a plant the flowers of which are not visited by insects. The pollen is dry and shakes out easily. The wind no doubt aids in scattering it, but I have repeatedly seen bugs, flies, and small wild bees crawling about these flowers. Many examples of a similar nature could be given.

The Herdsman.

OUR ANIMAL PORTRAITS.

"Prime Minister."

We have frequently here given portraits of choice Short-horns belonging to aristocratic tribes or families, which from the earliest days of their calfhood were carefully fed and handled



MR. VERNON-WENTWORTH'S SHORT-HORN BULL.—"PRIME MINISTER."—FIG. 173.

for the show yard. As a rule, these were more useful as specimens of what care and good treatment might do for an animal of choice original stock, than for any good they did by perpetuating the special excellencies for which they won prizes and renown, for the preparation for the show yard is hardly conducive to prolificacy. In the accompanying portrait of Prime Minister, reproduced from the English Agricultural Gazette, we present to our readers a beast of a character entirely different from that of these showy selections, although an animal as well-shaped as need be, but heavy and useful rather than calculated to catch the public eye and win the crowd's admiration. With the exception of winning 1st prize as a yearling at the Malton show, in Yorkshire, in 1877, his life has been happy in that it has been uneventful. His owner, Mr. F. W. J. Vernon-Wentworth, has since used him in a good herd of heavy Yorkshire cows, and the calves of his "get", which are not needed in the herd, are eagerly sought for by the tenantry in the neighborhood, a demand satisfactorily explained by his good outlines and serviceable pedigree. His immediate progenitors, like himself, were useful rather than showy animals, both on the side of sire and dam, though he has in him the blood of Lord Ducie's Bessy tribe, the Honeys of Kingscote and the celebrated Princesses. Although his sire and dam are both in the Herd Book, his name finds no place there. It is to bulls of this homely sort, whose prime lineage is enhanced by desirable personal qualities, and which have not been deteriorated by pampering, that we must look for the improvement of our herds, rather than to animals whose dead ancestors are their chief merits, or whose highest glory is that they have been the pets of the show yard.

ANGUS CATTLE.

This is a black polled breed of cattle, peculiar to Scotland; and its improvement from stolen crosses of Short-horn bulls on the females, has increased their size, refined their points and enable them to mature at almost as early an age as Short-horns. Taking a remote cross thus, and then breeding strictly back has not struck off a single shade of pure glossy black color of the Angus, or lowered the quality of its beef, which has ever borne the highest price of any sort in the British market except that of the Highlanders.

Being extra-hardy and thrifty, it is a matter of congratulation that a few Angus bulls were imported into Kansas in 1873, by the late Mr. George Grant, to help stock his Victor settlement there. Mr. Clark, who was associated with Mr. Grant in stock breeding, took four of these Angus bulls for himself, and crossed them on the poor native cows of the State, called Cherokee. The half-bred produce of these was a wonderful improvement, about two-thirds of the calves coming black, and growing up hornless. The steers are of extra-quiet disposition, hardy, thrifty, and fatten easily and kindly. When brought to the Kansas City market they brought a higher price than any other cattle, and a greater demand immediately sprang up for them from the butchers than Mr. Clark has been able to supply.

Mr. Clark is now going to import both bulls and heifers from Scotland, for the purpose of breeding the pure stock in Kansas hereafter. He will, doubtless, be able to dispose of their calves as soon as fit to be weaned, at high prices, and thus make the importation not only profitable to himself, but highly advantageous to the country.

The late Mr. Wm. McCombie, of Aberdeen, Scotland, was the greatest improver of Angus cattle, and took first prizes wherever he exhibited his animals, not only in Scotland and England, but also in France. On one occasion, at the Falkirk market, his father exhibited about 1,500 head of black polled cattle, but he was a cattle dealer rather than a breeder, and these were then of the unimproved sort. The son, of whom we have spoken above, usually kept 100 head of choice animals for his own breeding stock, and when Queen Victoria made him a visit, he had 400, gathered from his own and neighboring herds, brought together for Her Majesty to look over, which she did with the greatest admiration. When will our cattle breeders exert themselves in the same way to gratify the bovine taste of their fair countrywomen?

We regret to see that a prejudice is entertained against these superior animals in New Mexico, and some parts of Texas, simply because scrub Mexican black, hornless bulls and cows of Spanish descent, have been long bred there. This causes the ranchmen to think the Scotch the same as their own natives. But if they would only consider their much greater size, superior form, and finer points, their prejudices against them would immediately give way. We fear, however, they are too ignorant to do this, and in consequence of it will deprive themselves of the means of making a great and rapid improvement in their herds, unless they resort to Short-horn bulls, which, of course, would improve the native stock still faster, except in the matter of leaving more or less of horn upon their progeny.

Dairy Husbandry.

HISTORY OF A POOR FARM.—No. 25.

Milk, Its Value and Cost.

Milk producers are the worst-used individuals. Few other persons are so maligned, suspected, abused or deprived of the ordinary liberties of a citizen. A man may take suet or beef-fat and work it up into the semblance of butter, and palm it off on an unsuspecting public with impunity. Another may sell glucose for sirup or honey; or chicory for coffee, if indeed worse stuff is not prepared for the coffee pot, and no man can say a word to him—that he cares for. But if a customer wants a few gallons of cream from a milk-man, the good skimmed milk must go to the pigs; for it cannot be sold to the thousands of poor persons who live in towns and cities, without breaking the law. At least this is the case in the large places, where the milk business is under the strictest regulations.

"That is all wrong" remarked Dr. Jones. "Skimmed milk is as healthful a food as pure milk; it is not so rich, that is all. The Boards of Health, who have charge of this business might as well prohibit bakers from selling bread without butter as a dairymen from selling milk without cream. Thousands of poor people are often glad to eat their bread dry, and would as gladly drink their milk without cream. In fact, skimmed milk and bread are a most excellent food for young and old persons, and for some the skimmed milk is better than full milk."

"Skimmed milk could be sold in the cities and towns for three cents a quart; any milk-man could find customers on his route, who could buy three quarts of this milk for nine cents with more advantage than one quart of whole milk at 10 cents. The difference would be equivalent to a full meal in place of semi-starvation for many a poor family; while for others the extra two quarts of good milk would mean pies, puddings, custards, and many other delicacies for thousands of families who are not poor, but are forced to practice economy."

"I don't see how the poor women in the towns and cities can get along and feed their families with so little milk," remarked Miss Martin. "I believe a pint is the average quantity delivered, and that will simply color a few cups of tea and coffee. For cooking, skimmed milk, and sour milk, too, are indispensable; and what a number of nice dishes may be made of it. I never throw out sweet skimmed milk to the pigs without feeling as if I were wasting good human food, 'taking the children's bread and casting it to the dogs,' as it were. I wish I could sell my skimmed milk for one cent a quart. That would add to our income and I have no doubt, as you say, be a great help to a number of poor people."

"There is a good deal of foolishness in the world" said my old neighbor "and I notice it more now than when I was younger. What a pity folks cannot be honest; then we should not need to be troubled with so many laws and rules at every turn. But why is it that the dairymen get two cents a quart for their milk, and those who buy it pay eight or ten cents?'

"There is a good deal squeezed out of milk" I replied. "A farmer can make milk for two cents a quart, with a fair profit. The railroads could carry it 100 miles for 20 cents a hundred pounds in place of 50 cents or a dollar which they now charge. That would bring it into market at 2½ cents. By a systematic delivery, skimmed milk being sold at the same time and double the quantity being delivered by each wagon, the cost of distribution would be about 2½ cents, making the total cost to the consumer five cents in place of eight or ten now. This reduction would lead to a large increase in the demand; more cows would be kept and the cost of keeping 40 cows in place of 20, would be reduced proportionately. More manure would be made and the poor farms in the country would soon become rich. What enormous results often spring from very insignificant causes!"

"Hold on a minute!" said Mr. Martin. "That all depends. How can a farmer produce milk for two cents a quart? Let us begin at the beginning before you fly up so high on that big manure pile."

"A cow," I replied, "will consume 20 pounds of hay and eight pounds of meal in a day. These are worth 18 cents. These are the dearest kinds of food. I can feed a cow as well by substituting corn-stalks, roots, straw, coarse hay, malt sprouts, cotton-seed meal and rice-meal for three-fourths of the hay and corn meal, at one-half the cost or less; so that the 18 cents are reduced to about 11 cents a day. How are your cows milking now, Miss Martin?" I asked.

"Only eight are milking now, and I am getting about 220 pounds a day."

"That is equal to 100 quarts, or an average of 12½ quarts, and you have two cows dry. The 10 cows are yielding, then, at two cents a quart, $2 daily, or 20 cents each, including the dry ones. Mine are doing better than that, as I have some heavy milkers, and my herd is much improved since I replaced some natives with Ayrshires. Twenty cents a day leave some profit anyway, if not out of the milk, at least out of the roots, hay straw, fodder, etc., etc.; which must be marketed that way or not at all."

"My cows won't do that," remarked the old gentleman; "we don't get five quarts a day, one with another."

"Our cows are poor ones, grandfather," replied William. "We have had no change of stock since I can remember, and some of them are very old."

"Yes, I know, they are like myself, worn out: but they were your grandmother's calves; she raised them—the last she raised; and as long as they can eat, poor things! they shall have a home and something to eat. Next year you shall have some Ayrshires; but the old cows shall stay; our old stock is run out and we must change; that is certain. Our old ways are of no account now. They used to do for us; but we wanted little then, and now one wants a good deal. How the world moves, surely! My old head could never do the figuring that has to be done now to live. It is worse than the old school books which I thought were made up to puzzle the boys. Here is Fred figuring and figuring night after night, and you have to come to a matter of three cents a day in the keep of a cow, to make ends meet. We didn't work so close as that years ago. I see how it is. Men are crowded now where they used to have elbow-room; and if one does not push and elbow his way with the crowd, he will lose his place. I am glad I am out of it. Here's Fred telling me of growing plants under the electric light, so that they can grow night and day. What are we coming to?"

"Who can tell?" replied Dr. Jones. "The

period is one of wonderful interest, and agriculture is by no means behind other interests in this respect. What is in store for the young folks cannot be dreamed of, any more than we could have imagined, 25 years ago, what are now affairs of the commonest kind."

"Don't let us borrow trouble," said I. "We are living in the present. Let the young folks take care of their own world and time, as we have taken care of ours, and as the old folks took care of theirs. The human race will live, never fear. The question now before us is, can we live by making milk at two cents a quart. I would like, certainly, as our old friend remarked, to have a larger margin than three cents a day on the keep of a cow, but as a Mercutio once remarked of a wound, "It is not as deep as a well, nor as wide as a church door, but it is enough." If one can secure even three cents a day, clear profit, on a cow's keeping, he is safe; but we can do better than that, even in selling milk at two cents a quart."

"Be sure of one thing," said Mr. Martin, "and that is, one must figure closely whatever work he is doing. We *are* crowded; that is certain; and in a crowd there will necessarily be squeezing and pushing. In fact, we must make up our minds to work for a living only. Against that we shall always have the advantage—which some have not—that our living is a safe, sure and agreeable one."

"If we can make our cows pay for their feed and something over, without counting the manure which will produce other crops for sale, I don't see that we have such a bad business." said Fred. "If we get on this farm 1,000 bushels of early potatoes and 100,000 ears of corn to sell this year, which we expect, from the 400 loads of manure we have made the past winter, and have the cows pay their expenses, I think the poor farm can get along."

THE MILK TRADE.

The milk business is not a satisfactory one to the producers. By the strictest business methods, hard work and some skill in managing his dairy, one may produce milk for two cents a quart. But what other person than a dairyman is expected to sell his product at cost? Yet, on the average, two cents is about what milk brings to the producer when it is shipped to city markets. Sometimes two-and-a-half cents may be procured and occasionally an unusually fortunate man may get three cents the year round. But the latter price is exceptional and is the result of a permament arrangement with some particular dealer who has a specially good class of customers. Now, if two cents are to be taken as the ordinary value of milk to the producer, one that is interested in the business very naturally inquires who gets the difference between that and the usual selling price in the cities, which is six or eight cents a quart. To pay 200 or 300 per cent. of the value of any staple article for the service of distribution, seems to be excessive, and fairly beats the cost of carrying grain to market, which is rarely more than 200 per cent. of its first cost, and it is carried 1,000 miles; while milk is seldom carried more than 100. In the first place, the railroads exact one-and-a-quarter, one-and-a-half, or two cents a quart for transporting milk from 20 to 100 miles. For 20 miles I have paid one-and-a-quarter cent per quart on "special rates," which is considered a favor. The milk I am now sending to market nets me two-and-a-half cents on a contract with a dealer; one-and-a-quarter cent for freight added makes three and three-quarter cents.

The milk, I know, is retailed at six cents, which gives two-and-a-quarter cents to the retailer for delivery. For this he brings the milk from the depot, and delivers it in average lots of one pint to his customers. One wagon will make about 400 deliveries, equal to 200 quarts, in a day, and the waste of dipping 400 times in the can loses 10 per cent., so that $4,50 a day is not very liberal pay out of which to keep a horse, pay a man, lose 20 quarts of milk, and make a living for himself. The retailer, who is the most abused man in existence, and is often the suffering victim of prejudice, ill-will, and ignorance, is clearly not to be considered as an extortioner. The railroad companies fare the best; for the milk business avowedly pays them better than any other of their freights, while it is less costly. Doubtless milk might be carried 100 miles for half a cent per quart, which is 22 cents per 100 pounds, a rate for which freight may be carried 1,000 miles at a profit. But the railroad returns the empty cans free, which is to be considered. On the whole, some saving can be, and should be, made in the freight.

When one has a definite thing to contend with he may act with some satisfaction. But when everything is uncertain there is trouble. The bulk of the milk business is done in uncertainty. Those who have regular consignees under contract to take so many quarts daily, may be counted happy, with all their admitted troubles. But those who consign to a commission agent, like the troubled sea, never rest. These are the unhappy men. The agent may be honest and capable, but if milk comes pouring into the market in usual supply when from some unaccountable reason there is a greatly decreased demand for it, it may pour into the gutter and be declared sour; or the price may fall, as it sometimes does, to 60 or 75 cents a can of 40 quarts, or not enough to pay the freight. Then again, the market is full of irregularities. One commission agent may have, in the course of years, gathered up a business connection of a superior kind and can dispose of his milk better than another who deals with a poorer class of retailers. Everyone cannot get to the top of a ladder at one time, and the one at the top can hold his place against all comers.

To get hold of the best commission men is not easy. They are greatly sought after as a matter of course, and can get much more milk than they can dispose of. Sometimes when they are short, they fill out their supply from others, paying a little more than the ordinary rates, and in this and some other ways, some irregularity in price is unavoidable. When a short supply meets a good demand, milk will jump up to $1.50 or $1.75 a can, or even more; but one man may get the top price and another may not. All this is very unsatisfactory to the producer; but what can be done? After some experience in the business I am sure that there is as much honesty in the milk trade as in any other, and that the constant outcry of fraud and adulteration is made by persons who know nothing of what they are crying out about. But what shall be done to secure to the dairyman every cent which he ought to have?

I see only one way, and that is to make contract with dealers, if possible directly; and if it cannot be done directly, to organize local associations and have a special agent to receive and sell the milk in bulk; then every member is sure of having his milk sold and of receiving the highest possible price for it. Such associations now in operation are found to be very satisfactory and have done away with all trouble, so far as their members are concerned. A MILK PRODUCER.

PETITIONING CONGRESS AGAINST OLEOMARGARINE.

We have just received from Mr. Francis D. Moulton, President of the National Dairy Fair Association, the manuscript of the following letter intended to be sent to Congressman Thomas, of Illinois, together with that petition against abuses in the manufacture and sale of oleomargarine, given at length in our issue of April 22:

HON. JOHN R. THOMAS, House of Representatives
Washington D. C.

Dear Sir:—I send you by express to-day petitions signed by over twelve thousand dairymen and dealers in butter and cheese in the United States, praying for the passage of laws by Congress putting the manufacture and sale of oleomargarine under proper restrictions. Over 7,000 of these petitioners are residents of the State of New York which produces over half the butter and cheese made in the United States.

New York and other States have enacted laws on the subject; but they have proved ineffective. The manufacturers of oleomargarine have directly or indirectly evaded them, to the great injury, not only of producers of, and dealers in, natural butter, but also of consumers. The article has been sold under the name of butter and is being exported to the great injury of American dairy products in foreign markets. The question concerns every owner of the 13,000,000 milk cows in the United States, and of the land valued at over $1,300,000,000, on which they are supported. It affects an interest that has, within a few years, risen to the foremost place amongst our agricultural industries, and was fast outstripping all others. It affects a class of men who have proved themselves the most intelligent, enterprizing and thrifty of American citizens. It affects a branch of commerce which is paying annually many millions of dollars to the transportation companies of the U. S., and furnishes an important item of our exports. It affects an industry which, if properly protected and encouraged, will increase our exports more than any other article of American produce, it being within the powers of this country to supply the whole world with butter and cheese cheaper and better than can be made in any other country. The industry is more beneficial to the country than any other. Its tendency is to make every occupant of land its owner, to promote intelligence and advance the best interests of the country. The industry improves instead of impoverishing the land.

The followers of the dairy industry have never asked for aid at the hands of the Government, and only now ask for protection against fraud. They do not seek support against fair and honest competition; but they need the strong arm of the law to protect them from counterfeiting and dishonesty that affect the welfare of the whole country.

The question has attained national significance. In all sections of the country, the dairymen feel the effects of the evil and cry for relief. The agricultural and dairy press of the whole country is earnest in support of the dairymen's demands, and has raised its voice against the wrongs from which they suffer. All other means have failed to stamp out the fraud. The country now requires the adoption of such measures as will effectually cure the evil. I can hardly hope the full prayer of the petitions I send will be granted; but they serve to show how deep the feeling is, and represent the spirit of the people against the fraudulent sale of oleomargarine.

I would recommend the passage of a law, embracing the following features, which would be fair and safe for all concerned:—

1st. Prohibiting the admixture of other fats with butter, milk or cream for making any compound to be sold as butter.

2nd. Prohibiting the use of coloring matter to disguise the tissue fat of animals, manufactured for use and sold as butter or oleomargarine.

3d. Prohibiting the sale of oleomargarine as butter, and the use of the word, butter, in marking, branding, selling and shipping any other article than natural butter.

4th. Prohibiting the exportation of oleomargarine invoiced under any other name than oleomargarine.

5th. Prohibiting the use of ingredients other than caul fat of healthy beef cattle in the manufacture of oleomargarine or similar compounds intended for use as human food.

6th. Placing the manufacture and sale of oleomargarine, and other admixture of fat or grease offered for sale as food under the supervision of the National Board of Health, to prevent the use of refuse or diseased fats in its manufacture.

And including such other enactments as may be necessary for the full protection of all producers and consumers of legitimate articles. I also inclose letters on the subject, received from representative men in different parts of the country.

Hoping for your best attention and trusting that Congress will see the importance of immediate action, I am

Respectfully yours
FRANCIS D. MOULTON.
Pres. International Dairy Fair Association.

Miscellaneous.

WHAT OTHERS SAY.

THE CURCULIO.—From the agricultural columns of the N. Y. Tribune we take the following notes from an article by Prof. A. J. Cook: "Early in the season, if there are no weeds, grass or rubbish beneath the plum, peach or cherry trees, it will pay to lay pieces of board or bark or chips beneath the trees. The beetles will hide beneath these traps by day, and can be easily gathered up and destroyed. Mr. A. S. Dyckman, of South Haven, Michigan, whose plum orchard has been immensely profitable, states that this method saves him $300 annually over the old method of exclusive jarring. Mr. Dyckman uses oak-bark, places two small pieces beneath each tree, on opposite sides near the trunk, with smooth surface down. He employs boys to gather the insects, and pays them according to the number they find. This insures close examination. The curculios are placed in an open bottle, closed by the thumb of the one who is gathering them.

Often the character of the orchard precludes this method, and even when practised, it needs to be supplemented, late in the season, by the jarring or sheet process. This is not expensive, and often brings a tremendous profit. To practice this we have only to put a sheet—a white sheet is best—beneath the tree, and give the limbs a sudden jar. The little beetles fall to the sheet, when they can be caught and killed. For a few trees the sheets can be tacked or sewed to a cheap rectangular frame, with a narrow slit on one side, so that the trunk of the tree can be brought to the center of the sheet's surface. With but a few trees, two persons can carry this sheeted frame from tree to tree. In large orchards it can be placed on one or two wheels, when one person can easily manipulate it. The mallet should be of rubber, or else cloth-bound, so that in striking the branches they may not be injured. A sudden jar is what is needed to fell the insects. From several years' experience, I know that with caution no damage need be done.

The trees should be jarred very early in the morning, or just before dark, when the weevils are mostly in the trees. The jarring should begin as soon as the fruit sets, and continue as long as the insects are caught. The frequency of jarring, whether once or twice daily, or less, will be indicated by the success in catching the beetles. Let all remember that these little weevils are very small, and when they curl up to fall, look like dried buds, so that the inexperienced eye hardly sees them. Look very carefully, or you will be deceived in thinking that you are free from the pest, when, indeed, your trees are fairly overrun. A brother of mine commenced a few years ago to raise plums exclusively for the curculio. Not thinking this profitable, he began three years ago to use the sheet, and now he has plums "to sell and to keep."
